THE political sharps are reading election returns for straws which show the direction in which the national winds are blowing. Here is Ohio. By defeating the Taft bill two to one, the people have decreed that cities and other taxing districts must live within their income. Special levies were everywhere defeated, except for school purposes only. The campaign for higher debts and heavier taxes was backed by a strong press campaign, but the people appear to be making up their own minds. As to prohibition, Ohio remained "dry," defeating the mayors of towns which had become notorious for laxity of law enforcement, and preventing the attempted return to power of mayors who had been removed by Governor Donahay for failure to enforce the liquor laws.

There are two straws: economy and business sense in administration, and obedience to the law. That puts it up to both parties in a fashion that prevents either from taking any comfort from it.

He Left the Church

A GENTLEMAN recently in public life has resigned his membership in the church because of the political activities of the pulpit. The action is significant in that, generally, it agrees with a large and growing spirit of dissatisfaction among church members. It is significant also in that the statement in which the gentleman undertakes to describe what he understands Christianity to be, shows the lamentable failure of the church to teach its people what Christianity really is. This gentleman does not seem to know. The teaching function is all but dead in the American Protestant church. The wildest and most various opinions exist as to what religion consists in generally, and Christianity particularly. And this must be laid at the door of the Christian ministry which has left its main business of teaching to follow all sorts of things supposed to be useful or inspiring.

The modern prophet will certainly have somewhat to do with economics and politics, since these stand or fall by their morality, and Christianity certainly has its social implications. But not every minister is a prophet, nor even an understanding observer of local politics. The grievance of the intelligent churchgoer is not that the ministry gives itself so much to secular topics, but that it is generally so unfitted to handle such topics. The curse of "topics" has been the ruin of the pulpit. This year has seen a rush of ministers to Europe and every city in the country is deluged with series of sermons on European conditions, most of which are based on editorials in the London *Times,* interlarded with the hearsay and casual experiences of the hurried tourist. That is what makes the intelligent churchgoer "tired." He can get this sort of material, of much better quality and higher authority, elsewhere.

If only the ministry were expert in its own field, the condemnation of its aberrations would not be so severe. But churchgoers are beginning to suspect that the ministry is no more proficient in matters of religion than it is in international or local politics. In the Protestant church, for example, the textbook is the Bible, but an examination of the clergy in that Book would disclose fearful and wonderful conditions. It has fallen to the level of a motto-book, from which suitable passages may be selected to place at the beginning of sermons. The real cause of this, however, may be that an increasing number of ministers do not believe the Bible as the people understand believing it.

Since the Protestant church, as at present functioning, has elected to put the sermon at the front and center of its service, by the sermon it stands or falls. And as everyone knows, the vast majority of sermons today are neither literature nor religion. If the Christian church is looking for novelty, it might try Christianity—certainly the theme would be new to millions of its adherents.

Michigan and the Marines

THANKSGIVING weather, bright sun, blue sky, crisp air. A green field rimmed high with gray bleachers, vocal with the shouts and songs of fifty thousand spectators. Marines marching in to the music of massed bands—in solid standing block they fill half the field. A movement of troops, and a massive M is embossed against the green, a human letter of olive drab topped with blue. They wheel again and lift their Service Song, "The United States Marines," while fifty thousand stand uncovered.

Silence.

In the distance another band begins the reverent hymn-like "The Yellow and the Blue" and all Michigan it seems stands up and sings. Cheers from the Marines for Michigan; cheers from Michigan for the Marines. The flag goes up topmast, bugles flutter "To the Colors," massed bands and people take up "The Star Spangled Banner," soldiers at salute, civilians with uncovered heads.

Sharp blasts of the referee's whistle and the two lines are clashing. Baseball may be American, but football is the whole of Anglo-Saxondom's sport—it carries the fight into the opponent's territory; it is man to man, not bat to ball. It is individualism and collectivism mixed as life mixes them: you must play with the *team,* but no one matters so much as the *man* with the ball. In life no one tackles you until you have grabbed the ball, the symbol of possible achievement.

Right valiantly the two lines plunge and leap and wrestle. Yet tense as is the struggle on the green, and tenser still the partisanship of the crowds, there is everywhere like an unseen hand the restraining courtesy of American culture and sportsmanship. When Kipke of Michigan went down and lay there, the Marines saw only the play their man had made and were splitting the heavens with their cheers when down below a Marine officer's hand went up and instant silence fell. "He's hurt—don't cheer." The doctor ran from the side lines with his surgical case; two groups midfield stood still. Then up stood the Marine's cheer leader—"He's a damned good fellow and a great football player—Three Barks for Kipke!" To have heard the Marines "growl" and "bark" and "howl" is to know, apart from their fighting qualities, why they are called the "devil dogs" of the American forces.

The sun sinks low and early shadows are on the field when a shrill whistle calls truce, and Michigan runs off the field with their guests. The Marines are good losers—at football; and "on the land or on the sea" they know good sportsmanship.

As President, Washington Enforced the Law

THE call to enforce the Prohibition law recalls the story of the Whisky Rebellion in Eastern Pennsylvania during George Washington's term in the executive chair.

The upheaval was caused by a government tax levied against distilleries. President Washington himself took charge of the enforcement of the law.

En route west to the scene of the rebellion, President Washington was met by the officials and citizenry of Harrisburg, and their address of welcome was accompanied by resolutions of loyalty to the law he was enforcing. The address, too long for reproduction, teems with wrath at "unprovoked outrages committed by these lawless men, who are in opposition to one of the mildest and most equal of governments of which the condition of man is susceptible," and promises to do all in the power of the citizenry of Harrisburg to uphold the tax law and other laws of the land and "to support the happy Constitution and wise administration of our Government."

In Washington's day the struggle was to resist a tax upon distillers. The Government, after more than a century of tax enforcement, is now striving to abolish the traffic then recognized. In Washington's day, while the States were yet jealous of the rights reserved to them, the local governments thus upheld the Government in the enforcement of Federal law. Today, after taking the matter of sumptuary legislation away from the State, the national and local governments are "passing the buck" in enforcement.

Extend the Function of Propaganda

IT IS the history of privilege that it begins as the immunity or benefit of a few, and then, being right, extends to all people. All forms of liberty began as privilege, and ended as "common rights." So that in describing the propagandist efforts of the American Bankers' Association through the medium of an agency which supplies the smaller Press with material, we are not denouncing the practice as wholly bad, nor as necessarily bad. It is most excellent that economic questions are discussed before the readers of the rural press. The regrettable element is that the discussion is one-sided. The agency that supplies free to newspapers the official views of the bankers, would probably reply that if responsible persons holding opposite views would pay for the service, they too could have the freedom of the country press. To which, again, the reply would be that reformers seldom have large propaganda funds, and often no resources at all, save that best of all, an intelligent conviction.

All of this, however, regards the press agency as a printing business and not as an editorial responsibility. Let us say that it is right that the readers of the smaller newspapers should have the views of experienced bankers; is it not also right that the same readers should have the views of equally sound and successful business men who clearly see the deficiencies of the present system of finance and banking practice? That is to say, is there any economic question in which the people are so vitally interested as this machinery of exchange which is so often operated against their interests? Is it not only too evident that in everything written by the official propagandists of the money brokers, there will be utter silence with regard to the methods by which the system may be used against business and against the people? And should not the editor of a great press agency, with his millions of readers in mind, endeavor to give the very best of both views?

These are questions that are bound to come to the front. Propaganda will become suspicious whenever it is unbalanced by such facts as can be produced on the other side. The demand for a broader practice will probably come from the editors of the country press itself. Thousands of country editors, the mentors of unspoiled intelligence in the most American of American communities, will begin to say, "We don't object to letting the bankers have their say in our papers, but after all they are private business men who are interested in certain methods being continued, and if there is another side we should like our readers to have it."

That is the very probable turn which the controversy will take. Suppression of propaganda is not the cure, any more than the suppression of old-time privilege would have been the cure. Extension of the privilege of publicity is the cure. And it is as certain as that intelligence moves in a forward direction, that the editors of the smaller newspapers of the country will demand this extension.

What the Arabs Think of the Jewish Invasion

Investments of Immigrants Bring Fear and Hatred of Encroachment

By the REV. C. W. M. CASKILL

This is the second of two articles by the Rev. Mr. Caskill.

The Nebi Musa procession approaching Jerusalem. This impressive pilgrimage through Jerusalem is an annual event.

LET me state in the beginning of this article that I am not writing as a prophet, forecasting future events by any special divine insight. Neither do I draw my conclusions from consulting the book of any Old Testament prophet. Mine will be simply human conclusions drawn from personal observations as we traveled up and down over this little country and mingled with its people. So if my conclusions prove to be wrong, just remember that "to err is human" and let it go at that.

Before attempting to forecast the future and as a basis for that forecast, let me present as I see it what is the present religious status of the country. Three distinct religious groups are found in Palestine today. By far the largest and most widely distributed is the Moslem group. Probably nine-tenths of the people belong to it. As they have had, with the exception of less than a century of Crusade rule, uninterrupted possession of the land for more than a thousand years, they may properly be spoken of as the native population of the country. By far the larger part of the Moslems are Arabs who came originally from the deserts east of Palestine. The Turks who were the successors of the Arabs became the rulers of the country and continued until their rule was broken by Lord Allenby and his army during the last war. Since then most of the Turks have left Palestine, so that the present Moslem population is almost wholly Arab. Many of the Arabs, in fact most of them, welcomed the overthrow of the Turkish rule, and while today there is a big clamor on the part of many of them for the overthrow of the English rule, it is due very largely to the fact that they feel the English Government is trying to aid the Jews in getting hold of their country. This has direct bearing on the religious problem, but I will speak of that later.

For the most part the Arabs are a kind, open-hearted, hospitable people. We found them exceedingly friendly and cordial. They are, after a manner, faithful to their religion. They have their stated times of prayer, and on the streets, by the roadside, out in the fields, you may see them bowing with their faces to the ground. Many of the men carry strings of beads and everywhere you can see them fingering their beads, saying their "ninety-nine Allahs." While the Koran is their sacred book, they also accept the Old Testament and, in fact, claim that the Koran is founded upon it. So that to them, it is just as sacred, if not more so, than is their Koran. Hence the Old Testament characters and the Old Testament places are revered by them just as much as they are by the most orthodox Jews or the most devout Christians. The Mosque of Omar, one of the most beautiful sacred buildings in the world, is on the site of Solomon's Temple, and is as truly revered by the Moslems as it ever was by the Jews themselves. The tombs of Sarah, of Rachel, of David, and of many other Old Testament characters are in the possession of the Moslems, who have built sacred buildings over them. The burial place of Moses, next to Mecca itself, is the most revered spot in all the world to the Moslems, and especially to the Moslems of Palestine.

On Easter Sunday we stood for three hours and watched one section of the "Nebi Musa" procession as it entered Jerusalem on its annual pilgrimage to the sacred mountain of Moses. This section had come from Hebron. Several thousand were in it then. This would be added to all along the way, at Jerusalem, Jericho, and other places. Music, flying banners, groups of dancers, sword drills, fencing combats with long sabers and lances, songs and yells led by group captains carried on the shoulders of men—all this and much more, together with their fancy headdresses and costumes, went to make up the strange religious procession. When we saw them, some of the dancers had worked themselves almost into a frenzy. Their eyes glared and they looked wild. We were told that this increases as they approach their destination until some of the dancers become unconscious and have to be carried. At Jerusalem this whole crowd was taken to the court of the Mosque of Omar and given a feast. It takes several days for the pilgrimage to go from Hebron to Nebi Musa. The people walk all the way, sleep out-of-doors on the bare ground, and where they are not given food, as at Jerusalem, they buy what is necessary and eat as they go along. Once at Nebi Musa they spend a week in a great religious festival. I speak of this pilgrimage and of these Moslem buildings erected over the tombs of Old Testament heroes to show that all religions of Palestine are built upon one and the same book as a foundation—the Old Testament.

A second large religious group in Palestine is that of the Jews. Their national life ended with the destruction of Jerusalem by Titus and his Roman army in the year 70 A. D. A small remnant which survived the war and remained in Palestine revolted some fifty years later, and, under a pretended Messiah, attempted to throw off the Roman yoke. They were soon overcome and then by order of the Roman emperor Hadrian, all Jews were banished from Palestine. However, a few down through the centuries have found their way back, most of them settling in Jerusalem. Excluded by the Moslems from the temple area, they were and are still permitted to approach the outside of one small section of the temple area wall. This is the famous "wailing wall" of the Jews. Here some of the devout, who still look for the restoration of the Jews, gather each Friday afternoon and evening, and spend hours either reading Psalms, selections from the Old Testament Prophets, and specially prepared litanies, or else in caressing the stones of the old wall, wetting them with their tears, and filling the air with their lamentations and wailings. Since the English have come into power and not only religious liberty has been granted to all but special encouragement has been extended to the Jews large numbers have been immigrating to Palestine. While many are settling in and about Jerusalem and other Palestinian cities, many more are forming Jewish farming colonies, are buying up the land, and are establishing very prosperous and modern communities. There are probably today approximately one hundred thousand Jews in Palestine, and they are immigrating at a rate of about ten thousand a year. I understand immigration is limited on account of the fact that much larger numbers could not now be supported, so that even the Jews themselves are in favor of this restriction until development of the land and the establishment of factories can provide means of sustenance for larger numbers.

The religious life of the Jew is much today as it was when Palestine was his home. Animal sacrifice is not common now, and may never become so again, even were the Jews to gain possession of Palestine. But the Jewish Sabbath, the Passover, the washing of pots and kettles especially before the Passover feast, and the observance of the law of Moses, is little changed. We found a general and almost universal feeling among them that Palestine by right belongs to the Jews and ought to be the home of the Jewish people—not belongs to them in the sense that they have a right to take it by force or without compensation, but merely that they should be permitted to enter the country, buy land and stores, go into business, and ultimately to gain complete possession of this land that was once their national home. I asked many of the Jews if their people from England and America would come to Palestine if the door remained open. The universal answer was, No. All they hoped or planned was to make Palestine a home of refuge for the poor and persecuted of their race, at least this would be true for many years to come.

Closely related to the Jews and practically one in the nature and form of their religious worship is a very interesting although almost extinct body of Palestinian people, the Samaritans. According to the best information I could get there are now in existence not more than two hundred of these people—men, women and children—all told. They live in and about the village of Shechem at the foot of Mt. Gerizim. They have a very small synagogue, almost completely hidden, and very difficult to find without the aid of a guide. They possess a copy of "The Law of Moses," the first five books of the Old Testament, that is, the oldest copy of this portion of the Scriptures in existence. It is hand-written on old parchment scroll, and the Samaritan priests claim it was written within a hundred years of the time of Moses. We had the rare privilege of examining it, and it surely looked ancient enough. This small body of people still observe the Passover as an annual feast on the top of Mt. Gerizim, and animal sacrifice with all of its bloody accompaniment is carried out here each year just as it was by the ancient Jews.

The third religious group is that of the Christians. It is comprised of Greek and Roman Catholics and various Protestant bodies. I was not able to obtain the exact number of these but there were more than one hundred thousand. Catholics have been in Palestine ever since the time of Constantine. They hold most of the traditional sites connected with the life of Christ. The leading Protestant churches, aside from the Church of England, can hardly be said to have attempted serious missionary work. While some of the Protestant religious workers deserve the highest praise for their accomplishments, we were impressed with the fact that too many in and about Jerusalem are "millennium specialists," people who have come here expecting the end of the world soon and who were eager to be here on the ground floor. They have been more anxious to prove from prophecy that the millennium is near at hand than to work for the uplift and the saving of these people. One splendid religious worker said to us, "Jerusalem has become the

The Brilliant Morley's Place in History

English Statesman Regarded War as Barbaric, Without Redeeming Excuse

By ARTHUR GLASBY WALKER

WHEN Gladstone died in May, 1898, John Morley wrote of the event: "A great light has gone out of our national life." These words may be most justly employed of Morley himself now that he also has passed into the fascinating mystery of death. He had reached the ripe age of eighty-five years and for almost half a century his name had been a household word in his own land and a name of great account in English-speaking lands, and in fact through the world.

As statesman and man of letters he won the highest recognition, and has a sure place in history. He has enjoyed a unique and singular place in the affections of his countrymen. Greatly gifted, favored with public opportunities of which he made only the noblest use, he yet owed the secret of his power to something quite distinct and to something that is not invariably the attribute of those who enjoy a like degree of advantages in this unequal world. Gladstone was gifted and honored, yet always shrouded behind a veil of mystery; Beaconsfield was brilliant but always suspected; Chamberlain was clever but too potently ambitious to be trusted. Morley was the natural successor in the affections of the people of John Bright. "Honest John" was the enviable epithet which he early enjoyed and was strangely enough sufficient for all classes after he was raised to the peerage as before.

Morley an Agnostic Son

WHEN John Morley became Lord Morley of Blackburn, among the working people there was a deep-seated resentment. It was not that they begrudged him the honor, if there was any honor in it, for they counted him worthy of the best; nor was it that they feared that any title would change him, but they had a feeling that he rightly belonged to them and that this distinction was an attempt to steal him away from them. They considered him their particular own more than any man in public life—far more even than John Burns.

This is the more remarkable when one or two facts are recalled. In three vital things he was not of the people—in social level, in literary culture and in religion.

In a country where caste still is powerful it is an altogether unusual circumstance for the radical workers to elect to such a place in their regard a man so separated from them. Yet this they did, which is in the highest degree honorable to him and to them. Their belief in his moral integrity, humanity and practical friendship swept aside every other difference. They believed that in any circumstances John Morley would keep straight on. Now that his life is ended no single piece of evidence exists to falsify their judgment. Surely that is an achievement in the ordeal of prolonged public life spent in the full blaze of publicity in the highest places of public responsibility.

John Morley had an evangelical parentage. His mother was a devout Methodist. He confessed himself an agnostic. There was a time when his conscience caused him to write God with a small g. This fact would have been ruinous to Mr. Gladstone, at least his powerful following among the non-Episcopal churches would have dropped him. Certain earnest devotees of orthodoxy tried to raise a scare against Morley but it was received with cold indifference or scowling disgust. Capital G or small g they were convinced that an honest man is the noblest work of God and that Morley carried the hall mark of such workmanship. Anyone reading his reminiscences, particularly volume two, will find things that justify judgment. Children are admittedly great seers into character and the unsophisticated part of a population wonderfully retains that prophetic gift.

Morley was religious at heart while he was rationalistic in his head. In his life of Gladstone this often rests upon intimate tender passage like a delicate perfume. He deeply reverenced Gladstone's religion because it was so much like that of his mother. One of his tenderest bits of writing in that greatest of political biographies is the account of a Sunday evening spent at Harwarden—Gladstone's almost priestly sanctity, the reading of the Scriptures by one who loved what he read and in a voice more perfect for its purpose than that of almost any living preacher, and the quiet but fervent singing of the favorite hymns of the universal church.

His View of Labor Leadership

IN 1897, when visiting his political supporters, he spent September 30 on the coast of Kancardineshire. He says, "I banished politics and spent most of the day sauntering on the shore, with Wordsworth and Arnold in my pocket. Before I rose from bed I had read a little memoir of a pious woman who must have been a fine character. In one way it made me as remorseful . . . . But that cannot be helped. I, for one, am never really depressed or sad when something serious fills the mind." On the same trip he visited Montrose. He says, "I visited an independent minister, a young man fresh from Oxford and Mansfield, highly intelligent and cultured; knew six languages; regretted to be so far from center of intellectual or literary activity. Said I, 'but the only center of activity is your own study, whether Montrose, Oxford or London. Here or nowhere is thine America.' A banal bit of solace, but, as I'm always finding, the commonplace is the true essential. It did me good, though, to think of a bright light of thought, knowledge, interest, burning away on this far-off shore."

After gazing upon a wild wintry storm in Scotland he refers to Scott's description in an early chapter of "The Pirate" and says, "Not even Victor Hugo has surpassed it," and continues "This is the nature from which we came, to which we return. These are scenes that might well fill the inward eye in the last hours. We are one with all this—atoms in the wild whirl. Don't let us suffer it to be blotted out by wearying thoughts about our souls—and their shortcomings. They are not for a day like this. The vision purges as of self."

Ellis Griffith said of Morley: "He is Saxon in head and Celt in heart." This was true of him, and the common people early divined it. Labor men turned to him in their difficulties and always found both head and heart at their service. He was a spiritual democrat and longed for the liberation of the exploited and helpless, at least for such modifications in their lot as would make life worth living.

After an interview with six Labor delegates he wrote, "When will some man arise to lead and command Labor? I doubt if he will come from their class. Some man with Mr. Gladstone's genius, devoted to social ends."

Perhaps Morley's wish may be nearing fulfillment. How he kept near to the people was indicated when nearing the close of his distinguished service as Secretary of State for India he referred to the magnificence of the festivals at Simla in giving a farewell to Lord Minto. He and Minto had labored happily together and introduced reforms that made all India grateful to them. "But," said Morley, "it is no envious frame of mind that makes me thank the immortal gods that when the clock strikes for my final departure from Whitehall I shall fare forth solitary in a modest hansom."

A Brilliant, Powerful Thinker

NO LENGTHY reference will here be made to Lord Morley's literary activity and distinction. If in politics he was the successor of John Bright, in literature he was the heir of Burke. No one, knowing him and reading his admirable life of Burke, could fail to see this. All his work from 1867 onward marked him as a brilliant, lucid and powerful thinker. He claimed as his master John Stuart Mill, whom he resembled in the vigor of his logic, the catholicity of his culture and his almost poetic enthusiasm for the progress of the race. He edited the *Fortnightly Review* from 1867 to 1882, the *Pall Mall Gazette* from 1880 to 1883 and *MacMillan's Magazine* from 1883 to 1885. He was appointed Secretary for Ireland in 1886 and fought strenuously and faithfully side by side with Mr. Gladstone in the great struggle for Home Rule. He bitterly regretted its defeat, and was deeply touched by Mr. Gladstone's forced retirement from party leadership, but he continued his perilous and unselfish efforts for the pacification of Ireland. He was genuinely and heartily interested in the United States, to which country he paid at least two considerable visits. Being already a man of importance, he received considerable attention at Washington. In the Senate he had the privilege of listening to a fierce speech against his own country. He talked with Charles Sumner, with Grant and Sherman. No one in Washington, however, was of more interest to him than Walt Whitman, who was then a poorly paid clerk in the Attorney-General's office. Together they sauntered through the streets of Washington and discussed from every angle Whitman's doctrine of art without apparel, but Morley was unconvinced. Morley placed Whitman's workmanship very high, but felt that Emerson, Hawthorne, Holmes and their school had some of the real secrets of life and nature to tell. Referring to this he said, "I was content to stop at Emerson and have not been less content as the years have passed.

"Thoreau had quitted his place in American life a few years before. Else I should have sought a sight of that clear-eyed and untrimmed embodiment of the life with nature on which men muse when they are sick of convention and imposing drapery." He was wise enough on this visit to leave the country without venturing a single idea of the institutions of America, their durability, or the pattern they were destined to supply for democracy in Europe. His next visit was in 1904. Thirty-six eventful years had passed both to him and to the United States.

"Roosevelt and Niagara"

IN THIS visit he arrived with the Carnegies with whom he had been staying at Skibo Castle, Scotland. Matthew Arnold had introduced "Andrew" and "John" twenty years before and the friendship had grown with the years. Morley says of Carnegie, "His extraordinary freshness of spirit easily carried Arnold, Herbert Spencer, myself and afterward many others high over an occasional crudity or haste in judgment such as befalls the best of us in ardent hours. His passion for Peace and his Gospel of Wealth could not be escaped. He was an idealist who lived and worked with his ideals, and drudged over them every day of his life." Of work he said, "It is not so much for a superior man that he suffices for his day's work, as that his day's work suffices for him." "Carnegie didn't fire men out—he fired them with sympathy for the scheme."

The day he was in Chicago was an intense day in politics. That day Roosevelt won his famous landslide victory. Next day Morley reached Washington as the guest of the conquering hero at the White House. He enjoyed Roosevelt immensely. On leaving for England a great crowd of newspapermen besieged Lord Morley with the usual type of question: "What is it that impressed you most during your visit?" To which he made the true and sagacious answer: "Undoubtedly two things, the President and Niagara Rapids."

He was a convinced pacifist. He regarded war as barbaric with not a redeeming excuse and as a reproach to the self-constituted leaders of nations in an age making such arrogant claims to enlightenment. Hence he sternly opposed Chamberlain in the Boer War, and when the catastrophic plunge of 1914 occurred, he, with John Burns, retired from the Cabinet.

Of honors he had all that a man might reasonably covet. The highest responsibilities of the Empire were in one way or another intrusted to him. The coveted D.C. L. of Oxford University was given to him. Carnegie gave $250,000 to establish a chemical laboratory in Manchester conditional upon its carrying the name of John Morley. In literature he was honored throughout the world. From 1838 to 1923 is a long time as men count life. It is fair to say that he lived through the most remarkable eighty-five years in the history of the world. He took his part nobly. Best of all, the sobriquet "Honest John," spontaneously given to him by the common people forty years ago, he carried as a white flag, without the slightest suggestion of a stain, flying till the sun of his life sank into the purple West.

Offering Soul Insurance to Hotel Guests

Concluded from page 2

to the new organization. It was decided to give the incipient organization a national aspect by holding a national convention. It was convened at Waukegan, Illinois, June 30 to July 1, 1900. It was at this gathering that the idea of placing a Bible in the hotels patronized by the Gideons germinated. C. L. Kittridge, of Waukegan, Illinois, proposed the following resolution:

"That every hotel that Gideons patronize, furnish a Holy Bible for the benefit of its patrons."

Already the organization had grown to 600 and new members were joining every day. The Gideon organization is interdenominational. According to the by-laws of the order, any man whose chief occupation is traveling for commercial business, who believes in Jesus Christ as the eternal Son of God, accepts Him as the personal Savior and endeavors to follow Him in his daily life, and who has belonged for three months or longer to some local church that makes such belief and endeavor a condition of membership, may become a Gideon by pledging himself to wear the Gideon emblem, and complying with the by-laws governing applications.

"The object of the Gideons," as explained by A. B. T. Moore, national secretary at Chicago, "is to improve every opportunity for the betterment of the lives of our fellow travelers, business men and others with whom we may come in contact.

"Not until the organization of the Gideons was any concerted effort ever made for the moral uplift and salvation of the traveling man. It is now the only association that is trying directly to bring the gospel of Christ and his salvation to commercial travelers, as such.

"It is estimated that there are more than 700,000 commercial travelers in the United States, of whom probably not more than twenty per cent are avowedly Christian.

"Only a small portion of this number have so far been persuaded to join in this needed and specific effort in Christian service. We are using our best endeavors to bring them to active co-operation and we urge all Christian forces to help us to this end.

"No other class of men has such great opportunities for good or evil, and no occupation for men requires more positive qualities of character to bring success than theirs. As the commercial traveler has often been called 'The spinal column of commerce' because he is a power in the commercial world, so he is, when a Christian, a most persistent, aggressive force in the church."

"More than five hundred and fifty thousand Bibles have been placed in the hotel bedrooms of America and large numbers are added each month."

Not more than three or four of all the vast number of Bibles distributed have ever been stolen. One was purloined by a colored elevator boy, who swore on the witness stand that he took the Bible home with him because he found it was such an interesting book that he wanted to finish reading it.

From the humble beginning a quarter of a century ago, several thousand traveling men have been brought into the association. Field secretaries work in the cities soliciting funds and making arrangements for the introduction of Bibles in hotels not supplied. Every year marks a new bench mark in the progress of the order. Every Gideon is a missionary; a lay apostle spreading the gospel of a better life.

"And they stood every man in his place around about in camp."—Judges 7:21.

This is the Biblical slogan on their literature. Within this Scripture they find a union of strength for their ideals.

The Most Distinguished Farm Girl

Peggy Keith of Virginia Is Queen of Every Agricultural Club Project Organized by Uncle Sam

By GEORGE H. DACY

AFTER competing with 600,000 boys and girls who belong to agricultural clubs in all parts of the United States, Peggy Keith, of Warrenton, Virginia, has been proclaimed by the United States Department of Agriculture "America's most distinguished farm girl," the highest title in Uncle Sam's power to bestow on the farm girls interested in the improved methods of farming which he advocates.

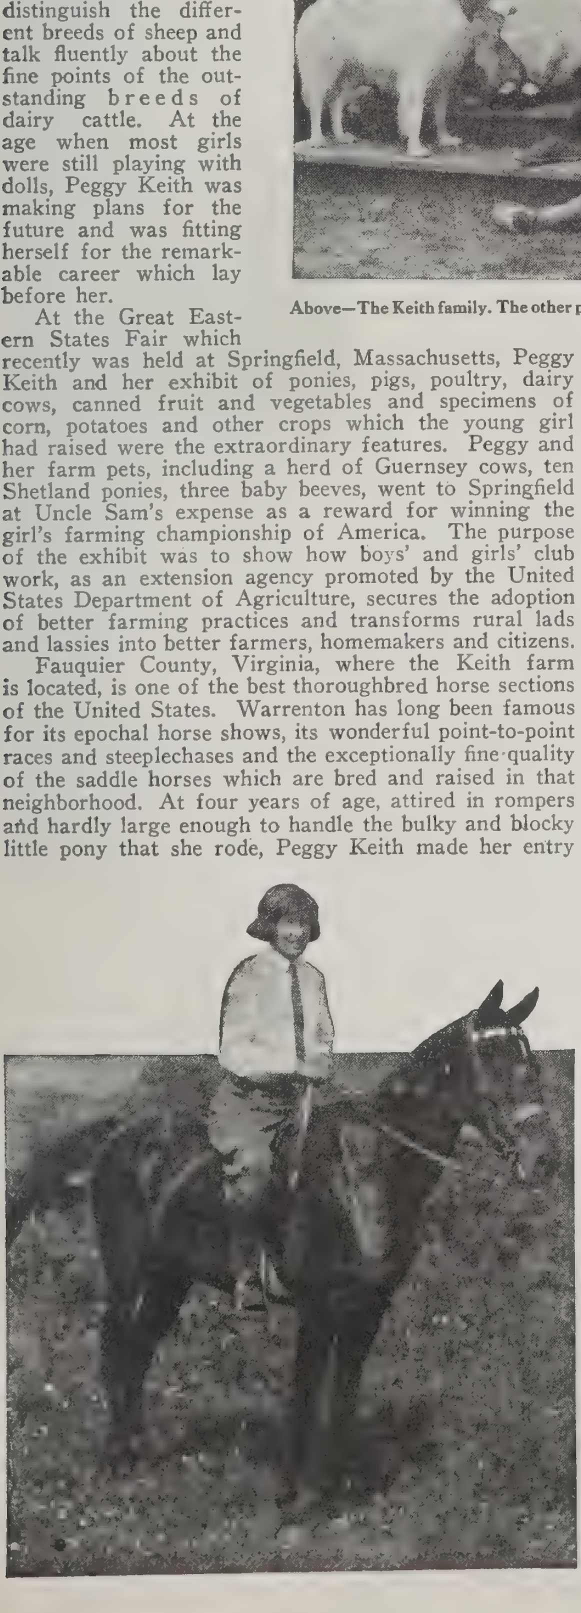
If ever there was a one-hundred-per-cent farm girl, Peggy Keith is that selfsame miss. She knows how to farm. She understands the science of technical agriculture. She can nurse a sick cow or a delicate pig back to health. She is qualified to act as an experienced live stock judge at any stock show or fair in America.

Above—The Keith family. The other photos show Peggy with four prize winners.

Eight years ago a visitor to the Keith farm sought to buy a dozen pigs. Peggy was then only seven years old but she was sharp as a Damascus saber when it came to a matter of selecting the best pig in the litter. She knew saddle horses as well as the visitor knew the alphabet. She could distinguish the different breeds of sheep and talk fluently about the fine points of the outstanding breeds of dairy cattle. At the age when most girls were still playing with dolls, Peggy Keith was making plans for the future and was fitting herself for the remarkable career which lay before her.

At the Great Eastern States Fair which recently was held at Springfield, Massachusetts, Peggy Keith and her exhibit of ponies, pigs, poultry, dairy cows, canned fruit and vegetables and specimens of corn, potatoes and other crops which the young girl had raised were the extraordinary features. Peggy and her farm pets, including a herd of Guernsey cows, ten Shetland ponies, three baby beeves, went to Springfield at Uncle Sam's expense as a reward for winning the girl's farming championship of America. The purpose of the exhibit was to show how boys' and girls' club work, as an extension agency promoted by the United States Department of Agriculture, secures the adoption of better farming practices and transforms rural lads and lassies into better farmers, homemakers and citizens.

Fauquier County, Virginia, where the Keith farm is located, is one of the best thoroughbred horse sections of the United States. Warrenton has long been famous for its epochal horse shows, its wonderful point-to-point races and steeplechases and the exceptionally fine quality of the saddle horses which are bred and raised in that neighborhood. At four years of age, attired in rompers and hardly large enough to handle the bulky and blocky little pony that she rode, Peggy Keith made her entry into the exhibition world. Piloted courageously by the diminutive Peggy, her pony, Corinne, was awarded the blue ribbon in the Shetland class. From that day to this, Peggy has been winning competitions, titles, trophies and prizes. Peggy Keith has won twenty silver cups, several hundred dollars in cash prizes and more than fifty blue ribbons at horse shows and agricultural fairs where she has exhibited her championship stock. For three years, she has paid all her school expenses and has financed her farming operations from money which she has earned.



One of Peggy's greatest inheritances is her ability to judge. Among her ancestors are listed many famous judges of Virginia. Parson James Keith, a notable during the early days of Virginia history, was one. He was grandfather of Chief Justice Marshall, whose fame will endure as long as there is a native Virginian. Peggy's grand uncle was Judge James Keith, president of the Old Dominion Court of Appeals. Peggy today ranks as the leading juvenile judge of live stock in the United States, another example of the old saying in Virginia that blood will tell.

Seven years ago, Peggy joined the boys' and girls' agricultural club of her neighborhood and grew her first crop of potatoes. She did all the work. The following year, enthusiastic over the agricultural club work, Peggy prepared the land and planted one acre of corn in competition with the other club members of her county. Unfortunately, cattle destroyed most of the corn. Peggy grew another acre of corn the following season, and harvested seventy-five bushels from her prize-winning plot.

When eleven, Peggy joined the Fauquier County Canning Club, grew one-tenth of an acre of tomatoes and pickled twenty-four quarts of green tomatoes. She studied modern canning so efficiently that for two years she canned fruit and vegetables which she exhibited and won the majority of the awards at the local county fair.

As appropriate side lines to canning activities, Peggy also engaged in poultry and baby beef production. She started operations as a poultry raiser four years ago with but one setting of eggs. Today, she has a flock of sixty standard-bred Langshans and forty Rhode Island Reds which furnish the eggs and poultry for the Keith family table and yield to their juvenile owner a tidy annual income. During the winter and spring of 1919, young Miss Keith fed two Shorthorn steers very successfully and sold them for top prices. In 1921, she fed a Hereford beef calf which made a record gain of 400 pounds and won first place at the Virginia State Fair.

Peggy Keith learned the essentials of live stock judging at a short course in agriculture conducted in 1920 by her state college. The following year, she was selected to represent her county on a judging team at the state fair. The next year she was a member of the team that represented the Old Dominion at the national boys' stock judging contest held at Atlanta. There were fifty boys in the big judging match. Peggy was the only girl. Largely through her efforts, the Virginia team won second honors.

Last summer at a county fair in Virginia, a county agent whom Peggy knew was assigned to judge all the live stock exhibits. He called Peggy to assist him. The girl did not make a single error.

Peggy Keith aided in the organization of the first pony club in America and now she is president of the unique association. The members are all youngsters who own ponies. Each summer, they have a pony show managed by juveniles which attracts many visitors from Washington, New York, Philadelphia and Boston. Many other pony clubs have recently been organized and all are outcrops of the Warrenton club.

Whenever her parents wish to buy any dairy or beef cattle, they ask Peggy to accompany them. Not only is she a good judge, but she also has achieved considerable success as an amateur veterinarian and stable nurse.

One of her purebred Guernsey cows which she purchased with money that she saved from her farming enterprises contracted pneumonia last winter. Peggy swathed the body of her valuable cow in mustard plasters. Night and day while the crisis lasted, she stayed in the barn at the side of the cow. The local veterinarian says that credit for saving the animal's life is due more to Peggy's care than to his pills and poultices.

Peggy's farm of pets now includes a string of twenty Shetland ponies, many collie dogs and an important interest in her mother's herd of seventy-five full-blood Guernsey cows.

M. O. 4 and Its Part in Chronicling the Truth

Branded by Lasker When He Took Office as "Shameful Chicane,"

But Was It Changed? It Was Not—and Here's the Story of the Details

By a Washingtonian

This is the fourth of several articles having to do with conditions in the United States Shipping Board. Another will appear in an early issue.

THIS is a chronicle of the neglected truth about the infamous "M. O. 4."

During the war the ship speculator took full advantage of his influence to promulgate, first, "M. O. 1," which, translated, means "Managers-Operators Agreement No. 1," then M. O. 2, which gave the ship operator more chance to make profits—and the government less chance to get anything but losses—than under M. O. 1. Then followed M. O. 3, which added still more to the profits of the speculators—and finally the infamous M. O. 4—the climax of this whole series of agreements in which each succeeding one took more from the treasury and poured it into the coffers of the private operators than the preceding one.

Is the M. O. 4 infamous?

Let Albert D. Lasker, then chairman of the Shipping Board, tell, as he told Congress, what it is:

". . . . the Shipping Board devised a plan of leasing the boats known in the Shipping Board and throughout the shipping world in America as the M. O. 4. . . . . It has turned out to have been as vicious and incompetent a basis of doing business as the human mind could devise, and it was all that was needed to make this sick business infinitely sicker."

That was in July, 1921. And again, later, said Lasker:

"The contract is the most shameful piece of chicane, inefficiency, and of looting the Public Treasury that the human mind can devise . . . . We have heard of cases where the operators organize stevedoring companies and then they charge us with any price they want and then they get five per cent on the cargo; that is to say, they increase our loss for the carrying of the cargo by the inflated profit made by the stevedore."

Operators Couldn't Lose

COMMANDER Richard D. Gatewood, head of the repair department of the Shipping Board told Congress in 1921:

The Chairman—"What necessity was there so long as they were getting five per cent on the gross revenues?"

Commander Gatewood—"I am very glad you asked that, because it gives me a chance to say this about this five per cent gross revenue thing. Prior to the present agreement there was another agreement, a managing agency agreement, called M. O. 3. . . . . Under the previous agreement—and we are paying some of the bills away back under that agreement—the operators got a percentage of the net."

The Chairman—"There was some sense in that."

Commander Gatewood—"In the net, yes, sir; but when the slump came along, the operators refused to participate in the net losses, which they anticipated would be heavy, and it was primarily for that reason that another agreement was entered into."

The Chairman—"Under the agreement you finally entered into, there was no chance for them to lose and no chance for the government to win."

Under this M. O. 4 agreement which Al the "ad" agent from Chicago and Commander Gatewood so roundly condemn, the operator gets "five per cent on gross outward freight, dead freight, demurrage, express and mail revenues: Provided, That two and one-half per cent only shall be paid on full cargoes of coal, grain, sulphur, and phosphate," and so forth. "Two and one-half per cent gross inward freight, dead freight, demurrage, express, and mail revenue, the minimum inward fee at each port, where cargo is discharged to be $250."

In addition to which the operator buys all the provisions—from subsidiary concerns owned by himself, if he chooses, as in many cases he does, charges any price he pleases, approves his own bills—and the government pays them.

For the Farmers to Think About

SO, AND numerous cases are in the records, the private operator can make as much money on a partial cargo as he can on a full one, he can send a ship around the world or to a foreign port knowing she is going to lose money—yet he gets a profit from the gross revenue—and the government pays the bills—and takes the losses. In one case an operator called his ship back from some two thousand miles at sea to take on additional cargo, the revenue from which would not pay a fourth of the cost of turning the ship around—yet he made money from the transaction—and the government lost heavily. That was the rule.

Ponder that, you farmers of the South and the Middle West. And you, Mr. Business Man, wondering how you are going to carry the burden of taxation, ponder the gentlemen operating your ships, actually cashing millions on your losses—and you will begin to get some understanding how this Shipping Board has drained your pocketbook—while millionaires multiplied.

Now note how Al, the "ad" agent, chairman of Shipping Board—brought from Chicago to GET THE PEOPLE out of the Shipping Board mess at the least loss, took charge of the private operator and his surething scheme against the government in this exigency.

Mr. Lasker, almost a year later—January, 1922—was not as denunciatory in his language concerning M. O. 4, when he again appeared before a Congressional committee:

Mr. Wood—"Is the M. O. 4 system still in effect or have you changed to some other plan?"

Mr. Lasker—"Market conditions controlling our export trade during the past year have not been favorable to any change in our method of handling government-owned tonnage from the M. O. 4 agreement. The general market at no time reached a point where tonnage could be operated at a profit in the over-sea trade, and there was, therefore, no inducement for private operators to charter our government-owned steamers. . . . . Any change in this respect will be largely influenced by the action taken by Congress on the subsidy bill." In other words, Lasker was telling Congress it could either vote the subsidy or continue to let the country be robbed under M. O. 4.

And he said further:

"I do not want to be understood by this as favoring the M. O. 4 system, which I always felt, and still feel, was not an ideal system or by any means the best one that could have been devised." (He has changed his tune now from "vicious, chicane, looting the Public Treasury," to "not an ideal system," "not the best method," and so on.)

What Lasker Said About M. O. 4 in July, 1921

"The contract is the most shameful piece of chicane, inefficiency, and of looting the Public Treasury that the human mind can devise . . . . We have heard of cases where the operators organize stevedoring companies and then they charge us with any price they want and then they get five per cent on the cargo; that is to say, they increase our loss for the carrying of the cargo by the inflated profit made by the stevedore."

What Lasker Did About M. O. 4 in the Next Year

NOTHING——

Except to call the agents of the vessels together a year after to tell them that the Shipping Board in future, it had been decided, would pay even more money than was called for under the infamous M. O. 4. Despite his bragging of a year before that the bare-boat charter would be substituted for M. O. 4 it was not done. WHAT MR. LASKER DID A YEAR LATER WAS TO MAKE IT POSSIBLE FOR THE SHIP LESSEES TO OBTAIN AN ADDITIONAL SUM ESTIMATED AT $1,200,000 ANNUALLY.

Representative Ewin L. Davis, of Tennessee, told the House what Al did about this iniquitous M. O. 4.

"Chairman Lasker testified at hearings before a subcommittee of the House Appropriations Committee July 7, 1921, and described this M. O. 4 contract as follows:

"'The contract is the most shameful piece of chicane, inefficiency and of looting of the Public Treasury that the human mind could devise.'

"Later Chairman Lasker gave out a statement which was carried in the Associated Press, August 19, 1921, the article stating in part:

"'Decision to substitute a bare-boat charter for the system under which practically all Shipping Board vessels are now operated was announced last night by Chairman Lasker after a conference with President Harding. Instead of the boats being turned over to operators on a five per cent commission basis, it is the board's intention to adopt a uniform charter, under which the vessels will be leased on a tonnage basis, the lessee assuming the same risks of profit or loss as he would under the routine commercial charter.'

Not Changed by Lasker

"HOWEVER, Chairman Lasker has not changed any of the existing M. O. 4 contracts. While he laid up a large number of ships, yet those which were permitted to continue in operation were permitted to continue under M. O. 4 contracts, which Lasker described as above stated; and he was doubtless correct in his characterization. They have changed no M. O. 4 contracts to bare-boat charter contracts, although this great advertiser announced to the world more than a year ago he was going to make such a change.

"He has not only not made such change, but he called the managing agents of Shipping Board vessels together in Washington, June 21, 1922, and voluntarily adopted and announced a policy of paying such managing agents additional compensation in the shape of husbanding fees, under which, since that time, operators handling five vessels or less receive $400 a month per ship in addition to the regular commission previously paid, and operators handling up to 10 vessels receive $400 a month per ship for the first five ships and $250 a month for each additional ship. It was announced by the Shipping Board at the time that this allowance of husbanding fees would add $1,200,000 annually to the cost of operations, but it was estimated that more than this amount would be saved by the new arrangements for subsistence—the allowance for subsistence being reduced from eighty to sixty-five cents a day per man at that time—stevedoring and general supplies."

"Why should not the taxpayers have been given the benefit of such savings? Why were these additional bounties voluntarily given the managing agents?" reasonably inquires Mr. Davis—and the answer never came.

What the Arabs Think of the Jewish Invasion

Concluded from page 9

dumping ground for all the religious cranks and fanatics and isms of the world."

Looking at the religious future of Palestine in the light of its present religious status only two things, it seems to me, are possible: either the Jews will gradually get possession of Palestine and make it a Hebrew nation, or else the Arabs will practically accept Christianity and the Christian civilization and thus be able to perpetuate themselves in this, their own land.

The Jews are investing large sums of money on improvements and are contemplating buying up all the natural resources of the country that they can get hold of. In fact, their plan is, as I have said, ultimately to make Palestine the national home for the Hebrew people. And unless the Arabs can find a way of stopping the inflow of Jews, this will undoubtedly become an accomplished fact.

The Arabs recognize this. They are fully aware of the purpose of the Jews. They see their gradual encroachment, and they look upon it with mingled feelings of hatred and fear. The younger and more progressive business Arabs are gradually awakening to the fact that they have neither the money, the ability, the shrewdness nor the leadership to compete with the Jews. They realize the hopelessness of resorting to arms to keep out the intruders, as they call them. They cannot prevent their people from selling the land when the Jews offer exorbitant prices for it. They are beginning to awaken to the possibilities in some of the natural resources of their country, but they realize that they have neither the capital nor the ability to develop these resources and so they are compelled to stand by and see them handed over to Jews or Jewish firms.

It is positively pitiable to see the mingled feeling of helplessness, fear and hatred on the part of the young Arabs toward the Jews. I sat for two hours in the home of one of the brightest young business men of Palestine. Three other keen young business men and two young Arab women were there. How they plied me with questions, and how eagerly they listened as I told them of the possibilities and opportunities that I saw for the future Palestine. Then what a look of dejection and almost hopelessness came over them as they said to me: "But we cannot compete with these Jews. We cannot farm the land and make it produce as they can. We cannot go into business and succeed as they can. We have not the capital nor the leaders to cope with them." I replied, "But your young men are as bright and as keen as any Jews." They responded, "Yes, but we do not know how. We lack leaders. Our people are not trained."

Combined Moslem and Christian clubs are being formed in many places in Palestine to combat the Jewish plan of taking Palestine. In the great Nebi Musa procession we often heard the cry, "Long live the Moslems and the Christians. Down with the Jews." In personal conversations with the Arabs we found them invariably kindly disposed toward the Christians but with bitter hatred toward the Jews.

If the churches will send over to Palestine some of their strongest and ablest leaders, men with big hearts and big brains, who will become the unselfish advisers and leaders of these young Arabs, not only along religious lines, but along business, commercial and political lines; if the churches will found industrial and agricultural schools and colleges where these bright young Arabs can be trained so that they can compete with their rivals, they will assist in the settlement of a grievous problem in the only way it can be permanently settled, on a basis of justice.

The Fair Valuation of Public Utilities

What Method Is to Be Pursued in Determining Fair Purchase Price?

By the REV. JOHN A. RYAN, D. D.

Substance of a paper delivered before the Public Ownership Conference at Toronto

PUBLIC ownership of public utilities implies for the most part public purchase of existing concerns. Occasionally a city establishes a new system, such as the municipal street railway in San Francisco, or the municipal lighting concerns which several cities have set up in competition with privately owned concerns; but this method is costly, wasteful and undesirable, except as the smaller of two grave evils. If public ownership is to obtain any considerable extension it should take place through purchase, and the purchase price should be just; that is, it should be fair to both the utilities and the public.

This raises the question of the method by which a fair purchase price is to be determined; in other words, it is a question of valuation.

It ought not be necessary to point out that the value of a public utility is not and cannot be determined in the same way as the value of a house, a factory, or any other article which is the subject of frequent purchase and sale. Goods of the latter kind have a constant market value which is determined immediately by earning power and ultimately by competition. The value of a public utility is immediately determined by its earning power whenever there is question of purchase by private persons or corporations; but the earning power is dependent, not upon competition, but upon the charges fixed by the public authority. These are regulated by the public valuation. In brief, the value of a non-public utility depends ultimately upon competition, while the value of the public utility depends ultimately upon the valuation which the public commissions and the courts regard as fair. Hence, the value of a public utility is primarily an ethical concept; the value of other property, at least as the term is commonly used, is primarily economic.

Many Millions Involved

VALUATION of a utility for the purpose of fixing a purchase price is not quite the same thing as valuation with a view to determining charges for the service performed by the utility. "Rate-making values property not to determine a price to be paid for the property itself, but to fix the reasonable cost of the service it helps to render. Condemnation proceedings value property to estimate the reasonable price to be paid for the property itself." (Hartman, *Fair Value*, p. 71.) That is to say, the two kinds of valuation are differently regarded and estimated in legal theory and practice. If a city were to take possession of a privately owned street railway by condemnation proceedings it would be required to pay for increases in the value of the land and also for the franchise value, in case the franchise had not yet expired. In rate-making valuations, public service commissions have generally, and the courts sometimes, ignored both these elements. Nevertheless, the decisions of the courts with regard to valuation in rate-making cases are applicable to the majority of the problems which would arise in connection with valuation for purchase.

It is not necessary to explain the importance, legally, economically and ethically, of the valuation problem. It involves possibly millions upon millions of dollars in the public utilities of the United States. For example, Mr. Donald R. Richberg estimates that the difference between the value put upon the railroads by their owners and the value attributed to them by the advocates of the original cost theory amounts to ten billion dollars. Without accepting or rejecting this estimate, we cannot fail to realize that the difference is enormous, both in the case of the railroads and in that of municipal utilities.

The final authoritative decision of this question will, of course, be rendered by the courts. With them lies the answer to the question whether the fair value of public utility properties, for public purchase as well as for rate-making, is original cost or present reproduction cost or some compromise between these two measures. Nevertheless, it is desirable that the courts of justice should render just judgments. Hence, they ought to receive all the assistance and enlightenment that can be obtained from any honest and competent source. The assumption that the courts are susceptible to education in this field is antecedently reasonable and has the support of experience. In the *Munn Case*, decided in 1876, the attorneys for the utilities contended that the "due process" clause of the Fourteenth Amendment was applicable to rate-making and gave the corporation protection against unduly low rates. The United States Supreme Court flatly denied this claim, holding that reasonable compensation for the use of property and reasonable rates were not judicial but legislative questions. A few years later the Supreme Court again rejected this argument of counsel for the utility, and reaffirmed the supremacy of the legislature. Nevertheless, the doctrine then advanced by the utility lawyers has since become the doctrine of the courts.

This bit of history is adduced, not to criticize the change in judicial attitude nor the present judicial application of the "due process" clause to rate-making, but to show the possibilities of judicial education. The advocates of public ownership should not neglect these possibilities. They ought to make known to the courts and to support with adequate argument their views concerning the fair value of public utility properties.

Both in the formation and in the advocacy of their views on valuation, the champions of public ownership should strive to be scrupulously just to the corporations as well as to the public. "Strive" to be just, because the attainment of exact justice even in one's opinions, is beyond the finite and fallible powers of human beings. The best that we can do is to be honestly desirous of taking an impartial attitude, and sufficiently patient and painstaking to consider all the relevant facts.

The outstanding difference between most of the advocates of public ownership on the one hand and the utility owners on the other with regard to the fair value of these properties, arises from the theories of valuation which they respectively defend. At the present time, the former generally adhere to the theory of *original cost,* while the latter generally prefer that of *present reproduction cost.* Formerly their positions were reversed. "The adoption of present value of the utilities property as the rate base," says Justice Brandeis in his dissenting opinion in the Southwestern Bell Telephone Company Case, "was urged in 1893 on behalf of the community; and it was adopted by the courts largely as a protection against inflated claims based on what were then deemed inflated prices of the past." In other words, the public then advocated reproduction cost because it was lower than original cost. Owing to the rise in prices which has taken place since 1914, reproduction cost is now higher than original cost in the case of all public utilities established before that date. Hence, the champions of the public and the advocates of public ownership defend a measure of valuation which they formerly rejected, and reject the one which they formerly defended. On the other hand, the public utility corporations have undergone a corresponding reversal of positions, and for a similar reason. They now advocate present reproduction cost because it would give their property a higher valuation than original cost. Human nature being what it is, the changed attitude of both parties is entirely natural. No greater reproach is due to one than to the other.

The question who is for or who is against either theory of valuation is entirely irrelevant. From the viewpoint of ethics, the important question and the only important qustion is, which theory is just? Or whether justice requires that both methods be used in arriving at the proper valuation of a public utility.

Let us see what light has been thrown upon these questions by the decisions of our courts. Reference is, of course, to the courts of the United States. While we are unwilling to concede that the voice of the court is the infallible voice of absolute justice, we have to accept three important facts. First, our courts have, by a gradual development of legal doctrine in the last forty years, accepted the authority and responsibility of giving final judgments concerning the fair and reasonable valuation of public utilities. Second, the ethical pronouncements of the courts on this subject do deserve a considerable amount of respect, even though they are obviously not infallible. Third, since the determination of the fair value of public utility property has become the unquestioned function of the courts, that legal situation has to be accepted unless and until it be changed by an amendment to the Constitution.

Decisions Are Cited

AT PRESENT, and probably for several years to come, the judicial measure of fair valuation is that complex rule laid down in the case of *Smyth v. Ames* (1898). "And in order to ascertain that value, the original cost of construction, the amount expended in permanent improvements, the amount and market value of its bonds and stock, the present as compared with the original cost of construction, the probable earning capacity of the property under particular rates prescribed by statute, and the sum required to meet operating expenses, are all matters for consideration, and are to be given such weight as may be just and right in each case. We do not say that there may not be other matters to be regarded in estimating the value of the property."

In this enumeration by far the most important factors are the original cost of construction and the present cost of construction. Both of these "are to be given such weight as may be just and right in each case." How much weight is just and right? Neither in *Smyth v. Ames* nor in any subsequent decision has the Supreme Court set up any definite rule, test, or standard by which this question can be answered. One thing is certain, full weight cannot be given either original cost or reproduction cost when they are represented by different figures. In the *Bluefield Water Works* Case, decided by the Supreme Court June 11, 1923, the present reproduction cost of the utility was almost twice as great as its original cost. Obviously, both figures could not be accepted as describing the fair value of the property. One must be taken to the exclusion of the other, or some figure between the two must be accepted. The latter choice is the one that seems to be suggested by the language of *Smyth v. Ames,* and apparently it is the one that has been most frequently followed in subsequent decisions. To give "such weight as may be just and right" to original cost and to reproduction cost, means in practice, therefore, to arrive at some kind of compromise between these two factors.

At what point the compromise will be effected, whether midway, or nearer to original cost, or nearer to reproduction cost, cannot be determined beforehand. Neither by any formal rule nor by any general practice has the court indicated an answer to this question. All that we can say with certainty is that the court will give some weight to reproduction cost when it differs from original cost. This is clear from several decisions subsequent to *Smyth v. Ames.* In *Willcox v. Consolidated Gas Company* (1909), the court said: "If the property, which legally enters into the consideration of the question of rates, has increased in value since it was acquired, the company is entitled to the benefit of such increase." In the *Minnesota Rate Cases* (1913), it was held that "the making of a just return for the use of the property involves the recognition of its fair value if it be more than its cost." Here is a clear intimation that the original cost may be less than the fair value. Three cases recently decided by the Supreme Court exemplify the same doctrine. In the *Southwestern Bell Telephone Case* (May 21, 1923), a majority of the court set aside the valuation made by the Public Service Commission of Missouri because no weight had been given to reproduction cost. Similar action was taken in the case of *Bluefield Water Works v. West Virginia* (June 11, 1923). In the Telephone case the court allowed a valuation equal to the total reproduction cost. In the West Virginia case it refrained from fixing any valuation, merely declaring original cost insufficient. In another case, decided June 11, 1923, *Georgia Railway and Power Company v. Railroad Commission of Georgia,* a majority of the court refused to reverse a decision of the Federal District Court which had allowed for the rise in the value of land, but had made no allowance for the increase in the cost of artificial materials.

The Original-cost Factor

THEREFORE, it is impossible to predict how much weight will be accorded in any particular case by the Supreme Court to reproduction cost as a determinant of fair value. All that we know is that the court will not permit this element to be ignored entirely.

From the viewpoint of exact and objective justice, original cost cannot be condemned as an adequate measure of value and method of valuation. Suppose that it were adopted by a city and inserted as a condition in every new public utility franchise. Suppose that the dividend rate were legally guaranteed and made sufficiently high to attract investors. The corporation and stockholders that would establish, say, a lighting concern subject to this condition, would regard the stipulated rate of interest upon such a valuation as a fair return on their investment. Otherwise, they would not accept the condition and the franchise. If the contract also included a clause empowering the city to purchase the utility for its original cost, the members of the corporation would have no reason to complain of injustice. Now if such an arrangement would be just when stipulated beforehand, would it not be equally just if enforced in the case of an already existing concern? If the original cost measure of value can be made sufficiently attractive to induce men to put their money into a new utility, why is it not fair to men whose money is already invested? The rule is equally just to the public, for the public ought not to reap gains at the expense of the investors.

There are only two possible objections to the proposal. In the first place, the investors in existing concerns were permitted to hope for an increase in the value of their property, at least in so far as it consists of land. They were not warned by public authority that the city or the nation would claim all increases in value, and would fix both rates and purchase price on the basis of original cost. A sufficient reply to this contention is suggested by the fact that for many years cities and states and the nation permitted investors in public utilities to cherish the hope that they would be able to reap all the rewards they could get, immune from any such troublesome restriction as rate regulations. Nevertheless, rate fixing became universal, and reduced both the profits and the capital value of many public utility corporations. And the courts upheld this restriction, this interference with profits and values, on the ground that these concerns were not private property in the ordinary sense, but were "affected with a public interest." Therefore, the investors were obliged to submit to restrictions which would not be legal in the case of other kinds of property. To introduce the further restriction of confining value to original cost would be merely to illustrate and extend the same legal principle.

The second objection has much more worth. It is that many public utilities have not received every year the rate of interest that would be necessary to induce men to invest in a new public utility subject to the rule of original cost. The objection can be fairly met only by conceding what the anthracite mine workers have called the "principle of net sacrifice." That is to say, the aggregate amount of money by which the total interest receipts of the public utility have fallen short of the total amount which it would have received on the basis of a fair and adequate rate of interest every year, should now be added to its valuation. At this valuation the property would be purchased. Through this arrangement the investors in existing utilities would obtain the same terms and advantages as the men who put money into new concerns subject to the original cost stipulation. It would seem to be quite as fair in the one case as in the other.

On the other hand, reproduction cost is sometimes unfair to the public and sometimes unfair to the in-

American Women Demand Scents of Orient

Heavy Perfumes of Far East Displace Lighter Odors Since the War

AMERICAN women today are demanding the heavy perfumes of the Far East. From the perfumes that sell for as high as $200 an ounce, and are applied with fine steel or silver needles, to the cheaper grades, the bulk of perfumes are the oriental brands.

Experts in these matters say the war changed the taste in perfumes. More than fifty per cent of the perfumes used in America before the World War were violet, but since the end of the war less than one per cent are of violet scent. Before the world was thrown into conflict the demand was for the light odors in perfumes, but in the last few years women no longer care for the light odors; they prefer the heavy, penetrating, lingering odors that the Orient has favored for many, many years.

This being the positive assertion of the men that head the perfume industry, the layman will conclude that the makers are put to great expense going to the Orient for their flowers, whereas, had women continued favoring violets, they could have continued to secure the material for perfume making in the nurseries of America.

The layman is mistaken. The oriental perfumes will come from the same place whence the violet perfumes came, not the nurseries of America but the laboratories of the perfume makers.

Flowers Contribute Little

FLOWERS contribute little to perfumes. The beasts that walk the earth, the fish that swim in the sea, the plants that grow in the earth and the earth itself provide the material for perfumes, but of all the flowers, natural and the inventions of botanists, that grow on the earth, only five can be utilized in the making of perfume; the others are useless except that some of them furnish odors that chemists can duplicate. Probably more violet perfume was sold in this country than any other kind and nothing in violet perfume comes from the violet itself; it is all artificial. Lilies of the valley, carrying one of the strongest odors known to flowers, never gave a drop toward making lilies of the valley perfume, and the same can be said of the carnation, for carnations, like violets and lilies of the valley, are a combination of the oils from other flowers and various chemicals.

These five flowers are all the chemist can call on in the flower kingdom to help in the making of perfume:

Certain kinds of roses.

Tuberose, a plant with a tuberous root that bears liliaceous flowers, beautiful and fragrant white blossoms.

Jasmine, called the shrubby jasmine and bearing white flowers of a peculiarly fragrant odor. The jasmine is common in the south of Europe and also in the Far East.

Jonquil, with its long rush-like leaves and yellow or white flowers of extreme fragrance. Sometimes it is called the rush-leaved daffodil. It is of the genus narcissus but its well-known relatives give nothing to the perfume makers while the jonquil does. The root of the jonquil has emetic properties.

Orange blossoms.

So there you have the rose, tuberose, jasmine, jonquil and orange blossoms as the only aid the perfume makers have found among flowers, and it is a strange thing that the best smelling roses are not of much use to the perfume-making laboratories, for the finest specimens of roses that one finds in California and Florida cannot be used.

The best roses for the making of perfume are grown in Lower France and Bulgaria. Nice, famous as a fashionable stopping place, is surrounded by a vast acreage devoted to rose growing for the making of perfume. Countless acres are covered with roses and just before it is time to cut them, trains passing through the rose-growing district must make the journey with every window closed tightly and protected to prevent the odor from stifling the passengers.

And So the Chemist Enters

IT REQUIRES 7,000 pounds of rose petals to produce one pound of essence of roses, and imagine how many truck loads of rose petals are necessary to produce three and one-half tons which, reduced to the desired condition, produce a single pound of essence.

Coming to one of the vast buildings where the roses are assembled to have the petals plucked, the stranger finds the odor beyond endurance. One must get accustomed to it before one is able to hang around and watch the girl workers, hip-high in roses, pluck the petals.

Only certain flowers will give oil that can be used. Some give none; others give oil but of no use in manufacturing perfume. Only the five mentioned give oil that can be utilized.

But woman demands perfume and so the chemist is set to work. Some perfumes he manufactures entirely in the laboratory. Where he can get aid from the flowers the task is less difficult. For instance, when he produces rose perfume he uses, besides the natural oil from the rose, sixteen other different kinds of oil including that of the geranium, which is a flower without striking odor.

When the chemist sits down to make violet perfume, the first thing he reaches for is a can of turpentine, for the chief ingredient of violet perfume is the aforementioned turpentine, plain, ordinary and never carrying what one would describe as a particularly agreeable odor.

But not everything that goes into perfume is as ordinary as turpentine. Some of the chemicals are rare. Also, the ingredients are not all chemicals, for to the perfume industry the civet cat, or little panther, the musk deer and the sperm whale have given great aid.

Certain botanical aid is necessary in the making of perfume. From East India is shipped vetiver, also called vetivert and vitivert, a grass with fragrant roots that you will hear called kuskus and khuskhus in the land of its nativity. From India comes sandalwood, which has many uses besides those to which it is applied in the laboratories of the perfume manufacturers. The Ylang Ylang of the Philippines is used, and so are flowers and plants native to China and Japan. There is scarcely a corner of the earth which does not contribute plants, fish or animals necessary to supply the world with perfumery.

Most important of all is musk. And, as desirable as perfume can be to the sense of smell, so undesirable is musk. It is not uncommon. Many animals are naturally endowed with musk. We have the musk cat and the muskrat, the musk beetle and the musk beaver, the musk deer and the musk duck, the musk parrakeet, the musk turtle and the musk ox among the creatures of the earth, and in the list of plants you can discover several that carry musk, among them the musk mallow, musk orchis, musk seed, musk pear and musk plant, musk root and musk rose, and others.

But the musk that is used in perfume making is a substance of a reddish brown color with the consistency of honey and endowed with a powerful and enduring odor. It comes from the musk deer, a small and hornless animal that inhabits the elevated parts of Central Asia. The upper canine teeth of the male are developed into sharp tusks, curved downward. It has scent bags on its belly and from these is derived the musk so necessary to perfume manufacturing. The deer is yellow or red-brown above, whitish below and a not altogether unattractive animal.

Without musk there would be no perfume, for musk is the substance that holds together all the other odors. The sixteen different fluids that are added to essence of rose to make rose perfume would be of no value if they were not mixed with musk, for the odor would soon pass.

Odors are fickle. Violets, no matter how strong they may smell, have lapses in which they emit no odor, and certain other flowers show the same absent-mindedness. Chemicals are guilty of similar lapses. Musk is what makes odors enduring.

The Victim of Musk

ONE of the world's leading perfume manufacturers established a laboratory in a remote part of Switzerland for the making of artificial musk. Just why the laboratory was located in a remote part of Switzerland will be understood presently.

The manufacturer sent several of his skilled chemists into isolation at this post in Switzerland. They made his artificial musk there. As time went on his chief chemist wanted to visit his people, quite a distance from where he performed his daily labor. The odor of musk had become familiar to him. He did not mind it. He walked miles to the nearest railroad station and tried to buy a ticket. He was politely ordered out of the station. He inquired the reason and received a ready answer.

He returned to a lonely cabin a mile or so from the "musk factory" and spent two weeks in a bath tub. He had destroyed every article of wearing apparel that he used during his stay at the factory. Finally he again ventured to the railway station. He was again asked to leave but not so quickly as before, so his spirits rose.

Returning into exile he ordered two more suits of clothes by messenger and they were desposited a few hundred yards from the house. Two more weeks were spent in bathing; another suit destroyed. Finally he ventured into the railway station again. This time he succeeded in getting second-class passage. He entered the train but was ejected at the first stop at the request of the other passengers.

Once more he went into exile. A few more weeks were consumed in trying to divorce himself from his relation to the musk-making industry. Finally came a day when he again succeeded in getting a second-class ticket. This time he did not find himself kicked off the train. Passengers would look curiously about them but none pointed an accusing finger at him. His hopes went high. He reached his destination. Not having eaten for several hours he entered a restaurant. Soon after he was seated curious glances were directed at him. Soon the manager arrived and came to his table. He politely requested the man to leave. The manager was sorry, extremely so, but business was business and what the guest's business was did not happen to be the manager's, and the manager's business suffered because of the guest's business. Nothing to do but to depart hungry.

He wandered the streets, self-conscious. He kept his eyes to the ground, fearing that everyone's gaze was turned on him. He thought of a leper and envied him, for the leper has his colony while the maker of artificial musk had none.

Hunger finally conquered him and he was compelled to make another effort. He chose a small restaurant in a remote part of the city. But one or two diners were there. He selected a table in a far corner. The head waiter looked about, sniffed and finally turned in his direction.

"Does monsieur intend eating here often?"

"Yes."

"Would monsieur object to this table on each visit?"

"No."

"Then we can undoubtedly arrange to serve monsieur."

So it was arranged. He stayed for two weeks, daily taking baths and massage treatments with prescribed chemicals, eating in the same remote spot thrice daily, always using the same table, the same service, the same chair. They were glad to give him complete exclusiveness; no one ever attempted or cared to intrude on his privacy. No monarch ever succeeded in so completely isolating himself.

He finally arrived in his home town. It was curious to see no one stare at him, no one run from him, no one edge from him. He felt free at last. He met his neighbors, his friends.

One of them sought him out the next day and made an unusual request:

"I wish that you would come with me this evening and meet my wife. Yes, I have been married since last I saw you, but it is not so much to make you acquainted with my wife that I am asking you to the house as to bear witness to the fact that I was with you last evening and not with a woman.

"My bride and I have had our first quarrel. Leaving you last evening at eleven o'clock I went directly to my home, arriving there probably twenty minutes later. I walked and it is necessary to walk rapidly to negotiate the distance in that time; one cannot tarry by the wayside.

Chasing the Civet Cat

"WHEN I reached our house my bride was waiting for me. She came up to kiss me and suddenly drew back. She became exceedingly angry. She accused me of having been in the company of another woman. I assured her that I had been with you, Henri, my old friend, all evening. She would have none of it. I reiterated my statement. 'Then tell me,' she cried, 'how did you come by that perfume?' I could not understand and I still do not. I tried to pat her cheeks. 'There!' she cried. 'There, it is even on your hands; you have been holding her hands all evening, her perfumed hands.' And you know, Henri, the only hand I touched all evening was yours, when I bid you welcome back, and when I bid you good-night."

The odor of musk is enduring, the most enduring in the world, and it is this quality that makes possible the perfumes of the world.

Musk is made artificially. Chemists have been able to reproduce almost every odor artificially. Different ingredients are used for different perfumes but musk is always one of the ingredients.

The *Viverra civetta* or civet cat is from two to three feet long and of a brownish-gray color with transverse black bands and spots on body and tail. It is found in Northern Africa and Asia. From glands in the civet cat is extracted a substance of the consistency of butter or honey, of a clear yellowish or brownish color and of a strong musky odor that is extremely offensive when undiluted but becomes unusually agreeable when a small portion of it is mixed with another substance.

This clear yellowish or brownish fluid is one of the most desirable ingredients for the making of perfume. It is eagerly bought and the natives seek the civet cat to extract the fluid. They pour it into hollowed horns and cover tightly with leather, then carry it for miles and dispose of it for big sums of money, sums that are big at least to the native. Chasing the civet cats is a lucrative occupation in those parts.

The Part the Whale Plays

THE sperm whale contributes its part to the making of perfumes. The sperm whale frequently grows to the length of eighty feet. There is a pygmy sperm whale that is rarely more than twenty feet in length and a sperm whale porpoise that measures about twenty-five feet in length as a rule.

An enormous head marks the sperm whale. Above the skull is a huge cavity and this is filled with oil. The sperm whale porpoise has an unusually large head also and it is very thick. Like the sperm whale it carries an oil reservoir above the eyebrows.

Now, ambergris is a substance of the consistency of wax that is found floating in the Indian Ocean and other parts of the tropics, and also as a morbid secretion in the intestines of the sperm whale, which is believed in all cases to be its true origin. The whale casts off this secretion and it is found floating in masses that sometimes weigh from sixty to two hundred twenty-five pounds. It is white, ash-gray, yellow, black and often variegated like marble, in color.

For some years perfumers were able to buy these masses from fishermen at low figures and it was profitable marketing along the various coasts until the fishermen discovered that what they sold for apparently huge prices and wondered what anyone wanted with it was one of the most highly desired ingredients in the manufacture of perfume. Rivalry in the perfume-making business had caused competitive bidding and the fishermen soon learned that the floating "wax" was well worth hunting for, so when the agents now scour the coast looking for new finds they pay high for the material that the high seas yield.

From these strange substances that are natural and from many times more that are artificial come the perfumes that the women of the world use, a strange concoction with its chief parts gathered from strange places and strange sources and only a small minority of them from the source everyone believes.

Veronese Masterpiece Found Under Daub

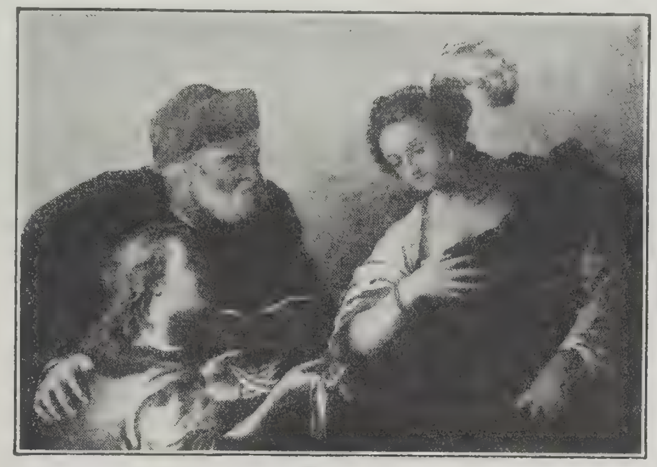
Mystery of Disappearance of Great Art Work From Italy Solved in America

By WILLIAM A. M'GARRY

A MYSTERY that has baffled art experts for a century and a quarter has been solved in Philadelphia by the discovery of the long-lost masterpiece, "The Marriage of Isaac," one of the greatest works of Paul Veronese. The painting disappeared from Italy during the Napoleonic invasions from 1796 to 1800, and, although France was searched, no trace of it could be found.

Now it appears that for at least a century, while the greatest connoisseurs of old masters in Europe were searching everywhere for it, the painting was being passed about openly from hand to hand in France. Covered with a thin coating of paint that blotted out three of the human heads and the head of a camel and the head of a horse that were part of the original composition; the exquisite coloring of the master buried under a coating of black paint, the masterpiece escaped detection until long after it was brought to this country.

It came here finally with a Frenchman who was the grandson of a soldier in the army of Napoleon Bonaparte. Three figures of the original composition were then showing, and apparently they constituted the whole picture. They were Rebecca, Isaac and the aged servitor. Various details of the original work had been blotted out with the colors and the extra figures.



Portrait as Dr. La Place got it at a public sale in New Orleans.

The name of the Frenchman who brought the painting to this city is lost now, but an effort is being made to find it so that the painting may be traced, if possible. At any rate the Frenchman settled in New Orleans and lived there for many years. A few years ago he found himself stricken with cancer. He was advised to submit to an operation, but he deferred it again and again until he learned that Dr. Ernest La Place, famous surgeon of Philadelphia and a Frenchman active in the affairs of his countrymen in the United States, was visiting New Orleans. Then the owner of the picture sought out Dr. La Place, in whom he had the utmost confidence. The operation was performed, but the patient was so far gone that Dr. La Place told him he could not recover.

In gratitude the man informed the surgeon that he had a painting which he believed to be of considerable value. "It will be put up for sale by my executors with the rest of my effects to pay my bills," he said. "I cannot afford to give it to you, but it is seemingly of little artistic worth, and if you are interested you can buy it at the public sale. Take it to a restorer and have him examine the paint. I have been informed that it is really a masterpiece, disguised to prevent its restoration to Italy."

More out of curiosity than in any belief that he would find anything of value, Dr. La Place took the description furnished by the man and attended the sale of his effects. When the painting was offered he got it "for a song." Art experts pronounced it an ordinary piece of work. Then Dr. La Place sent it to Professor Pasquale Farina.

"See what you make of this thing," said Dr. La Place. "It may be worth cleaning and it may not. I will leave it to you. Do as you like with it."

A few days later Dr. La Place was telephoned.

"There is a masterpiece beneath the daub you sent me," said the voice of Professor Farina.

"A masterpiece?" queried the surgeon. "By whom?"

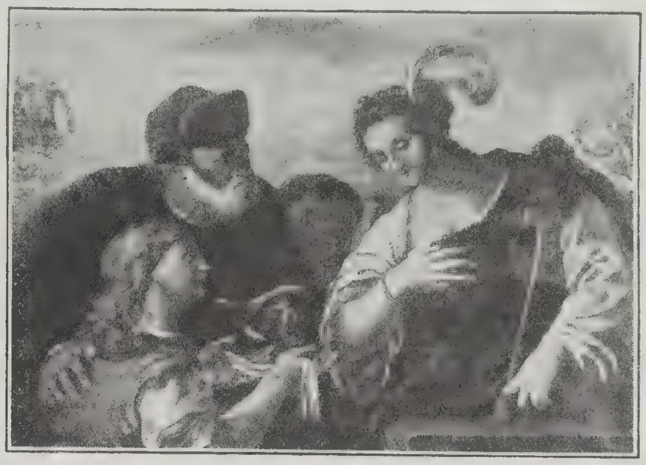
"That remains to be seen," came the answer. "It is of the Veronese school. I cannot say now that it is the work of Paul Veronese. There is much to be done on it. But come around and look."

The surgeon hastened around to the studio. His canvas stood on an easel, the north light falling on it. Here and there the dark paint had been cleared away. Beneath the black wrap thrown over the shoulders of the woman in the figure was showing an exquisite blue. But the most remarkable change was in the small space between the shoulders of the servant and the woman.

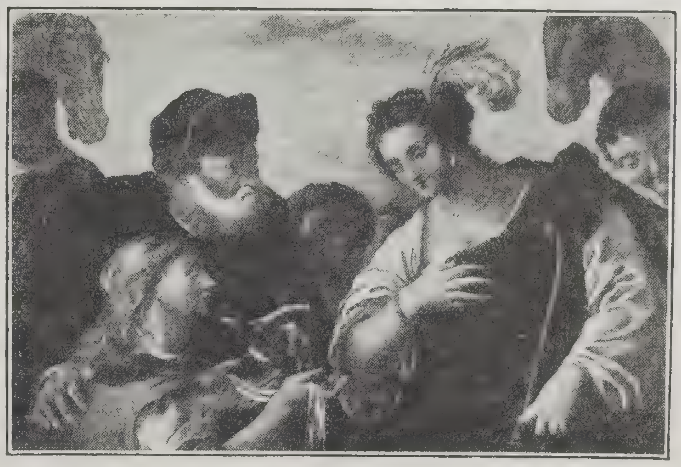
In that space, formerly part of the background of lackluster blue sky, was the pert and saucy face of a young Negro slave; the features being more along the line of the Moor than the Negro. The boy was looking up at the woman, a sparkle of interest in his eye.

Dr. La Place promptly authorized the restorer to continue the process of cleaning off the superimposed paint. Within the next week Professor Farina revealed beneath the blue background at the right-hand edge of the painting, just back of Rebecca, the face of a young page, with curly golden hair. At the left-hand edge he found another face, that of a young slave, blacker than the one in the center.

At first Professor Farina thought that had ended his discoveries. He believed that when he had revealed the true background, already indicated as a sky containing light, fleecy clouds with that effect of light and shadow of which Veronese was master, his work would be done. But just over the two figures last found he made out others. On the right, at the top corner, was the head of a camel. On the left, also at the top, was the head of a horse. Instantly he had uncovered the ears of the horse he became certain that the painting was a Veronese. In his studies of the works of that master he had noted the peculiarly conventional ears on his horses. These were identical.



After partial restoration. The head of the young slave in the center is visible; also the staff carried by Rebecca. It is now apparent that the girl's cloak contains color.



The complete restoration.

Among the details of the original composition brought to light by the cleaning were the staff carried by Rebecca and the earthenware jug. As the painting was covered Rebecca seemed to be standing at a sort of brick wall or balustrade. In reality that turned out to be the top of the well, and on top of that was the earthen jug.

Paul Veronese was the painting name of Paolo Cagliari, who was born in Verona in 1528 and died in 1588. He was celebrated as one of the greatest painters of his time, particularly of processional, ceremonial and festival pictures. In 1555 he was called to Venice to decorate the famous church of San Sebastiano, and there to this day is to be seen much of his best work on ceiling, walls, doors, organ and altar. He also decorated the library, which later became the Royal Palace, and the Ducal Palace, which was destroyed by fire in 1577.

"There is no question that the painting is the genuine lost 'Isaac and Rebecca,' painted by Paul Veronese," says Professor Farina. "Long before it was completely restored it was evident from a study of the first patches of original paint revealed that the basic work was done before the age of synthetic paints, which first came into use about 1840. This work is done in the elemental earth colors, produced by millions of years of chemical action in the earth. The colors cannot change. They are not dimmed by light or time. When the accumulations of dust and dirt are removed they are revealed in their pristine brilliance.

"That, however, did not suffice to convince me that the painting was the work of Paul Veronese. Neither did the signature which I found beneath the dirt and varnish superimposed during the years. It was not until I had examined, with the unaided eye and with the microscope, every square inch of the canvas that I felt certain beyond any possibility of doubt that Veronese and no other painted this picture.

"That fact is easily demonstrable to the artist. For the layman it may be said, without going into tiresome technical detail, that every great painter—every painter, in fact—has his own discoverable peculiarities just as every writer has a predilection for certain words and phrasings by which his work may be identified. There is a certain method in the brush work—in the application of the paint—peculiar to Veronese. When attempts are made to copy that method they are as easily discovered as the forgeries of signatures. Certain breaks and falters are found in the sweep of the forgery.

"Every stroke in the masterpiece is sure and firm. The paint is laid on with the assurance of the master. By analysis it is possible to pick out scores of strokes identical with brush strokes in other known works of Verones.

"Other factors also entered into my decision. Veronese was noted for the peculiar delicacy and lifelike quality of his flesh tints. Not only in the shadows, but when they were in the light, his flesh colors carried a charming suggestion of purple never achieved by any other artist. There are many other peculiarities of his coloring by which his work can be identified. Taking them all in combination, one who has studied the work of Veronese, the period in which he flourished and who has made physical, microscopical and psychological studies of his work must be convinced that this is a genuine Veronese."

The Fair Valuation of Public Utilities

Concluded from page 13

vestors. The public should not be required to purchase property at a price higher than its cost to the private owners. The latter should not be required to sell their property to the public below cost merely because the prices of materials have diminished since the utility was constructed.

So much for abstract justice. Original cost is confronted by two practical difficulties. The first is the fact that it cannot always be ascertained as a matter of historical record, and that in a few cases of very old concerns it cannot even be estimated. The brief presented to the Interstate Commerce Commission by Harleigh H. Hartman, July 5, 1923, gives several examples of this difficulty in relation to railroads. However, they are, on the whole, exceptional, and they have very little application to municipal public utilities. In practically all such cases it is possible to obtain the actual original cost or a substantially accurate estimate.

The other obstacle to the adoption of the original cost measure of valuation is the fact that the courts of the United States have apparently committed themselves to the rule that some consideration must be given to the cost of reproduction. In this situation the most that the advocates of original cost can expect is to get it accepted by the courts as the dominant measure. An equitable and expedient policy would be to concede to the utility either part or all increases in the value of land, while opposing any augmentation of value of account of the rise in price of the artificial elements. This policy can claim the sanction of at least one Supreme Court decision, namely, in the *Georgia Railway and Power Case.*

The adoption of original cost as the measure of public utility values, both for purchase and for rate-making, would have considerable influence in discouraging this perverted notion of private property. The investors in public utilities would be assured of a reasonable return on their capital, a return sufficient to induce them to invest. In case of sale to the public, they would be certain of getting back all the money that they put in. The profits that might arise from the efficient private operation of a public utility could go to those who created them, namely, to the workers and the management. No part of these profits should go to the stockholders as such, either in the form of increased dividends or enhanced capital value. This arrangement would stimulate and encourage labor, both physical and mental, and would leave no room for the exercise of the speculative spirit. It would not fatten the anti-social desire to get something for nothing. In a word, it would provide an immense stimulus to efficiency and make rewards dependent upon achievements.

Incidentally, the original cost rule would tend to diminish attacks upon the institution of private property. In a great majority of cases these are directed not at private property as such, nor even at profits as such, but at their abuses. Very few critics begrudge a reasonable rate of interest or a reasonable guaranty of property values. What they object to is exorbitant and unnecessarily high rates of interest at the expense of labor, and expansions of value which represent no labor on the part of the beneficiaries.

BRIEFLY TOLD

Tourists spent $45,500,000 in the state of Colorado during the 1923 season.

"I wonder what Grandfather Christopher would think of America today," said Christopher Columbus IX. "If he could cross the Atlantic on the great *Leviathan,* see Panama and other wonders of the American continent he certainly would be thrilled." Christopher IX is a direct descendant of the ninth generation, known as the Duke of Veragua.

The word "Adirondacks" is an Indian word meaning "wood-eaters," a derisive term given a defeated Indian tribe who were driven to the mountains by the victorious Iroquois and forced to live there on berries and bark.

Advertising on postage stamps has been permitted by the Italian Government. The advertisers agree to turn over sixty per cent of their receipts to the government.

Interest on its bonds is costing the state of Michigan $6.25 a minute.

Between 1914 and 1923 the number of Baptists in Russia has increased from 100,000 to 2,000,000, according to the president of the Baptist World Congress. The Soviet Government is pleased with the "democratic tendencies" of the Baptist Church.

A prisoner, serving a term in Atlanta prison for counterfeiting, was sentenced two additional years for counterfeiting money and passing it in prison.

Coal has been found in Ireland. At Coalisland two shafts a thousand feet deep have been sunk into ten seams of coal averaging three feet in thickness. It is estimated that 200,000,000 tons are there.

A yellow potato and new varieties of pineapple were brought from Central Peru recently by a botanist for the Field Museum of Natural History at Chicago.

Greenwich observatory, known and used by the scientific world, is to be moved from Greenwich to Holmbury Hill. Electrification of a railway line running near by necessitated the change. The observatory was built in 1675 for the advancement of navigation and nautical astronomy. "Greenwich time" is the world's standard.

Angelo Raggini, a clerk in the office of Mayor Hylan, of New York, was ambitious to become an opera star. He was supporting a mother and ten younger brothers and sisters out of his salary. His friends have taken stock in his future to the extent of $10,000, through the sale of 400 certificates, at $25 each. Trustees of the fund will forward to his school in Italy the necessary allotments of money as they are required.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

The flour mill owned by the state at Grand Forks, North Dakota, sustained an operating loss of $124,581 in the last eight months, according to audit published by the state industrial commission.

Modern methods of killing whales threaten extinction of the great sea-mammals in southern waters. They have nearly disappeared from the waters of the North.

Every six tons of waste paper produces the equivalent in pulp of an acre of virgin timber.

There are many wild horses on the island of Iceland. Formerly they were shipped to England for use in the mines, but that market is closing since mining machinery was adopted.

Members of the Ladies' Aid Society of Union Dale, Pennsylvania, painted their church.

By developing electric light to an intensity one-fourth that of the sun's rays, experimenters have been able to make flowers bloom at a pre-determined time, and to mature vegetables in from two to three weeks' less time than normally transpires between planting and ripening.

Teapot Dome naval oil reserve is so called because of a great rock shaped in the form of a teapot.

Of the 700,000 school teachers in the United States, 300,000 have never had regular public-school training above the seventh grade, says the president of the University of Minnesota. Salaries are too low to permit adequate training.

Last July trains coming over the mountains of Norway into Bergen and Christiania carried a foot of snow.

The new ballroom floor of the Savoy Hotel in London has just been relaid. Balkan oak, from a village near Sofia, after seasoning for ten years, was brought to England where it was baked for twelve days at a temperature of 100 degrees for perfect resiliency. Nine thousand two hundred pieces of treated oak were laid and for thirty-six hours men pressed it with electric irons. This Savoy floor is made to bear 250 tons of dancers.

One thousand young buffaloes will be taken from the Wainwright, Alberta, herd, and released in the region in which wood buffaloes are found. This is necessary because of the increasing size of the Wainwright herd.

The Barling Bomber at Wilbur Wright field recently rose to an indicated distance of 6,300 feet carrying a gross load of 33,570 pounds. It left the earth in fifteen seconds and remained aloft one hour and forty-five minutes.

New Jersey was once known as Nova Caesarea.

Two Senate committees hearing evidence on weighty public matters were disturbed and forced to remain idle when a gray squirrel became entangled in an electric fuse in the Capitol at Washington. Several miles of corridors and many inside rooms were thrown into complete darkness for more than half an hour.

In arrears with their rent 65,000 New York families were served with eviction notices during the first nine months of 1923.

A silver nugget, weighing 3,200 pounds and assaying seventy-five per cent pure ore, was found by a Cobalt miner while doing assessment work on his claim on the Montreal River. The nugget is worth about $20,000.

Decidedly the most succinct and true opinion that has been passed on Hendrik Van Loon's "Story of the Bible" is found in the *Survey Graphic* for November: "If the Bible had been no more than the story of the Bible it would hardly have survived long enough for Mr. Van Loon to deal with it . . . . Perhaps the pagan child will make the leap from Van Loon to Isaiah—but one doubts it . . . . Certainly one who first approached the story of the nativity through these casual paragraphs would fall on Luke's narrative with surprise and delight . . . . His drawings show Jesus with the halo, yet the text rationalizes or avoids the Miracles."

MEETING THE "FACT" SHORTAGE

That is what THE DEARBORN INDEPENDENT is doing. For nearly five years it has been telling the people plain facts about things which they did not know or understand. That's why it is called the "Chronicler of the Neglected Truth."

Beginning of the Goblin Order and Why It Flourished

CHRONICLER OF THE NEGLECTED TRUTH

Extravagance—That's What Shut Movies Down

Not Alone in Actual Salaries Paid, But in Statements, as Well, Says Authority

By JOSEPH JEFFERSON O'NEILL

Associated with Will H. Hays, the author of this article possesses first-hand information regarding the motion picture business. He here answers the Question, "What is the meaning of the present sudden shutdown in the movie business?"

"WHAT'S happened to the movie producers? Is the picture-making business in a slump? Has something gone wrong with the industry which has prided itself upon being the fifth greatest (or eighth greatest, or whatever it does pride itself upon) in the American financial field? What's all the fuss about?"

These questions and a lot of others like them were heard on all sides a short time ago when the Famous Players Lasky Corporation, biggest of all producers of photoplays, announced that their studios in Hollywood and Long Island City had been shut down and would remain closed for an indefinite period.

The note of apprehension which filled the atmosphere of the movie world was increased when it became rumored that other picture companies were planning to follow suit. Then the general situation was not helped any by the fact that F. P. L. stock hit the chutes down in Wall Street and skidded off 12½ points in a single day.

To the public at large, and even to a great many within the picture industry itself, this all seemed very puzzling and very alarming. Naturally it would. What was one to think when the most important of the producers stopped work? There was a feeling almost of panic in the air.

But the real fact of the matter is (or so at least it seems to me) that the film people have apparently learned a lesson that they were bound to learn in the end and should have learned long, long ago. And the lesson was this: That the worst fault which ever existed in or about the movies might be summed up in one word.

Extravagance!

Where Extravagance Lay

EXTRAVAGANCE in the making of "bigger and better" pictures—sometimes, possibly, called bigger and better chiefly because they cost more money than the earlier pictures.

Extravagance in the salaries paid to actors and actresses and directors and other work people in and about the studios.

Extravagance in the statements which were permitted to be sent out by the publicity getters for the pictures.

Now, these extravagances were leading in a dangerous direction. Naturally, the more it costs to make a photoplay the more must the producers of that play receive in the way of rentals from those who exhibit it in their theaters. And the more the exhibitors have to pay for the rental of a picture, the more must they charge in admission prices to you and me who go to see it.

The movies, we all know, are the people's own amusement. Far more so than books or magazines. Far more so than the so-called legitimate stage. Far more so even than baseball, which we have called our national sport. And the movies must remain exactly that—the people's own amusement.

In the beginning it cost only a nickel to see them. But also it cost only a few hundred dollars to make them. They were raw, crude things. But as they began to get better, they also began to be more expensive in the making. Admission prices went up, sometimes only a little bit at a time, but nevertheless they went up. The days of the nickel movie are long departed. So are the days of the sort of picture we used to see for a nickel.

A point has been reached, I think, where admission prices to the movies must go no higher than they are, if they are still to belong, as they do, to the people.

There was an unjustified rumor spread about a few months ago that motion pictures were to become "$2 shows." This is not true and must not become true. There are a number of really great motion pictures which are now being shown in theaters not originally intended for motion picture exhibition, and to these theaters the price of admission has been much higher than to the ordinary movie house. But eventually all those pictures will be shown in every movie house, even the cheapest in the world.

The Truth About F. P. L.

THE exact truth about the F. P. L. shutdown is this: Famous Players had completed, somewhat ahead of scheduled time, the twenty motion pictures which their program called for to be made this summer and autumn. They had on hand when they closed a sufficient number of photoplays to supply their demand for six months to come, even if they produced nothing further within that period.

Now these pictures had cost in production a vast sum of money, and production costs were shooting higher and higher. Further still, most of the money spent in making these films was still "out"; that is to say, it had not yet come back to the corporation in the shape of rentals paid by the exhibitors, which is the way producers get back their expenditures and their profits.

So somebody in F. P. L. (one might guess it to be Adolph Zukor, the president) made this businesslike suggestion:

"Look here; before we go any further in the making of these immense pictures, let's wait and see whether we are going to get back what we spent on them; whether we are going to make a profit on them, or whether we are going to lose money on them. Once we find out where we get off, we'll know how and when to proceed further."

Now there was nothing but plain common sense about that proposition. It is only what any manufacturing organization does in similar circumstances.

In the past, perhaps, the motion picture industry has not always been as businesslike as it might be. It is a queer, confused, complicated enterprise, and its problems are very much more intricate and numerous than any other I can think of offhand.

But it is settling down. It is finding a definite place in the business world. It is realizing that its continuance and prosperity demand the usage of the same rules and methods that banking, manufacturing or other large businesses have in vogue.

In addition to making this quite sensible suggestion, Adolph Zukor (or whoever it was) said something like the following:

"Now will be a fine time to get the motion picture business, as far as production costs go, on a common-sense basis. Too much money, it seems, is being spent for players. Their demands have grown altogether inordinate. And are these enormous scenic settings really necessary? Must hundreds of thousands of dollars be spent to show immense structures and great throngs—sometimes just brief flashes here and there in our pictures? Let's see if the public really is responsive to the sort of costly pictures we have been making, and shows its response at the box office. If the public actually demands that sort of thing, and pays for it, well and good. If there isn't an insistent demand for it, we'll make some other sort of pictures. But meanwhile we'll make nothing, at least until costs come down."

That's the real story behind the action of Famous Players, and I chance to know that the other big producers are thoroughly in accord with them. Right here I would like to interpolate a fact that possibly isn't generally known to the public. It is this: That the motion picture business is by no means the Golconda that the average person has been led to believe it to be. Some pictures, really good pictures, do make fortunes for those who produce them and those who exhibit them in the movie theaters. But many photoplays do not return by many thousands of dollars the money spent to bring them into existence. As in any other business, a worth-while product brings in a good return. But it is by no means the case that anyone can set out and make a picture and be sure of winning a great sum by it. Thanks to the foolish publicity sent out in days gone by from the offices of the producers themselves, the public has had quite another impression.

Production Costs Huge

BUT to return to the present situation. Everyone in motion picture production knows, of course, that the salaries of players and the expense of building enormous scenic accessories have grown bewilderingly and terrifyingly high within the past two or three years.

Douglas Fairbanks' production of "Robin Hood," I should say, set the pace which all the other picture makers tried to follow and even exceed. It was a good picture, a fine picture, but it cost a great amount of money. This was a case where the "sets," as we know them in the trade, ran into the hundreds of thousands of dollars, and where the cost of the players was not remarkably high. Doug probably has made, or will make, a profit on "Robin Hood."

William Randolph Hearst made his first expensive big picture at about this time—"When Knighthood Was in Flower"; interesting, beautiful to look at, and extremely costly. It is doubtful if Hearst will make much, if any, profit from it. In fact, Hearst has put into the motion pictures that he has already shown—exclusive of those he is now making—just about $4,000,000 more than he has taken out.

The Metro people followed suit with "The Prisoner of Zenda." Famous Players Lasky put a fortune into that epic of the West, "The Covered Wagon." This one is a financial as well as artistic success. But each producer got into the game of spending great sums to make pictures which should be larger in scope and more expensive than those of his competitors.

Having once established this higher standard in pictures, the producers found it was necessary for them to maintain that standard. There is no question about that. The only question is, should this new type of pictures cost as much as they have been costing within the past couple of years and especially within the past year?

But it seems to me that the salaries of some of the men and women who play in the big pictures are really more out of proportion than are the mechanical costs or the costs of the sets. And the producers have brought this situation upon themselves, I think, far more than they have brought upon themselves the expensiveness of the scenic accessories.

What is to blame? I was tempted to say the star system, but that would not be strictly accurate. The demands of the "near stars" or "featured players" are to blame, rather than the demands of the genuine stars.

For example, Tom Meighan is paid a salary that sounds enormous and really is enormous, but he is worth it. Other players, such as Harold Lloyd, let's say, or Gloria Swanson, or Lewis Stone, or Lillian Gish, attract hundreds of thousands of patrons to the theater which shows the pictures in which they appear, and thus they return manyfold the money paid them.

Here, I think, is where the difficulty lies:

Nearly all the producers operating on the West Coast, where ninety per cent of our pictures are made, have felt that they must have certain men and woman players of established reputation ("near stars"), who live out there, and therefore the producers outbid each other for the services of these actors and actresses—a little group which is limited in number, I should say, to less than fifty.

This running up of salaries by the producers themselves is economically wrong. Why, then, do they do it? Because they *think* the exhibitors (from whom comes the money in the shape of film rentals) insist upon having well-known names to exploit in connection with the showing of the pictures in their theaters.

To a certain extent, I dare say, this may be true. But if the exhibitors do think thus, and insist upon those names, they also are economically wrong, for they are forcing up prices against themselves. Why, then, do they insist upon such names? Because they *think* the public wants to see this same limited group of players in picture after picture—and *think* the public pays at the box office solely for the purpose of looking at these supposed favorites.

But is this true as regards the public? Personally (and as one of the movie fan public) I do not believe so. True, I will go to see a Tom Meighan picture in preference to many another, or a Lewis Stone, or Theodore Roberts, or Doug Fairbanks, or Lillian Gish or Norma Talmadge, for example. Why? Because they are stars? No. But because care is taken to fit *good stories* to these and other well-known players. In many cases the stories carried the films to "box-office success."

Fan Tired of Same Folk

MY OWN belief in the matter is that the motion picture fan, as a rule, is rather sick and tired of seeing the same faces upon visit after visit to the movie houses. I know I am. I think the public would rejoice, as I would, to see new men and women in the films. The employment of newcomers will probably result from the present partial stoppage of picture making.

Where will these newcomers come from? There should be no difficulty in finding them. There are many men and women in Hollywood today taking occasionally very small parts and sometimes appearing as humble extras who could readily be trained if they need further training, and who, at least in my opinion, would please the public. It would be easy to recruit others from the spoken stage—and the outsider would be amazed to know how many thousands of men and women have film-appearance as their goal in life.

There is no lack of specific cases in Hollywood which would prove the skyrocketing tendencies of the salaries demanded and received by certain players who are part of the little group to which I have referred. There is one actor, for example, who is equipped by nature with a face that automatically registers a sort of rough joviality. He plays villains or "heavies," as they are called in the jargon of the stage and screen. Three or four years ago he was only too glad to work for $250 or $300 a week. Then he chanced to attract great attention in one of the earlier of the massive productions I have named. Immediately there was a tremendous demand for his services and not only did he raise his salary to $1,200 and $1,500 a week, but demanded and secured also the right to work in the making of several pictures at once. While I was staying in Hollywood last spring this actor was driving daily from one studio to a second and then to a third, changing his costume and part at each place and was earning $4,500 a week. The producers thought they must have him because they felt that the exhibitors considered him a box-office attraction. And yet, this individual was never the real star or most important character in any of the pictures in which he appeared.

And She Got Her $800

THEN there was a girl who was only too delighted to get work at $150 a week—and she did not get any too much work at that. But while she was engaged in one production a competing company came after her and jumped her salary to $300. Another bid a little later on raised her to $400 and her next leap was to $800. She completed the picture in which she had been working at this figure and was temporarily idle, or "between pictures," as they call it in the trade. A certain producer wanted her for some brief shots in a film he was making. He asked her if she would not work for him for one day at the rate of $800 a week.

"Oh, no," said the young woman. "My salary is $800 and I will not make it any less, even if I work for you only one hour." So she got her $800.

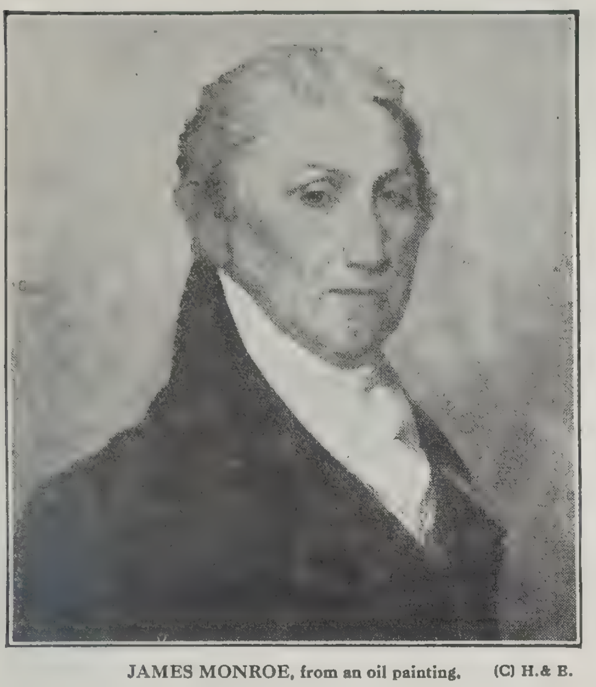
The movies, I think, are getting some sense. The present curtailing of production would seem to indicate that. One big organization has said, "We will not resume the making of any further new negatives until production costs have come down to a common-sense basis." Others of the big picture makers will most probably follow this example, and that, I venture to suggest, will be the best thing that could happen to the movies.

Production will be resumed within a few months, I believe, on a basis that will make for the increased permanent stability of the whole business.

Was It Monroe's Doctrine or Adams' Doctrine?

Last-named Enunciated American Principle and His Pressure Succeeded With President

By JOHN DAVIS ANDERSON



JAMES MONROE, from an oil painting. (C) H.& B.

A CENTURY ago, December 2, 1823, James Monroe, fifth President of the United States, presented his most noteworthy message to Congress. The instrument contained this pronouncement:

"In the wars of the European powers in matters relating to themselves we have never taken any part, nor does it comport with our policy so to do. It is only when our rights are invaded or seriously menaced that we resent injuries or make preparations for our defense. With the movements in this hemisphere we are of necessity more immediately concerned, and by causes which must be obvious to all enlightened and impartial observers. The political system of the allied powers is essentially different in this respect from that of America. We owe it, therefore, to candor, and to the amicable relations existing between the United States and these powers, to declare that we should consider any attempt on their part to extend their system to any portion of this hemisphere as dangerous to our peace and safety. With the existing colonies or dependencies of any European power we have not interfered and shall not interfere. But with the governments who have declared their independence and maintained it, and whose independence we have on great consideration and on just principles acknowledged, we could not view any interposition for the purpose of oppressing them or controlling in any other manner their destiny by any European power in any other light than as the manifestation of any unfriendly disposition towards the United States. It is impossible that the Allied powers should extend their political system to any portion of either continent without endangering our peace and happiness; nor can any one believe that our Southern Brethren, if left to themselves, would adopt it of their own accord. It is equally impossible, therefore, that we should behold such interposition in any form with indifference."

Herein we have in very substance the Monroe Doctrine—the thing which has meant so many different things to so many different persons at so many different times.

Washington had seen clearly and had announced forcefully sound principles in his Farewell Address.

"Europe has a set of primary interests, which to us have none, or a very remote relation.—Controversies, the causes of which are essentially foreign to our concerns.—Hence therefore it must be unwise in us to implicate ourselves by artificial ties in the ordinary vicissitudes of her politics or the ordinary combinations and collisions of her friendships or enmities, our detached and distant situation invites and enables us to pursue a different cause. * * * Why, by interweaving our destiny with that of any part of Europe, entangle our peace and prosperity in the toils of European ambition, rivalship, interest, humor or caprice?—"

We had set up on this continent a new form of government, so different indeed from that of Europe that it was being watched by all the crowned heads. Should it prove successful, its effect upon Old World forms was obvious, for there was stirring a deep hostility against the tyranny of the old.

It was perhaps natural that our earlier statesmen should view matters as did Washington. Indeed, nine years before Washington's Farewell, Thomas Jefferson, then in Paris, wrote to urge Monroe, just then engaged in the practice of law in Virginia, to add his "testimony to that of every thinking American, to satisfy our countrymen how much it is to their interest to preserve uninfected by contagion those peculiarities in their government and manners to which they are indebted for those blessings." John Adams in his second address to Congress (1798) called attention to what we may now call the American spirit. "A manly sense of national honor, dignity and independence has appeared, which, if encouraged and invigorated by every branch of the government, will enable us to view undismayed the enterprises of any foreign power and become the sure foundation of national prosperity and glory."

It was but five years later that the opportunity presented itself to make the Louisiana Purchase and into it Jefferson put his whole soul. Madison made this the subject of a message to the Senate in 1811 and that body two months later adopted his view by resolution. "The United States, under the peculiar circumstances of the existing crises, cannot, without a serious inquietude, see any part of the said territory pass into the hands of any other foreign powers."

East Florida was taken in much the same spirit but additional reasons swayed us. For many years the territory had been a refuge for the worst type of outlaws; had been the scene of more than one filibustering expedition and in the War of 1812 England had used it as a base.

Henderson says that the immediate causes leading to the enunciations of the Monroe Doctrine are to be found in a series of events beginning with the revolutionary movements in Spain's South and Central American colonies, all these difficulties culminating in the threat on the part of a European alliance of strong powers to intervene in behalf of Spain and in the interests of monarchical movement.

Napoleon and his armies had so weakened Spain by their military operations that the nation was in a condition of almost complete helplessness. Spain had never been a wise ruler and her colonies on the western continent turned squarely against her. Her chief antagonist in this general uprising was Simon Bolivar. Bolivar was born in 1783 and was educated in Spain. In 1809 he passed through the United States on his way homeward to Venezuela, and was so impressed with our institutions that he soon identified himself with the cause of independence. His leading of the first insurrection at Caracas was a brilliant stroke, but in July, 1811, Spain recovered her hold on the country. For the next nine years he led revolution after revolution and succeeded finally in liberating nearly all of South America.

In all this undertaking North American sympathy was strongly aroused. Neutrality had been proclaimed but material aid had been furnished by our citizens and there were frequent expressions of sympathy during that period by Congress. Jefferson, soon after these revolutionary movements began, had advised Governor Claiborne: "If they succeed we shall be well satisfied to see Cuba and Mexico remain in their present dependence, but very unwilling to see them in that of either France or England, politically or commercially. We consider that their interests and ours are the same, and that the objects of both must be to exclude all European influence from this hemisphere."

Monroe had been chosen President in 1816. He had received 183 electoral votes and Rufus King, his Federalist opponent, thirty-four.

We have alluded to a European Alliance as one of the causes—the chief cause—which brought about the declaration of principles contained in the Monroe Doctrine. This was not the Holy Alliance, as some historians have led us to suppose.

Shortly before the treaty at Paris in November, 1815, Alexander I., Czar of Russia, had put before Francis II., Emperor of Austria, and Frederick William III., of Prussia, for their signatures, that document known as the Holy Alliance.

Neither the Austrian nor the Prussian ruler had signed willingly and the alliance had been declared by Castlereagh "a piece of sublime mysticism and nonsense." Metternich described it as "a loud-sounding nothing." As an alliance little came from it, although some later authors have made bold claims and have even said that it was the forerunner of The Hague tribunal.

Austria, Russia, Prussia and England had allied themselves in common cause against Napoleon and had renewed this alliance after Waterloo. This Quadruple Alliance quite lost its original purposes a few years later. England withdrew from it while Spain and France had joined. The divine right of kings was a thing toward which most of Europe quickly returned after Napoleon's downfall. Spain, which had but a short time before demanded constitutional government, went back to her old form of absolutism.

With the Old World save England in this state, it was not long before word was heralded to our shores that the allied nations had for one of their aims the re-establishment of Spain in possession of all her American colonies—of undoing all of the noble work of liberation attained by Bolivar, the Washington of the Southern continent. To make the situation in America more difficult Russia was asserting claim to much of the territory on our northwest coast; had, indeed, planted a colony not far from the present site of San Francisco. Baron Tuyll was urgently pressing the claims of his country at a time when it was expected that the next news from Europe would be information that the new Russian-Prussian-Austrian-Spanish-French alliance was aiding Spain to regain what she had lost in the western world.

What took place in Washington between John Quincy Adams and the Russian baron is best told by Adams' diary under date of July 17, 1823:

"I told him especially that we should contest the right of Russia to any territorial establishment on this continent and that we should assume distinctly the principle that the American continents are no longer subjects for any new European colonial establishments."

Here we have reiterated the same expressions that Jefferson had made to Governor Claiborne fifteen years before. In the latter instance, however, it was not the sentiment of one American to another but what our Secretary of State had told the representative of the Czar. Adams was growing more bold.

Henry Clay had rapidly advanced to power in Congress—had become the leader of his party—and was exerting himself for the emancipation of South America. He lost patience with Monroe until the latter finally recognized the independence of the revolting colonies.

Matters were coming to move in the way that Clay had advocated but still not with sufficient speed to suit him. His chief joy was to know that with a single exception the states of South and Central America had chosen the republican form of government.

Great Britain was the only European country of any international importance then not bound by the terms of the alliance. Canning had protested with vigor against the proposed interference of Europe in America. On the other hand he was in no sense an admirer of the people of the United States, but he understood the American mind as well or better than any other statesman of his time. And our sentiments regarding the whole tangle were as he thought of such a character to be used to his own advantage.

JOHN QUINCY ADAMS, from an oil painting. (C) H. & E.

When the Ku Klux Klan First Flourished

Beginning of the Goblin Order; Its Change Into a Society of Regulators; Its Voluntary Dissolution Because of an Uncontrollable Membership

By MRS. L. M. CRAMER

ONE of the weirdest chapters in the history of this country has to do with the Ku Klux Klan. In less than a decade after its birth, the Congress of these United States had taken the Klan under investigation, but no group of men in the country, perhaps, was more baffled by it than was the Congressional Committee which investigated it. The men who founded it kept that fact a secret among themselves. They told no man of how it happened to come into being or of its purpose. Living, they kept their secret, and dying took it to the grave with them.

Today a reborn Ku Klux Klan is writing a chapter into twentieth century history. It is a Klan having nothing in common with the original Klan, as the original Klan was organized. Its operations have not been confined to the Southern states.

From old letters of a bygone day, and from clippings of newspapers of that time; from the pages of an old diary and from an article written nearly a half-century ago, I have gleaned some facts which in the light of present-day agitation over the Klan may make interesting reading.

The Ku Klux Klan's birth was the result of the peculiar social, civil and political conditions which prevailed in the South after the close of the Civil War, and of the unrest that follows war.

Pulaski, a little town of a few thousand souls in Southern Tennessee, was the birthplace of the Ku Klux Klan. Previous to the war it was a quiet academic town of considerable wealth, with two colleges within its corporate limits. War shattered its wealth, but it retained its culture. During the entire time of the Klan's first life and till dissipated by its official order, Pulaski continued to remain the seat of authority.

> "It is a sad commentary upon our laws if some must be broken in order that others may become effective. There is no such thing as enforcing law obedience by lawlessness. Lynching does not prevent crime. To break the law to enforce it is ridiculous."—*Professor Thomas H. Reed, of the Department of Political Science, University of Michigan.*

When, in the spring of 1865, the young Confederate soldiers of Pulaski returned from the battle front, they found themselves entering upon a period of enforced inactivity. The World War veteran passed through that same period of inactivity, the difference between the two being that the World War veteran returned to a country that had not been impoverished by war, and which had not been a battle ground for four long years. He returned to a country where amusements beckoned him on every hand. There were no amusements in Pulaski, and the Confederate soldier, a mere boy oftentimes, was a veteran of a lost cause. In many respects this period tried their souls more than had the ordeal of war that lay behind them. The reaction that followed their years of service was intense. They could not go back to their active business or professional pursuits. They felt too old to go to school again. Their business habits were broken up after four years in the field, and few had sufficient capital with which to undertake agriculture. Their restlessness was enhanced by the fact that they had no amusements or social diversions.

One evening in June, 1866, a few young men of Pulaski, all veterans of the Civil War, met together to organize a club or society to help to pass the time. Eight or ten men were the founders of the club; a chairman and a secretary were elected. Then the question came up: "What shall we call ourselves?"

First of all they must have a name and a ritual for the initiation of new members. There was a great to-do over the name. Every member had some suggestion to make, and then some one proposed the name "Kukloi," from the Greek word "Kuklos" meaning a band or circle, and some one else, all enthusiasm, called out, "Call it Ku Klux" and in the same breath another shouted the one word "Klan," and thus the organization was named.

The psychologist will tell you that had these young men been content to call themselves "The Jolly Rovers" or "The Happy Ten" the organization would have remained merely a club for pleasure, lasted its short time and been forgotten. But the name Ku Klux Klan was mystifying to all from its very inception, and terrifying to some who heard it.

Given the name, the members all vowed that the club must measure up. Obviously it was not the name for a dancing club or for a dramatic organization, though later on it developed that there was much that was dramatic to enter into it. Officers, too, must fit the title. Surely no such name as president, vice-president or secretary would do, so they sought original titles to name the Klan's officers.

Secret From Beginning

THE names "Grand Cyclops" and "Grand Magi" were chosen, corresponding to the usual president and vice-president. Also was named a "Grand Turk"—otherwise a marshall—a "Grand Exchequer" which, of course, was the treasurer, and two "Lictors" or guards to see that none other than Klan members attended the meetings which were to be held in the "dens," as their meeting places were called.

Absolute and profound secrecy both as to the obligations of the Klan and as to the names of its members was enacted of all who were the Klan. Each member provided himself with a white mask for the face, with orifices cut for the eyes and nose, and a tall fantastic cardboard hat so constructed as to increase the wearer's apparent height. His robe, of white or black and sometimes of the fantastic cloth and coloring known as Dolly Varden, covered the wearer from his neck to his toes. Each member carried a small shrill whistle, and while no person spoke aloud at these meetings, by certain signal whistles between the members it was quite possible to carry on a conversation. Of course the business of the whistle was simply to enhance the curiosity of outsiders. In the black of night, given the proper fantastic surroundings, who shall deny that whistles, short and sharp or prolonged and wailing, answered by other mysterious whistles did not add to the mysterious and occult effect they desired to produce. The dens were always located in some isolated place, near or in woods.

The Mystery That Attracted

PEOPLE, always attracted by the mysterious, wanted to become Ku Kluxers. The Klan, please remember, was at this time composed of men of sterling character and habits. Occasionally if a man undesirable in these particulars applied for membership, he was given something not at all in the ritual, and generally took the hint, but kept his mouth shut afterward.

On the brow of the ridge running along the western outskirts of Pulaski, in a dilapidated old house, long deserted, the Pulaski klan held its meetings. This was the first "den." The initiations resembled, in part, fraternity initiations of today. The candidate was asked many questions, some grave and serious, most of them absurd to the last degree. This was after he had been led blindfold for many minutes about the rooms in the den, had barked his shins on obstacles purposely placed in his way, and many times after he had sprawled his length upon the uncarpeted floors. If his answers to the questions of his tormentors were satisfactory, the obligation to secrecy, which had already been administered in the beginning of the ceremony, was now exacted a second time. Then the Grand Cyclops commanded: "Place him before the royal altar, and adorn his head with the royal crown."

The "royal altar" was a large looking glass. The "royal crown" was a huge hat bedecked with two enormous donkey ears. In this headgear the candidate was placed before the mirror, and directed to repeat the couplet:

"O wad some power the giftie gie us
To see oursel's as ithers see us."

As the last words fell from his lips the Grand Turk removed the bandages, and the candidate beheld his own image in the mirror. To increase the discomfort and chagrin, the removal of the bandage was the signal to the Klan for indulgence in the most uproarious and boisterous mirth. The Grand Cyclops would relax the rigor of his rule, and the decorum hitherto maintained would disappear, while the den rang with shouts and peals of laughter. And worse than all, as the candidate looked about him he found himself surrounded by men dressed in hideous garbs and masked so that he could not recognize one of them.

No one was more surprised than the original Klan members when they learned that the fame of the organization had outgrown the narrow limits of Pulaski and that other near-by villages wanted to establish chapters. Eventually it extended to many parts of the South. During the autumn and winter of 1866 the growth of the Klan was very rapid. It spread over a wide extent of territory. A stranger visiting in the town would be initiated and immediately ask permission to establish a den in his own community. Usually this request was granted. The connecting lines between these dens was very fragile. Always the Grand Cyclops of the Pulaski den was virtually the ruler of the order but as the means of communication were so slender his authority was usually more fancy than fact.

After ten months of existence, leading spirits of the Klan still contemplated nothing more serious than amusement. They enjoyed the baffled curiosity and wild speculations of a mystified public even more than the rude sport afforded by the ridiculous initiation. Yet all this time features were gradually being initiated into the order that were slowly transforming it into a band of "Regulators."

One man, writing a few years later, and with seeming knowledge of the Klan which few had, declared: "This transformation was due to three causes and their combined operation: the impression made by the order upon the minds of those who united with it; the impression produced on the public by its weird and mysterious ways and the anomalous and peculiar condition of affairs in the South at this time. People generally who were not its members grew to look upon the Klan as an organization contemplating a great mission, and even when admitted to membership the impression was deepened rather than dispelled by what they saw and heard. Each Klan seemed to have its own opinion as to the character of the serious work the order had to do. It was an unhealthy and dangerous state of mind, with bad results naturally following it."

When the Klan first began to hold its meetings in the dilapidated house on the hillside just out of Pulaski, passers-by were frequent. Most of them passed the grim and ghostly sentinel on the roadside in silence, but always with a quickened step. Occasionally one, a more venturesome spirit, would stop to ask: "Who are you?" Invariably the reply, given in sepulchral tones, was: "A spirit from the other world. I was killed at Chickamaugua." Such an answer, especially when given to a superstitious Negro, was terrifying and with the noises issuing from the den at times of initiation was the foundation for awe-inspiring stories. The stories were told broadcast. The belated laborer told of strange sounds he had heard, and the sights and the weird noises grew with his imagination and the number of times he told the story. The result was that the feeling among the Negroes and the poor whites was one of awe and terror. People began to avoid the vicinity of the dens. In this way the Klan gradually came to realize that one of the most powerful devices ever constructed for controlling the ignorant and superstitious was in its hands. Even the highly cultured were not wholly able to resist the peculiar and weird feeling which pervaded the whole South. It was the power of the unknown over the minds of all classes. (This has been very hectically described in Thomas Dixon's once widely read novel, "The Clansman.")

Circumstances made it evident that the measures and methods employed for sport might be effectively used to subserve the public welfare, might be used to suppress lawlessness and protect property. There were many of the Klan who hesitated, fearing danger, but the majority regarded such fears as groundless, and the majority rules. The very force of circumstances carried the Klan away from its original purpose and in the early part of the year 1867 it had become virtually, though not professedly, a band of regulators, honestly, but in an injudicious and dangerous way, trying to protect property and preserve peace and order.

At that time the South was gradually settling down to peace after the bitter war struggle. The better class of the Southern people took their defeat as true sportsmen, determined to accept the arbitrament the sword had accorded them. They went back to their farms, their shops, their stores and their offices. But there were two causes of vexation and exasperation which the people of the South were in no mood to bear. One of these causes was the newly freed Negro who did not know how to use his new-found freedom (no blame to him); another cause was the administration of civil law by "carpetbaggers" of all degrees of undesirability, in consequence of which there was an amount of disorder and violence prevailing over the country which has never been equaled at any period of its history. The depredations on property by theft and the wanton destruction of it for the gratification of petty revenge were to the last degree annoying and terrifying. A large part of these depredations has been laid to white men, carpetbaggers and poor whites, who expected their lawlessness would all be laid to the Negroes.

Many of these ignorant whites had, like scum, been thrown to the top in the great upheaval of war. Most of them had played traitor to both sides, and on that account were despised. Had they been Union men from conviction, that would have been forgiven them. At the time of the birth of the Klan their main object seemed to be to keep alive discord and strife between the sections as the only means of preventing themselves from sinking back into the obscurity from which they had come.

Proclamation Ends Order

THERE was a third element which was potent cause for this transformation from a social club—object fun—to a body of serious-minded regulators, in the spurious and perverted form of an organization known as the Union League. This league was in no manner related to the Union League, an organization of the North, but it took its name without asking permission or receiving consent. This league in the South was composed of the disorderly element of the Negro population, led by white men of the basest and meanest type. The league met frequently, always armed. It issued the most violent threats against persons, families and property of men whose sole crime had been that they fought under Lee and his generals. In not a few of these instances the threats were carried into execution. It was partly to resist this organization that the Ku Klux Klan was transformed into a protective organization. No one who was familiar with the South in the reconstruction period has ever doubted the value of the work done by the Ku Klux Klan in the South in those days. It was of immense service, but there were

Mode of the Marionettes Has Gone Thro' Ages

Strange Little Dolls "With Souls" Stir Interest as Result of Sarg Tour

By HENRIETTE BOECKMANN

Mrs. Clara Vostrovsky Winlow (right) and her young daughter, Anna, who have participated in the manufacture of a host of the most enchanting Russian puppets with which to present fairy and folk tales of that Asiatic country.

> *"I believe in the immortal soul of marionettes and dolls. There is something in them of the divine, however little it may be. They do not live like ourselves, and yet they do live. They live as do the immortal gods."*—Anatole France.

INTEREST aroused in marionettes has received notable impetus through the indulgence of newspapers in allowing unlimited space to the accounts of the disentombing of that Egyptian ruler of the eighteenth dynasty, King Tutankhamen, since marionettes were freely used in religious rites and otherwise in those days, some 3,500 years ago. Certain it is that Tony Sarg with his coast-to-coast marionette tours has sent forward the interest in these strange little dolls by many a long league.

There is nothing so very odd in the sustaining diversion adults find in a marionette show. History tells us that the puppet-player, Potheninos, was so much in demand in ancient Athens that the Archons relinquished to him the very stage on which the dramas of Euripides had aroused the mighty applause of the populace. In the time of Shakespeare in England, of Molière in France, and of Goethe in Germany, history records the development of such an amazing popularity for puppet performances as to become a formidable rival to theatrical companies. And bringing matters down to date, what an overwhelming admission to the power of a puppet do we find in the following extract from an article written by one of the leading dramatic critics of today, "Some of the leaders of the theater boast that ultimately they will do away with actors in favor of super-marionettes"!

Mrs. Melchezedick in the Municipal Players group of marionettes expresses her opinion before Jack of the beanstalk fame, as he is about to ride off to town on the cow

Many spectators at a marionette performance, even of the most perspicacious intellect, soon lose all sense of the puppets as puppets and look upon them as living beings. Gordon Craig, the originator of the modern movement of art in the theater, has said that there is one way in which to assist the world to become young again, that is to allow the young mind to learn nearly all things through marionettes. Whereas all students of the fairy tale give that wonderland, India, as their home, no single puppet play has been handed down to us from antiquity although it is certain that puppet shows antedated drama. As the fairy tale wandered from India into Persia and thence to Arabia, whose countrymen brought it to Europe, so does the eminent Professor Richard Pischel contend that wandering bands of gypsies brought the puppet play to Europe in ancient times. Yorick, however, as well as many other authorities, claims that marionettes originated somehow with the aborigines of the Nile instead of on the banks of the Ganges, and that before the Pharaohs, great idols moved their hands and opened their mouths inspiring worshipful terror in the hearts of the beholders. True it is that in certain museums one may see many small painted puppets of ivory and wood whose limbs can be moved by pulling strings, and excavations at a tomb in Antinoe revealed the oldest marionette theater known. It was constructed in the cabin of a little wooden Nile galley or barge with a pair of ivory doors opening to reveal a stage crossed by a rod supported with two uprights, and from this rod light wires were found still hanging. All excavations on this site belong to the Roman or Coptic period, and the little theater was undoubtedly used in a religious rite.

Belinda, at the left, first-born of the Municipal Player puppets, is the pet of the entire company. Next comes the giantess of the mournful expression, busy at her washtub, while the fairy-godmother who is the "flapper" among this group of puppets, posed for the photographer at the right.

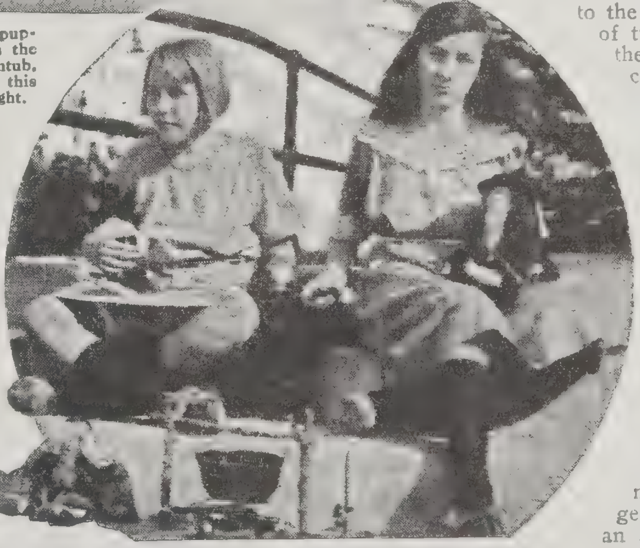
But wherever it was that the first puppets performed their part, either in the vast temples of Egypt or in those of India, their footsteps can be followed down through the classic centuries of Greece and Rome, on through the dark ages of early Christianity whence they emerged to wander all over Medieval Europe, in the cathedrals, along highways, in the market places, and at the courts of kings, patronized alike by princes and the populace.

Not only because they were used within ecclesiastical circles but because the word marionette is a modification of Maria, the Virgin, meaning little Maries from the early statuettes in the churches, do some attach a certain sacred significance to puppets as things which aspire to be idols, and not the imitations of actors.

Puppet in Sanskrit is "putrika," meaning "little daughter," these same "little daughters" being made of wool, wood, buffalo-horn, and ivory in India. But in various climes at various times marionettes have been constructed of other materials as well.

Few have been the marionettists operating in the United States. Until Tony Sarg came along with his "string pullers" a year ago in all of Southern California there was never, to the writer's knowledge, even the slightest simulation to a marionette show. But now the West is showing an almost overweening interest in marionettes. In Los Angeles high schools, for example, classes in the manufacture and manipulation of marionettes have been introduced to satisfy the persistent demand for such knowledge. Younger children as well as the most erudite adults have snatched at this fascinating outlet for their dramatic and artistic talent.

It is always interesting to watch an audence at a puppet show. It is so evident with what grip it holds everyone and how readily it induces a vivid imagination. It is the endeavor among many puppeteers, especially those who wish to appeal to children, to produce an artistic interpretation of the old fairy tales which will be instrumental in developing the imagination and cultivating an understanding of the symbolic meaning of things. This is indeed an age of symbolism. The plays of Maeterlinck, for example, which were meant to be performed by marionettes, are the very essence of symbolism.



These two children, aged eleven and twelve, have made a large number of marionettes without aid, and given several puppet shows purely for the fun they find in it. It is a liberal education all the way from costuming to carpentering.

For a moment let us lay aside the certitude that many of the greatest *litterateurs* and artists of all times have shown keen interest in puppets, and turn to a living example of two children who with all the simple *naivetè* of their years, have developed a puppet show at home. They are two little girls living on the tiptop of a mountain in Los Angeles, one aged twelve, the other but eleven. It has been often observed with what beautiful earnestness children take their play, but never was this more apparent than with these two marionette-making lassies. So engrossed were they in their puppets that even to have their pictures taken was a minor matter, nothing short of a nuisance, in fact!

As was the experience of other children fortunate enough to have been in the path of Showman Sarg's puppet tours, these two juvenile proprietors of a puppet show gained their inspiration from witnessing one of those puppet spectacles gathered together in Gotham. How a great scenic painter would have envied the daring simplicity of the performance these two children gave of Pavlowa's "Snowflake Dance"! Butcher's skewers were used for the slender legs of these adept dancers with cloth-and-cotton heads, and their costumes consisted of circle after circle of lace-paper doilies which dropped off at intervals during the dance; with a flour-sifter working overtime overhead, the result was an effect altogether as satisfactory to those of tender years as the most costly production undertaken by the Russian *danseuse*.

These children very cleverly combined pieces of their surnames and evolved a title for their show and were so encouraged by their first "success" that they went ahead and fashioned the necessary marionettes of rags and cotton and "just any old thing," as one of the twain put it, for a dramatization of the old folk tale, "The Three Wishes," which they put on several times at home as well as at a large children's party at one of California's leading caravansaries.

It was at this juncture in the affairs of the Mysel Marionettes that the paters familias of the "proprietors" lent a hand and built their daughters a modern little stage with proper lighting equipment. One child paints the scenery, the other constructs the furniture, which for the most part is of an exceedingly fragile type, pasteboard being the material! Ordinary black linen thread is used for stringing these dolls to the body controller made of two pieces of wood in the shape of a Roman cross, which these children handle very adroitly. Hooks sewed onto the hands of these little puppet people, averaging only a foot in height, serve excellently for fingers.

By drawing in the entire family as is the case of the Mysel Marionettes, the domesticating of this ancient art is assured But it is not only in family circles that marionettes and their gesticulations have found an admiring audience Among groups of young men and women the manner of a marionette has "cut a wide swath" in popularity. A score of young college-bred persons banded together in Los Angeles for the purpose of producing plays in a municipal theater. They have created a coterie of puppets for giving performances not only to the school children at the various playground centers in the city, but to adults in the poorer quarters where many a work-weary foreigner will joyfully witness the first puppet show he has seen since leaving his fatherland.

Old silk undershirts were found by these municipal players of Los Angeles to be the most satisfactory cloth for the modeling of marionettes. Various members of the group "specialized" in the business of building up the dolls' anatomy, one making the legs, another the arms, and so on, the directress herself making the most important part, the head, and using sealing wax for eyes and mouth with excellent results. The placing of weights and the settling of such weird-sounding problems as where to leave vacuum spaces in a puppet are important points, for on these things depend the flexi

Are the Records of America Worth Saving?

Destruction of History-filled Documents Invited by Lack of Archives Building

By CARSON C. HATHAWAY

This article is based on first-hand knowledge of conditions in the Washington departments, supplemented by information obtained from the files of the Department of Historical Research of the Carnegie Institution of Washington.

ONE current problem which America faces is the impending destruction of her historic records. Every so often a fire breaks out in a government department in Washington, D. C. At times the losses are heavy.

There have been several fires recently, but the most destructive blaze in the last few years occurred on January 10, 1921, when someone tossed aside a cigaret in the basement of the Commerce Department. In a few minutes dense clouds of smoke were pouring from the windows. When the fire engines departed they left behind a great ugly mass of burned and water-soaked papers.

Officials estimated that it would take from two to three years and cost two million dollars to copy off and save the invaluable census records that had been damaged. Many were totally destroyed.

Next day the newspapers said, "The need of a permanent archives building for government records was never better emphasized." They had been making similar statements for the past fifty years.

At Washington are the majority of the records which show American history in the making. In the State Department are found the original laws passed by the first sessions of Congress, all the original treaties made between this country and other powers, all the declarations of war and the treaties of peace.

In the War Department are the headquarters records and papers of the American Expeditionary Forces during the World War as well as the personal service records of the individual soldiers. These papers are of tremendous historic interest. Many of them will be used as evidence when claims are presented against the government.

The Treasury Department has part of its records stored in the attic. Others are in a basement adjoining a fountain, while a third group of records were brought to light not long since in the basement of an old theater which was condemned as unsafe.

Such conditions are not the fault of any department. It should be remembered that most of the buildings were erected years ago and that the departments have outgrown them. Records that are not absolutely current must be stored away in the attics and basements. Unfortunately, the terrific heat of the Washington summers renders the attics veritable fire traps while in some of the basements records have been found submerged in water or covered with mold.

An original letter from George Washington, written shortly after the surrender of Cornwallis, was recently discovered in a pile of old archives of the House of Representatives. Not long before, correspondence of Andrew Jackson was brought to light by a Cabinet officer among his official files. The papers were transferred to the Library of Congress. There is room in that building, however, for only a very small portion of the records which may in time be considered invaluable.

Most of the valuable papers are originally compiled in connection with the regular work of a department. There they remain for many years. There is no hard and fast line between "current" and "obsolete" records but when someone in authority decides that certain material is serving no immediate need, it must be stored. It usually goes to some place where it will not be in the way. In many instances it is necessary to rent storage buildings. It is said that space occupied by records in rented buildings costs the government more than $100,000 a year.

The buildings are often far from fireproof, although the government losses through fires might well serve as a warning against the use of such structures. Senator Fess, of Ohio, once declared that there had been 250 fires in government buildings in Washington since 1873, with losses beyond estimate. Going back further, it may be noted that in 1800 the records of the War Department were almost entirely destroyed. In 1833, a fire destroyed nearly all the correspondence files of the Secretary of the Treasury. In 1836 valuable Post Office records and nearly all the records and models in the Patent Office were destroyed. In 1877, another Patent Office fire destroyed 87,000 models. The main Treasury Building caught fire twice within a few days during a recent period of repairing.

The records thus exposed to danger by fire and water are on almost every conceivable subject. There are several tons of archives of the Confederate government. There are the draft records of the World War. There are records which must be used in claims against the United States. Titles to lands are involved. There are papers on patent rights. In the Civil Service Commission are the service records of several hundred thousand government employes.

An investigator searching for information was directed to a storeroom in the basement of the National Capitol. This is his statement:

"Under the terrace on the north side of the Capitol below the Senate Chamber is a large collection of bound manuscripts. A portion of these volumes contain bills illustrating various stages of progress of United States statutory legislation. As evidence of what the Senate has accomplished since 1789 they must be reckoned among the most precious possessions of the government. This mass of material is at present lodged on wooden shelves or on the concrete floor of three dark rooms usually overheated by steam pipes and unprotected from dust and rats. The manuscript volumes along the floor, together with many others above them, are rapidly disintegrating and falling to pieces."

After a fire in the Department of Commerce, Washington, D. C. (C) National Photo.

When ex-Senator Beveridge was preparing his "Life of John Marshall," he sent word to a Washington man to look up certain documents in a department. It took a week to locate them although if they had been properly classified in a central building provided for the purpose they could have been obtained in fifteen minutes. On another occasion, Treasury Department officials stated that a certain old volume was not in the department, only to have it discovered that there were on hand two hundred volumes like the one desired. Such conditions are inevitable as long as the records are scattered about in a hundred isolated places.

One individual who has made a very careful study of the situation has summed up the matter as follows:

"When, as in the Treasury and the State, War and Navy buildings, there are papers stored in the attics, they become under the influence of the summer heat as dry as tinder and it would take but little to start a fire that would consume entirely the records of certain bureaus before it could be controlled. On the other hand, there are various bodies of archives that are kept in close proximity to furnaces and boilers and are thus exposed to constant risk. But the danger from fire is not all. Thousands of volumes of paper have been found stored in places so damp that the water oozing from walls and ceilings dropped upon them and these books were so covered with mold that the titles could not be read. The pages of such volumes were damp and stuck together. Great masses of important materials in the Land Office have had to be stored where they received the drippings from steam pipes or where they collected thick coatings of dirt. Papers stored in attics often become so dry and scorched that the paper crumbles at the touch, while those in the cellars frequently mold and rot into pulp. In most of the departmental buildings a great deal of material has to be stored in the corridors or anywhere where there is a cubic foot of space. Papers have to be stacked up in bundles like cordwood or even thrown down into huge piles. Some ten tons of Confederate archives, as well as the original census schedules, were once condemned as useless but were fortunately saved."

The records in the departments are not the only ones facing destruction. There are other invaluable records scattered in our embassies and consulates in all corners of the globe. It is regrettable but true that most of the representatives of the United States live in rented quarters. They must move about frequently. Papers are then subject to loss. Sometimes retiring officials see fit to take certain records with them, perhaps to serve as data for autobiographies. When the United States itself decides to write its autobiography, valuable evidence will not be at hand.

The material left in foreign countries by our representatives has been allowed to accumulate there instead of being brought to the State Department in Washington. Some time ago, when an inventory of the records, in all of our foreign offices was ordered, many historic documents were brought to light. In Denmark were found the records of claims by the United States Government against the Danish Government in behalf of John Paul Jones. In Costa Rica were reports concerning Americans alleged to have been engaged in inciting revolutions. In Colombia were the records of the beginning of negotiations resulting in the treaty of 1869 for the construction of a ship canal across the Isthmus of Darien (Panama). From other offices came reports on the history of treaties, the recognition of revolutionary governments and the suppression of the slave trade.

As historical documents, these records are invaluable. As matters of current importance, they are of little value. Many of those making reports state that they are never used or that they are consulted very rarely. They should be brought to Washington and placed in an archives building. There is none. They would have to be placed in some out-of-the-way place, already crowded to overflowing, so they are left where they are.

Their present surroundings are not altogether satisfactory. In Singapore, they have been attacked by cockroaches, in Siam by white ants, in Peru by a destructive worm called the pollila, while the office in Tahiti was invaded both by worms and a tidal wave. Other offices complain that their records are being attacked by bugs, vermin, mice and rot, not to mention occasional fires which have taken further toll.

Scattered through the West are old Indian agencies whose records cover one of the most picturesque epochs in American history. There is no other place available for them except where they are, but the comment of one agent on his headquarters is illuminating:

"The building is unsafe. It has caught fire occasionally but the fires have been extinguished without total loss. There are letters on file as early as 1860 relating to the history and administration of the agency. They have been badly damaged by vermin and by children of former agents using the documents as material from which to cut paper dolls."

The recommendation, introduced in 1878, that a Hall of Records be provided, has been presented to practically every session of Congress since that date. Plans for an archives building have been made and approved, but Congress has failed to appropriate the money to build the structure. It is estimated that it would cost from one to three million dollars.

The American Historical Association has drawn up an attractive plan for the administration of the proposed building. This provides that the Librarian of Congress should be the nominal head of the institution. Under his supervision would be an official known as "The Archivist of the United States" who would have actual charge of the building. To determine matters of policy there would be an "Archive Council" composed of a representative from each department depositing any considerable amount of records.

In establishing such a building, the United States will not be taking a leap in the dark. It will have as a guide to its efforts the experience of practically every civilized country on the face of the globe. England, France, Italy, the Netherlands and nearly all the other European countries have already housed their important records in such a manner.

The British archives are deposited at the Public Record Office. Public documents were first systematically kept at the beginning of the twelfth century, by order of Henry I.

A professor of history at the University of Adelaide, South Australia, in commenting on the need of collecting documents into a central place, made the following statement:

"The truth is that these documents have a value which cannot properly be measured by money. They are the ultimate material on which a study of the country's history must be based and if they are lost they cannot be replaced. To safeguard them is a duty which we owe to the world."

These words apply equally well to the records of the United States Government. At present they are scattered in every state in the Union and in practically every foreign country. They have never been brought together because there has been no place to deposit them.

The national Archives Building must eventually come. The only question is, will it take a disastrous conflagration to stir Congress into action?

Mr. Ford's Page

THERE are times when an issue is not essential to a political campaign, and there are times when it is simply impossible to get along without one. Whether there be an issue is determined by the national guessers who are supposed to know (much after the fashion of the weather forecasters) which way the people are going to jump next time. For, it must be borne in mind, our public affairs as touching elections are not in the hands of men who have spent their lives studying what is best for the country and the people, but in the hands of men who are expert forecasters of the political probabilities.

"Which way will the people jump," is the whole political problem as it lies in the minds of all but a few men who are prominent in politics. Add, of course, what they may themselves do in the way of influencing the direction of the jump. All of the other matters referred to as "issues" are invented or adopted solely with reference to this jump.

An issue is not essential during times of great public unrest and dissatisfaction. That is, it is not essential in the view of practical politics. The condition of unrest indicates with almost absolute certainty that the public is going to jump away from the party in power. It always does. The task of practical politics, therefore, is not to bother about issues nor any real public problem at all, but about men; see that the man on the other side is a "safe" man. The super-control of both parties sees to that. The public exhausts its satisfaction in making the jump—and gets no tangible benefits from it.

But there comes a time, often, when an issue or even several of them are an indispensable part of the machinery of every campaign. Sometimes the issue is the outgrowth of real thought in behalf of the nation's interests; sometimes it is a straw clutched at in the sea of circumstance, an idea which temporary fashion has made popular. Have you ever taken the trouble to look over the political models of the past? How quickly a "platform" is abandoned after it fails to lift into office those who most solemnly sponsored it as the one and only plan of political salvation to which they swore endless loyalty. There ought to be a museum somewhere in which should be visualized the various political models which politicians have tried to sell the people. The 1880 model and the 1923 model, with all the models in between, would make a most varied group.

THE issues that are selected by parties are not the issues that make parties great. The difference between an Issue and a mere campaign device is that men can handle the latter, but the former handles them. The real Issue is no respector of parties or persons, but calls for the subordination of all to a great regenerative work or a great forward movement. Real Issues triumph regardless of election returns. The political rejection of great Issues is no hindrance to their acceptance by the forces that make parties and administrations to be mere straws. Every Issue that has changed the country has been thrown out of conventions and caucuses and parties and administrations, and still has triumphed. The question is not what issues shall the parties of today select, but whether there is due at this time an Issue which shall dominate the parties.

Here and there through the checkered history of the parties is to be found a genuine principle which has been injected into platforms and made an issue by the sheer necessity of the times, but they are not many; most of the issues are like certain invented plays in football which cannot be used next year because everybody knows about them.

There is obviously a hunt going on for an issue right now in this country. Party names are felt no longer to suffice. Trusty old slogans are felt to be worn out. The cheap claptrap which formerly passed current for sincerity is laughed at by the people. Appeals to party glories of the past have lost their magic—the Statesmen of the past sit on cloudy thrones of judgment judging all the parties of today. The appeal that "ours is the best man" has lost its power, since the parties have made themselves all but equal in the personnel of their leaders. So that there is nothing left for it but to find an issue.

But where is the issue? Once upon a time it was always possible for the outs to make an issue of the mistakes of the ins, but the mistakes of both parties are too fresh in the public mind to render that course very promising this time. Worst of all, in every Republican mistake it is possible to find Democratic participants, and in every Democratic mistake it is possible to find Republican participants, so that it would appear that party lines are less prominent in the actual pickings of government than at any other place.

So where is the issue? There are signs that some of the old issues have been taken out with a view to revamping them. In one case this is already done. One candidate is already in the fields against what he calls The League of Nations. No thrill passed through the country when the announcement was made. Staying out of the League of Nations isn't going to solve any problem, any more than going in is going to solve any problem. Reliable reports say that the biggest problem before the last meeting of the League of Nations was how it was going to pay its office salaries. The League of Nations is not and has not been and probably may not be an issue. Certainly it is not the issue upon which the United States will decide its internal problems.

The only justification for attempting to make Europe an issue in the coming campaign would be fear to take up American issues.

To find the American issue it is necessary to go down into the life of the American people. Unless politics is merely a diversion intended to take the people's minds off their own problems, it must go down into common life and deal with the problems that it finds there.

But it may safely be prophesied that politics is not ready to do this. It may safely be predicted that the percentage of facts over bunk in the proposals of the parties will not be increased over what it has always been. It is even doubtful if there will be an actual set of programs by which the parties will stand, each saying of its own written and pledged program, "This is exactly what we will do if we get the chance."

There will be no vital issues proposed for the simple reason that any genuine issue today would go straight against some strong and unjust piece of privilege or some long established and profitable practice, and this, of course, is not what any sensible politician is looking for. There are two supreme cowards in the world: one is gold, the other is politics. One hides itself on the slightest indication of difficulty, hides itself most quickly when it is most needed; the other grows pale at the slightest suggestion of differences of opinion. A vital issue always makes enemies, always injures unjust privilege, always alienates selfish support—and these are just the things that politics cannot endure.

It is sheer folly to follow any line of discussion that looks to politics for the next American Issue. Issues never originate in politics nor with politicians. They are born in the experience and honesty of the people, they are cradled in the million minds who touch them every day in practical life, they do not appear in politics until they have grown so big that they can dominate politics—and the whole story of American politics is the futile attempt to keep the biggest issues out of politics. Nothing is more disturbing than when a new Issue rolls into the political camps, and a real Issue always rolls into both camps at the same time.

The politicians themselves are probably misled just now. With one accord they expect the issue to come from the present grab bag of political small talk. If it comes from that source even the politicians will be assured and certain that it is *not* the big upsetting Issue. But if it comes like a mighty rushing wind from the sources of the people's long-pent thought and power, all men alike will know that it is an Issue which they never can decide, but which will judge and decide them.

The difference between a real Issue and a campaign device is that men can handle the latter but the former handles them.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

"Were You Ever Arrested?"

IT IS a question asked in the tone of impugning character. To be arrested is considered as a stain, and yet nothing seems to be pushed with so much vigor as the business of getting as many people arrested as possible. It is a serious thing to lay a whole population by the heels, render all classes and conditions imminently subject to the policeman's grasp, register multitudes on the books of police stations—a very serious thing, and some day there will be a giant protest about it, not from the arrested ones but from those who have some sense of what the practice portends.

Only recently a city newspaper wanted people arrested for "jay walking." In New York a raid is conducted against people sitting on newspapers on the grass. Here, there, everywhere, the most trivial actions are exalted to the sinister importance of crimes, and all sorts of people are taken into custody much after the manner of Russia.

The jail and police contingents of all our states and counties and cities are in consequence unnecessarily large. Police duty has expanded tenfold in ten years, and much of it is not connected with crime at all, but with the administration of the city's life and the promotion of safety. This work, of course, is excellent and is greatly appreciated by the public. The jail and police contingents are not to be blamed —it is the coterie who have succumbed to a passion for rendering the people a mob of lawbreakers by deluging them with laws that they must break if they are to move at all. In all administration of public order, police regulation can best be accomplished without arrests, yet the cry goes up for more and more arrests, and as a consequence the cost of jail and police contingents mounts higher and higher.

The cost, however, could be endured. It is the strong tendency toward making us a police-driven people that is to be denounced. Not only denounced, but abolished.

Mr. Johnson

MR. HIRAM JOHNSON takes his post-Armageddon stand, this time as a Presidential candidate. With him stands A. D. Lasker, of American Jewish Committee and Shipping Board fame. Whether in this case Mr. Johnson is the advertised or the advertiser remains to be seen, but no surprise will be felt if it turns out that Mr. Johnson is the advertiser. It is well known that Mr. Lasker still needs some favors from the present Administration, if he can get them, and it would naturally occur to his type of mind that the best way to dicker for those favors is to appear in the field with a Presidential contender at his heels. Mr. Lasker may have seen the advantage of trading on Johnson possibilities for Coolidge consideration. In any case, it is not a flattering position for Mr. Johnson.

Our Duty in Europe

THE case of Europe becomes worse and worse. What once appeared to be the lowest ledge of woe is now desirable in contrast with what exists. The world slowly begins to realize that it is not "the war," but that the war was a minor phase: the war was not the cause, the war was but the beginning of a condition of which we are now beholding the development. A development only, for no one fancies it to be the end. Europe's misfortune is that she is morally bankrupt; there is not the most elementary confidence in the principles which upbuild nations; the fieriest carnival of hate and greed and determination to destroy, that the world has ever seen, is now at higher pitch in Europe than even during the war. The war was honest, noble, in comparison with what now exists.

And Europe's case will be worse. Bottom has not been struck. And bottom must be struck, for no outside aid can prevent it. It is ignorance and calumny to say that America could have prevented this. The time for prevention was twenty-five years ago, and that time cannot be recalled. As has been said in these columns often before, America can do two things only: she can with her money lend lease of life to institutions destined to disappear, and she can throw herself into works of humanity.

We have not done the first, and it is well. Money has been tried as a heal-all in Europe, and has failed. The loans recently made have gone no farther than the inside circles of government whose salaries and perquisites are thus guaranteed for another year or two. What mystic wisdom guided our people we do not know, but certainly the instinct which early told the American people that Europe's condition cannot be helped by gold, was a true instinct, and has kept us free for nobler work.

As to the future, America will perform a great work in world politics. There is no doubt of that. America may not be in the League, but America is in the world, moreover she is in the destined place of world reconstruction. If Europe were being reconstructed today there is no doubt that America would be chief burden bearer in that work. But Europe is not being reconstructed, Europe is not through with the chastening changes that are accompanying her transformation. The help asked of us now is to prevent the demolition necessary to reconstruction. All that kind of help is futile. Nothing is passing out of Europe but what is destined to pass. The land and the people will remain, and the great traditions that were created before degeneration set in. And upon the land and the people and the great heritage of the centuries, minus their degenerate accretions, a new Europe will be set up—and America will not be absent from that work.

Billion a Year to Fraud

PEOPLE have been buncoed for generations, yet the bunco business seems to increase rather than decrease with the growth of intelligence and the passage of time. The Investment Bankers' Association has just heard from the Government that One Billion Dollars a year is the monetary loss of the American people in fraudulent investment enterprises. The monetary loss is not all, nor is it the most costly; there is the loss of confidence in business men and business proposals, tantamount to a loss of confidence in human nature. American business men bear the brunt of it, and the truth is that *American* business men are not the offenders. Some day *American* business men may have to band together to shield the name.

There are sufficient losses in the higher regions of business, even that region represented by so distinguished an association as that of the Investment Bankers, and some of the losses are due to the deliberate action of men who know of no other way to make a profit than by others' losses, but it is not these that make up the bulk of the losses suffered by the people. Perhaps the people have come to believe that if a really big good thing exists there is money enough in the upper circles to take care of it, and that no really good proposition needs to be peddled among the people. So that a majority of the losses are incurred in propositions that look like bargains or good chances. The lady who expected ten yards of silk for ten cents, got ten yards of silk thread; and the gentleman who sent $18 for a dozen quarts of "pure Canadian rye" received, as advertised, exactly a dozen quarts of pure Canadian rye—but it might as well have been oats or wheat. More pretentious chances like oil promotion mulcted the people of hundreds of millions during the past two years. Fraud orders are being issued all the time by the Government, and more than 400 criminal cases against oil promoters alone are awaiting trial.

The story has been told and the warning issued numberless times in the past, but it seems that the business pirates who swing easily from one line of promotion to another, can usually count on about One Million Persons who are always ready to bite.

That is, One Million Persons a year. And of course they repeat, some of them, year after year. Which leaves a pretty large percentage of Americans who cannot be sold a gold brick.

The principal safeguard against gullibility is the knowledge that in this world it is not the rule for anyone to give something for nothing.

The President's Ambassador

THAT President Coolidge is politically reactionary everyone knows. Strangely enough, this does not lessen the general desire that he prove himself a good President. The country has almost reached the point where it is willing to let a President's politics be what they may, if he will only perform a good job of getting the United States going properly and giving the people their rightful weight in government.

President Coolidge's extreme conservatism or reactionism has been indicated in several matters, each of which has been accurately judged by the public, but none of which has been used against him. He had a right to call as his secretary any politician he chose. He has a right to appoint as ambassador to Great Britain as reactionary a man as he likes. On the theory that the ambassador is the President's representative to foreign governments, it is not surprising that Mr. Coolidge should appoint the reactionary Mr. Kellogg. It is quite the custom now to put into government service as speedily as possible the very men whom the people refuse to put into government. A directory of public officials who have been retired by the people's ballot and then returned to public life by Presidential appointment, would be a useful handbook. Neither would it be surprising if, in appointing Mr. Kellogg, Mr. Coolidge should imagine that he is appointing a Progressive, for in the days when trust-busting was the favorite sport of politicians and perfectly harmless to the trusts, there was some talk of Mr. Kellogg being a trustbuster. His subsequent history, however, has largely overlaid that chapter in his life, and his latest political activity was on the side of the most reactionary element against the Progressives.

However, as has been said, Mr. Coolidge, being of the extremely conservative type, has the right to appoint as his representative at the Court of St. James a man of the same type. It has not been laid up against Mr. Coolidge—as yet. Reactionaries and Progressives alike have ceased to thrill the people. In action one seems to be as impotent as the other. With probably three exceptions, the leading Progressives of today will be the reactionaries of a near tomorrow. Some of them are only Progressives for effect, as it is. Indeed, does one not recall that one of the most highly touted of the Progressives was helping out the side that Mr. Kellogg espoused in his own state, and that only recently?

You cannot tell them by their names. For which reason Mr. Coolidge will not find this classification against him if he shows the quality which the country hopes he possesses.

France Flocking by Herself

IT BECOMES more definite every week that American opinion and British opinion on European affairs move substantially in the same channels, and both move more and more in an opposite direction from that of France. Mindful of the sufferings of France during the war, there was at first a disposition to allow France to quiet her fears of a new attack from Germany as best she might, even to the occupation of the Ruhr and the exaction of certain guaranties. But French policy becomes more distasteful to the world as time passes, probably because so futile in the accomplishment of its announced design, not to mention its repugnance to the world's idea of peace and humanity. It is right that France should be paid and that Germany should be made to pay, according to the terms which she signed. But it is also right that Germany should be permitted to know what she shall be required to pay in all, and it is right that the world should be authoritatively informed as to Germany's ability to pay —a matter which has been raised in question. The government of the United States, pursuing the most direct course to the facts, proposed that the governments get together and examine Germany's ability to pay, not for the purpose of exculpating Germany, but for the purpose of arranging the payments on a possible plan. Almost anyone would be willing to let his debtor up long enough to see how much his debtor possesses toward the payment of the debt. But this common-sense proposal has been refused by France, although concurred in by Great Britain, and thus a rift between the French and the two English-speaking nations has ensued. It is a doubtful game that France is playing, from the point of view of practical business an unwise and unprofitable game, and, if not soon abandoned, one that is likely to be remembered with regret by all neighboring nations. France will probably find that abandonment of it in whole or in part will be good business and good statesmanship.

"Get Back to Lessons Our Mothers Taught Us"

Ed Howe's Gospel, That Has Made Him So Beloved of Kansans

By FRANK M. CHASE

"I SHALL be glad to see you at any time this month," ran the letter written in an irregular hand on a piece of rough paper, of the size and quality indigenous to the news room; "and expect you to lunch."

Ambling lazily along, the one-man street car took me to the higher and residential section of Atchison. A moment's walk then brought me to a stately dwelling of red brick, high above and well back from the street. Wide lawns, dotted with well-grown elms and maples, stretched away to either side. Having mounted the two flights of stairs leading to the entrance, I was about to ring. Before I could do so, however, a slender, neatly clad man of average height, with white hair topping a smooth-shaven face of singular force, opened the door. It was Edgar Watson Howe.

Handshaking over, we passed into the large living room where I was presented to Miss Adelaide Howe, a niece, who lives with Mr. Howe and is his devoted companion. In a moment she left to prepare the luncheon to which I had been invited, while my host chatted pleasantly in his homely, characteristic way. Outside, the warm sun was chasing away the last remnants of a sudden coolness which, the night before, had broken the heat and sent householders scurrying for blankets. It was the season's first suggestion of autumn, and Mr. Howe was thinking of Miami, his winter home. Presently it occurred to him to show me some letters he had recently come across, and he led the way upstairs.

One was conscious mainly only of the host's engaging personality, but within five minutes after entering the house I was looking over letters which Mark Twain, Howells and others of the literary great, had written him forty years ago. Within four hours we had dined, had leisurely gossiped of men and things literary, political and moral, and I had obtained the story of a particularly rich and eventful life. E. W. Howe is a very simple man, and very direct. He thinks and works fast.

The reasons for Mr. Howe's facility reach back to his boyhood. Seated in a low rocker in the high-ceilinged corner bedroom to which he had taken me, he related the circumstances that made of him a rapid worker, and told the story of his life. About him were the evidences of editorial labor. The floor was strewn with newspapers. In one corner stood a very plain roll-top desk. Here and there, in various stages of completion, were bulky piles of hand-written copy.

"I was born May 3, 1854, near what is now Treaty, Indiana," he began. "My father was a Methodist preacher, and one of the wisest men I ever knew. But he was visionary, impulsive, and restless. When I was three years old we moved to Northern Missouri. There, because of some statements made in the course of a debate with another preacher over whether the Bible approved slavery, he was accused of inciting slaves to revolt and was sentenced to jail. He was released on bond until after the war, however, and nothing more came of the matter.

"Coming home one day, he announced that he had bought the weekly paper at Bethany, the county seat. The next morning he took me to town and, turning me over to the foreman, said I was to learn to be a printer. Though I was but twelve years old when I commenced, within six months I was compelled to set two columns of brevier a day or take a whipping at night. For a while I submitted to the punishment, thinking it would soon end, but it didn't. If I didn't finish my two columns before going to bed, I had to take another whipping the next morning. My brother Jim always did his work on time. Then he would help me finish what I had neglected during the day. But he was so good that I disliked to impose on him, so I began to work as rapidly as I could. The result was that I became a fast worker habitually, and I have always been exceedingly glad of it."

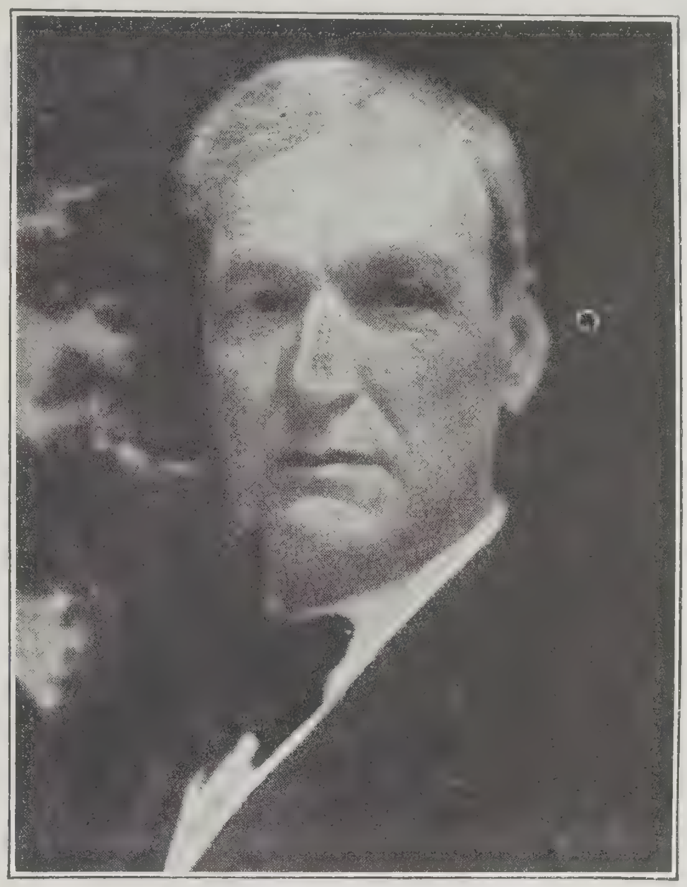
Apparently roving blood was in Edgar Howe's veins, as well as in his father's, for at fifteen he was a tramp printer. Denver, Salt Lake City, Cheyenne and Omaha were among the frontier towns in which he worked, reaching some of them ahead of the railroad. During these wanderings he engaged in numerous typesetting contests in which he was usually the victor, defeating some of the fastest printers of the day. At nineteen he established a weekly paper in Colorado, the *Golden Globe,* but admits it was so badly edited that he destroyed the files to keep his children from seeing them. Later he went to Falls City, Nebraska. It was from there that he went in 1877, then twenty-three years old, to Atchison, Kansas, to start the paper which was to carry his name around the world.

In the beginning the Atchison *Globe* was a single sheet of four columns, printed on both sides, started with $800 which Howe borrowed on his house and lot in Falls City. Associated with him in the enterprise was his half-brother, Jim, and the two performed all the work of getting out the sheet.

"To introduce the paper," Howe said, "we hired boys to leave it at every house in town for two weeks. At the end of that time the boys went around to induce the families to subscribe for the paper at ten cents a week; that being, so far as I know, the first time a daily was offered for that price west of the Mississippi. The result was that nearly every family in town subscribed, and in most cases paid for the two weeks the paper had been delivered without charge.

"Our policy was to print every possible item of news and to be just as helpful and beneficial to the community as possible. I made it my business to know every person, white or black, and every dog in town, or that came to town. Usually I would be on the street by ten o'clock, and except for a few stops at the office to leave copy I wouldn't leave until night, or, when we got to printing in the afternoon, until shortly before press time.

"The paper paid from the start and we were able gradually to increase both the staff and the size of the paper, though my brother had to leave because of ill health. Every person on the paper was a reporter, but solicited, and often wrote, advertising as well. Most of our men wanted to divide their work—solicit advertising part of the day and gather news the rest of the time. Due to my father's rigorous training, however, I was able to do both at once, and faster than any three men I could hire. Of course, I kept moving. Once I sat down to talk with a man who was deaf, and the fact that I did so was a matter of comment up and down the street for several days.



EDGAR WATSON HOWE

"It has always been comparatively easy for me to write paragraphs," he went on. "They come to me without any special effort on my part, and I put them down. At first, after the *Globe* was started, I scattered a few of them through the paper. Then, as they began to be quoted, I put them together under the 'Globe Sights' heading, which, I believe, was the first column, as it is now known, to be conducted by an American daily. The feature attracted so much attention among the papers of this region that we sent the *Globe* to a few of the large Eastern papers, to introduce it there, though this was soon unnecessary. We always tried to make our reporting as sprightly and entertaining as possible, and the papers began to copy many of our news items also. One day a copy of the paper was returned from the Boston *Globe.* On the wrapper was the notation 'Nothing in it.' On looking through the copy, we found that sixty-seven items here and there had been clipped out. Papers everywhere copied our matter. Though nine-tenths of its news was local, the *Globe* had subscribers in every civilized country, and for years was known as the best quoted paper in the world."

Throughout the thirty-four years that Howe was in charge of the Atchison *Globe* he remained the chief reporter of all and bore the greatest burden of responsibility. Quite naturally those years of incessant labor exacted their toll. Several times, the state of his health making it imperative that he leave his work, he made long trips. Once he went around the world. Even then he wrote a letter for the *Globe* every working day of his absence, these letters being one of the very best of the many notable features of this paper. Collected in their two-volume book form, "Daily Notes of a Trip Around the World," they have been highly and widely praised. "Travel Letters from New Zealand, Australia and Africa," "The Trip to the West Indies" and "Paris and the Exposition" contain further records of his travels.

Despite his busy days Howe had, when scarcely past twenty-nine, completed the book that was to yield him unending literary fame. "Should 'The Story of a Country Town' find readers," he says in the preface to the book, "it may be interesting to them to know that it was written entirely at night, after the writer had finished a hard day's work as editor and publisher of a small evening newspaper. I do not think a line of it was written while the sun was shining, but in almost every chapter there are recollections of the midnight bell."

After completing the manuscript he had it put into type in the *Globe's* shop, and a number of proofs were taken. In this form he submitted the book to all the publishers he could learn of, but rejection came in every case. Among a number of the literary leaders of the time to whom Howe also sent proofs of the book was W. D. Howells. With his peculiar literary perception, Howells detected the elements of greatness in Howe's book, and in the *Century* magazine praised it accordingly. The result was that fully a half-dozen of the publishers who had rejected the book immediately sought the privilege of printing it. Mr. Howe accepted the first offer. The book was first published in 1884, and had a large sale. Unlike most "best sellers" it continued to find buyers for years, and is even now regularly bringing royalties to its author.

Among the letters, each in the handwriting of its author, that I was privileged to see, was one from Howells which, referring to "The Story of a Country Town," read: "It is a very remarkable piece of realism, and constitutes a part of the only literary movement of our time that seems to have vitality in it." From Mark Twain the book called forth a letter of seventeen pages, in the course of which the great humorist wrote: "Out of the six and thirty million times I have been asked for an opinion about a book I believe this is the first time I have ever furnished one—not that I am loathsome and unsympathetic, but because the books were worthless."

Howe has always taken his obligation to his community seriously. One of his cardinal ideas about running a newspaper, in fact, is to help the community, but to do it in such a way that the people think they are mainly responsible for the progress made. If the paper doesn't keep ahead of its readers in figuring out what the community needs, he says, the editor will soon find that the town is running the paper—that he is merely following the crowd.

One of the numerous "firsts" to be credited to the Atchison *Globe* is the fact that in its columns originated political advertising. The shrewd Howe had not been running the paper long before he saw the advantages—to him as well as to the office-seeker—in getting the candidate's solicitation into the newspaper. But before political advertising came into general use Howe employed it very effectively in causing the election of candidates that he felt would be most useful to the community. Without apparently taking any part in the contest, he would go to the candidate he favored, persuade him to carry on his campaign through the *Globe,* at paid rates, and perhaps write the copy for the advertisements. In this way, despite the fact that Atchison was overwhelmingly Republican, he secured the election of Democrats, when this seemed best, and brought about other political results equally surprising.

Though he does not know one note from another, Howe has always been an enthusiast for good music—especially band music. Wherever his travels have taken him he has made it a point to hear the best music available, and has frequently made long trips purposely to hear a noted band or orchestra.

Reflecting on the limited opportunities which the country folk around Atchison had to hear good music, it occurred to Howe many years ago that a good way to celebrate the *Globe's* birthday would be to hire a band and invite the people to spend the day listening to it. Accordingly he employed a professional band of sixty pieces. From miles around the people came—fifteen thousand of them. Howe says he never had more pleasure in his life than just wandering around among the crowds that day, watching the people enjoy themselves.

Has Atchison appreciated Ed Howe? There is pretty conclusive evidence that it has. Else wherefore the rare and costly watch, and the silver water set, that a grateful populace has presented Mr. Howe in token of its gratitude? Yes, Atchison loves Ed Howe, and accepts his retirement from active service in it with keen regret.

But he had served Atchison long and faithfully, and had fully earned a rest. Accordingly, in 1911, he turned the paper over to his son Gene, issuing the first number of *E. W. Howe's Monthly* in January of the same year.

E. W. Howe's Monthly is a journal of comment and opinion, devoted, as its legend runs, "to indignation and information." On its mailing list are the names of captains of industry, of financiers, powerful editors, well-known literati, as well as many plain citizens of the thinking type. In the public prints it is not unusual to find editorials and articles inspired by a paragraph in this curious sheet.

"We need to get back to the simple things," said Mr. Howe, "to the lessons our mothers taught us at their knee: to behave ourselves, to be honest, to treat others kindly, to be useful, to do as much as we can as well as we can."

And that is the gospel according to Howe. As he goes into his seventieth year he shows no sign of diminishing the vigor with which he upholds his creed; if anything, his pen takes on added edge to support his convictions. E. W. Howe is a simple man. His philosophy coincides with his person. He lives and preaches the gospel of common sense.

'Big Board' of Brokers Wall Street's Monopoly

Denials That Stock Exchange Is Privileged Do Not Agree With Facts

By CHARLES ALBERT COLLMAN

THE great barometer of Wall Street's speculative prosperity is always the price of Stock Exchange seats. Within recent times the cost of memberships has fluctuated between $98,000 and $100,000, but the other day the price slumped to $80,000, although later a seat changed hands at $82,000. These are index figures, showing the dull state of trading. Giving proper consideration to the economic conditions that have affected Wall Street, it must be admitted, nevertheless, that the decline of public confidence in the operations on the Stock Exchange is due in great part to the exposures made in the last two years of bucketing, stock swindling and fraudulent promotions.

The mere collapse of thirty to forty brokerage houses was viewed at first with little concern by members of the Stock Exchange. But the long-drawn-out prosecutions of the principles of these firms have had the subsequent effect of increasing the distrust of Wall Street. Developments of the last week or so have shown that the failures were much more reprehensible than at first appeared. When the firm of S. S. Ruskay and Company closed its doors in February, 1922, it was announced that the liabilities were $4,066,047, while the books showed that there were on hand customers' securities valued at between $5,000.000 and $8,000,000. It now transpires that the liabilities of the brokerage house were actually $10,000,000, a sum twice as large as at first indicated, while it held only $300,000 in stocks and bonds and $150,000 in cash. In the affairs of Kardos and Burke, it is shown that New York Stock Exchange houses are indebted to the firm for large sums, for the restitution of which proceedings have been begun, and evidence has been presented that Raynor, Nicholas and Truesdell, who failed for $4,000,000, bucketed their customers' orders by trading against them in Stock Exchange houses.

Not Monopoly, Says Cromwell

THE president of the Stock Exchange, Seymour L. Cromwell, has been touring the country on "a campaign of education" regarding the country's great market place for share and bond securities. To those familiar with present conditions in the street, the need for the president's tour is apparent. Mr. Cromwell is quite within his rights in defending the institution he heads against indiscriminate blame for the bucketeers, but his reasoning is not so clear when he says, as he did in his address at Fort Wayne, Indiana:

"The Exchange is not a monopoly. It is and always has been a private organization, competing actively with the outside security-dealers' markets."

Is not the New York Stock Exchange a monopoly? An examination of the history and constitution of this organization ought to show whether it is the possessor of exclusive privilege.

The present Stock Exchange has grown from a nucleus formed when a small group of brokers in Wall Street, in 1817, adopted a constitution. Between the years 1831 and 1837, the brokers met on the second floor of a building which an Englishman, named Jauncey, had once used as a stable, and which occupied what now is No. 43 Wall Street. The room in which they then sold stocks had once served as a hayloft. At about this period there were eighty-eight members and the initiation fee for membership was $400.

By the year 1842, the brokers had increased in numbers and importance, and felt the necessity for more pretentious quarters. They then engaged room in the Merchants Exchange, which occupied the site of the present National City Bank. At one end of the room was the rostrum at which the president stood, gavel in hand, to "call the stocks," while the secretary scribbled down the records of the transactions. Two parallel rows of massive columns ran lengthwise the hall, while in the nave stood a long table forming three sides of a hollow square, at which most of the members had their seats. At each side of the room was a raised platform which supported a number of separate desks. The brokers wore high stocks, swallow-tailed coats, and tall chimney-pot hats of a fashion long since departed, which they frequently laid aside as they leaped from their chairs and, with emphatic gestures, shouted their bids and offers.

Then came about a combination of all the brokerage groups which transacted business in Wall Street in 1869. The merger of the Stock Exchange, which had 533 members, with the Open Board of Brokers, with a membership of 354, and the Government Bond Board, having 173 members, was effected in May, 1869. The Open Board ceased to exist Monday, May 10. These brokers, who had traded for five years under its auspices, signalized its decease by singing "Auld Lang Syne" when the day's work was done. Then they carried their first vice-president, George Henriques, out to Delmonico's, seated in his official chair, and brought him in triumph to the Stock Exchange Building. The consolidated brokers now numbered 1,060. Afterward, in December, 1879, this number was enlarged by the sale of forty additional seats to its present full quota of 1,100. Since this date, memberships in the Exchange have been restricted to 1,100.

In other words, in the last forty-four years, not a single additional seat has been sold on the Stock Exchange. Membership has become an exclusive privilege, always confined, at any one time, to 1,100 men. In those forty-four years, the country's railway, industrial and commercial expansion has been without parallel. Corporations have been organized, whose individual capitalization runs from hundreds of millions to as high as one billion, but their securities, in stocks and bonds, as we shall see, cannot be traded in in any part of the United States, unless bought from the hands of these 1,100 men.

In view of the membership restriction observed by the Stock Exchange, it is not remarkable that the prices of seats are advancing by bounds from year to year. In 1842, they commanded a price of only $400. After the consolidation of brokers groups in 1869, the value of memberships at once increased. The growth of such values is seen in the following table:

Prices of Seats on the New York Stock Exchange

	High	Low
1869	$ 7,500	$ 3,000
1879	16,000	5,000
1889	23,000	19,000
1899	40,000	29,500
1904	81,000	57,000

Within the last few years, as previously stated, the values of seats have fluctuated between $98,000 and $100,000, until the present slump in stock market operations drove the selling price down to $80,000.

In 1879, when membership was first placed at 1,100, the total sales of stocks for the year amounted to 72,765,762 shares, or an average of 66,150 to each member. Within the last few years, the number of shares of stock traded in on the Exchange aggregates 250.000,000, making an average of 227,272 sold by each member. The commission house business has increased more than threefold, while the membership remains numerically the same. It may readily be seen what this membership restriction means to the broker, in view of the active growth in stock speculation, and in the increase in the number of corporations and their volume of capitalization:

	Shares of Stock Sold on the Exchange	Commissions Paid to Brokers (estimated)
1879	72,765,762	$ 9,000,000
1920	226,640,395	28,250,000

Here it is seen that while commissions paid to the 1,100 Stock Exchange brokers in 1879 aggregated $9,000,000, the commissions to the same numerical group of men aggregated $28,250,000 annually at a period forty-one years later. This is only part of the tribute exacted yearly from the country by the New York Stock Exchange, for it does not include the commissions on the huge amounts of bonds sold, that are listed on the Exchange. For the first eight months of the present year, 210,226,637 shares of stock have been sold on the Exchange, and during the same period the sale of bonds has amounted to $3,488,976,107. Is it any wonder then that Stock Exchange seats, which were worth only $400 each in 1842, should now command prices ranging from $80,000 to $100,000? The monopoly of memberships in the Exchange, and their numerical restriction, if continued, must inevitably result in creating a group of 1,100 multi-millionaire brokers.

Free Trading Is Barred

IT IS a far cry from the old Wall Street stable, in the year 1831, with the brokers gambling in its hayloft, to their present quarters in the impressive marble building at the southwest corner of Broad and Wall streets, with its sculptured façade, its colonnade of fluted Corinthian pillars, its pediment containing the celebrated group of marble statuary, its white and gold board room and its huge twin annunciator boards. There is no need to envy the Stock Exchange brokers their prosperity, but *the fact remains that this prosperity is due to no especial gift, probity or trading ability on their part, but solely to the fact that there is no free trading permitted in the stocks and bonds of most of the great corporations in the United States outside the walls of the New York Stock Exchange.*

A glimpse at the constitution of the Stock Exchange, and its peculiar provisions, will make plain how this trading monopoly is maintained:

Constitution of the New York Stock Exchange.
Article XVII.
Expulsion and Suspension from Membership.

"Sec. 4—*Any member, who shall be connected directly, or by a partner, or otherwise, with any organization in the City of New York which permits dealings in any securities or other property, admitted to dealing in any department of this Exchange, shall be liable to suspension for a period not exceeding one year, or to expulsion, as the Governing Committee may determine.*

"Sec. 5—*A member making a transaction with a non-member in the rooms of the Exchange, either purchase, sale or loan, in any security or property admitted to dealings on any department of the Exchange, or in money, shall be subject to suspension to such period not exceeding one year as the Governing Committee may deem proper."*

In view of the foregoing rules, Mr. Cromwell does not seem quite justified in making the statements he has voiced in his educational campaign. In his speeches, he has told the people of the Middle West:

"The Exchange is not a monopoly; it is and always has been a private organization, competing actively with the outside security-dealers' markets, the out-of-town and foreign exchanges and security auctions. *As far as the New York Stock Exchange today is a dominant market for any security issue, or any class of security issues, this leading position has been due not only to its advantageous geographical position but to the superior services it has been able to render the public over competitive markets in this and other countries."*

Mr. Cromwell may be correct in insisting upon the advantages of one central market for the sale of securities, which establishes the ruling prices at which they are sold, but the superior services the New York Stock Exchange renders in this respect are occasioned solely by the rigid restrictions hedged about the transactions of its members and the similarly rigid restrictions it imposes upon the directors of railroad, industrial and other corporations in the sale of their securities, the disposal of which it absolutely controls. It is not a competitive market; it is an exclusive market.

How the New York Stock Exchange exercises complete control over the sales of stocks and bonds of the leading corporations in the country, may be seen in the following:

Article XXXIII.
Transfer and Registry.

"Sec. 1—Corporations whose shares are admitted to dealings upon the Exchange will be required to maintain a Transfer Agency and a Registry Office in the City of New York, Borough of Manhattan. Both the Transfer Agency and the Registrar must be acceptable to the Committee on Stock List, and the Registrar must file with the Secretary of the Exchange an agreement to comply with the requirements of the Exchange in regard to registration.

"Sec. 4—*The Governing Committee may suspend dealings in the securities of any corporations previously admitted to quotation upon the Exchange, or it may summarily remove any securities from the list."*

Subject to Exchange Rules

IN OTHER words, any corporation that lists its stocks and bonds upon the Exchange can sell its securities only on the floor of the Exchange, through the medium only of its 1,100 members, and subject to the restrictions of the Exchange, which may strike such securities from the list and destroy the market for them at its option. It is by no means intimated that the Governors of the Exchange use this tremendous power unjustly. Their power, however, was exercised recently to the destruction of the market for securities of two large corporations, to their great financial injury, but whether rightfully or wrongfully the individual circumstances must determine. The point is made that the possession of such power gives them a country-wide trading monopoly.

A man may be a shipper, whose business feeds some great western trunk lines; may be an employe of a mining company in Arizona; he may be a resident of Boston, Chicago, San Francisco or New Orleans; but if he is interested in any corporation with which he has dealings, or wishes to invest in a bond or share of stock in some local company with whose business he is familiar, and whose securities are listed on the New York Stock Exchange, he must buy such securities from one of the brokers of the Stock Exchange and pay that man his commission. Whatever local broker he may be dealing with, that broker is compelled to fill his order through a New York Stock Exchange house or one of its branches.

To accommodate this extensive business, most of the New York Stock Exchange firms have established branches, some as many as thirty or more, in Massachusetts, Illinois, Missouri, Florida, Canada—in short, wherever they feel that speculators or investors are to be found willing to pay their individual tribute to the monopoly of New York's Stock Exchange. The amount of business the Exchange is in a position to handle exclusively may be shown in Mr. Cromwell's own words: *"Securities with an approximate valuation of $62,000,000,000 (sixty-two billion dollars), are authorized to be traded in on the floor of the Exchange, and these securities cover the whole panorama of the business life of the country."*

It is quite natural that the president of the Exchange should defend stock speculation and stock speculators, who, he says, "are needed at all times by American industry to absorb its risks and make conservative investing possible for other less daring men." Speculation is the corner stone of the Exchange, and the losses of generations of margin traders have paid for the giant marble structure which represents the gambling hall of Wall Street. "Buying on margin," the delusive process which has secretly drained the assets of many a business firm, led bookkeepers into embezzlements and clerks into thieveries, which is to be reckoned with as an annual economic loss to the country, has created rich brokers and fattened the values of their Stock Exchange seats. It is a pretty certain conclusion that however wide are Mr. Cromwell's travels, and however numerous his speeches, he will never be able to convince the country that stock speculation is legitimate, beneficial or necessary. No one can be better posted than the head of the Exchange on what is going on in Wall Street today. The professional stock gamblers, the leaders of pools and cliques, the very names of whom are undoubtedly quite familiar to Mr. Cromwell, are not serving American industry in their present activities in driving the prices of legitimate securities below their just levels. Not by any stretch of the imagination can they be said to be "absorbing the risks of business," and when they have reformed their pools and churned up prices to fictitious figures, they will not have made "conservative investing possible for less daring men."

A Great Intellect Lived in This Frail Body

One Who Had Opportunity to Talk With Steinmetz Tells of Some of His Work

By JULIUS MORITZEN

CHARLES P. STEINMETZ

IT WOULD need another Charles P. Steinmetz to present effectively the peculiar qualities that made the late electrical genius and mathematician so outstanding a figure in the world of applied science. His mind partook so much of the unusual that even those standing closest to Dr. Steinmetz frequently failed to plumb the real depths of his nature. If ever a great intellect resided in a frail body, this was the case with him. He was a scientist par excellence, and yet so naïve in many ways that those who knew him loved him for exactly what he was.

That the world lost one of its shining lights in the passing of Charles P. Steinmetz is but to say that he left behind a heritage that neither wealth nor position can equal. Future generations will get the full benefit of the achievements of this remarkable man whose coming to America as a poor youth marked a chapter in the history of invention. Perhaps too much is made of the fact that Charles P. Steinmetz came near being excluded by the immigration authorities because of certain disabilities, particularly a deformity that showed a stunted body with a large head out of proportion to his size. Through the intercession of a young American who had been his fellow-student at the Zurich Polytechnicum, Steinmetz was allowed to enter. With what result the accounts rendered of his activity by the whole world at his death are the most eloquent illustration.

In this present instance the purpose will be largely to furnish an impressionistic picture of Dr. Steinmetz as he appeared to this writer the past summer, shortly before he set out on that journey which was to precede his death by so short an interval. The occasion was a visit to the works of the General Electric Company at Schenectady and Pittsfield. Already, then, Dr. Steinmetz had but shortly recovered from a serious illness, but he was persuaded to meet the writer and other members of the Association of Foreign Correspondents in the United States invited to inspect the plants, largely with a view of witnessing the remarkable experiments with high voltage electricity then astonishing the scientific world.

Dr. Steinmetz's title of consulting engineer to the General Electric Company was an all-embracing term to the extent that it brought him within the environs of almost every activity put forth by that organization. It was in that capacity that he supervised the epochal experiments with high voltage electricity which in some instances reached the enormous power of 2,000,000 volts.

Standing with Dr. Steinmetz there in the great laboratory with its labyrinthial machinery devoted to the production of electric energy, it needed no great flight of the imagination to believe that this was the very workshop of nature in all its ramifications. For the layman it is not easy to follow the intricate factors entering into the manufacture of "artificial" lightning, as it was soon to flash before the eyes of the visitor while all around was total darkness. This 2,000,000-volt experiment is one of the most awe-inspiring yet beautiful spectacles imaginable. And there, at your side, stood the diminutive form of Steinmetz, the creator with Dr. Faccioli, of the Pittsfield works, of what may be considered one of the most startling experiments the world has ever witnessed in that particular domain of electric power production.

The explanation offered subsequently by Dr. Steinmetz was so lucid that the least scientifically inclined individual should be able to understand it. He said: "The flash that you have just seen represents 2,000,000 volts, far exceeding in voltage any former experiment with artificial lightning. Although concentrated for but a fraction of a second, it represents the force of 10,000,000 horse power. As you will have noticed, the tests are conducted in this steel-inclosed laboratory to prevent any disturbances from reaching the outside and causing possible damage. Every precaution is taken to safeguard the employes. Automatic switches or traps make it impossible to turn on the current when anyone is within the wire fence which surrounds the high voltage apparatus.

"It is often supposed," continued Dr. Steinmetz, "that lightning, could it be harnessed, and controlled, would furnish limitless power at little or no cost. As a matter of fact, a lightning bolt, even could it be utilized, would have a commercial value of about one and one-half cent. In the course of our experiments, the Consulting Engineering department has conducted tests to determine the actual value of artificial lightning up to 2,000,000 volts.

"Although tremendous power is contained in the lightning bolt, it is of extremely short duration, since the flash begins and ends in less than a thousandth of a second. The estimated voltage of the average lightning bolt is 50,000,000 volts. If the assumed amperage of such a bolt, estimated at 1,000 amperes, is multiplied by the number of bolts, a power of 50,000,000 kilowatts is obtained. This energy, if exerted for one second, produces only 500 kilowatts, and for a thousandth of a second, one thousandth of this amount. Hence, if electrical energy costs ten cents a kilowatt the value of a lightning bolt is approximately 1.5 cents."

A part of the artificial lightning demonstration was the direction of the full fury of this force against a miniature village, specially constructed upon the floor of the laboratory. This spectacular experiment was significant apart from its direct objective—the efforts of the engineers to improve and extend the present system of high tension transmission lines and to nullify and prevent the destructive effects of natural lightning. It had been discovered that when the artificial lightning struck a block of wood placed in its path, part of the wood disappears and cannot be accounted for.

"As you will notice," Dr. Steinmetz explained, "a small hole is found through the block, not having the appearance of being burned out. The wood surrounding it gives off a peculiar pungent odor. The portion of the wood which has disappeared probably may have been changed into another element, perhaps a gas. This opens a great field for speculation.

"A million volts or two may never be necessary for power transmission but if the time comes we will be prepared. Our tests have shown us the characteristics of electricity at such high voltages and we are able to determine the size of cable, the height of the towers, the method of protecting against lightning and other essentials which will be required when the day comes.

"The one energy which remains to be utilized is the light of the sun, in comparison with which the total energy supply of all the fuel we burn and the hydraulic energy of all the coal and all the water power we have and use in a year does not amount to more than a billion kilowatts. The energy of the sun, which shines only upon that part of the states which is arid and cannot be used for agriculture, is about 800,000,000 kilowatts, nearly 1,000 times as much as all the coal and water power together.

"When we burn coal we are using the sunlight which was stored millions of years ago by the plants in the primeval forests during the coal age. When you use water power you are using solar-energy which evaporated the water and was carried up into the clouds, whence it was condensed and deposited on the highlands, and now runs in the rapid river, to be collected by us and made to turn the wheels.

"The question of feeding future populations opens up a new field for the biological engineer. In the past there has never been any systematic method of producing proteins. The natural protein-producers are the micro-organisms which reproduce at an economically rapid rate.

"The leaves year after year collect the energy of the sunlight, absorb it through the chlorophyl and produce chemical compounds. We have all around us the collections of solar energy by plant life, but it takes a lifetime for a forest to grow and collect energy.

"Why could not the biological engineers of the future develop new forms of vegetation which would collect the sunlight at a rate hundreds of times more rapid than our present vegetation collection scheme? Perhaps the tall grasses might be the starting point from which by a process of selection, during generation after generation, we could work toward new varieties and find new species which would grow at such a rapid rate that we could raise energy crops and so collect energy from our lands to supply our needs, especially if we can obtain high grades directly, without going through the transformation of heat.

"In the production of food we use two classes of compounds, the carbohydrates and the nitrates, the first of which are essentially heat-producing, and the second life-giving. The carbohydrates will be taken care of by the energy crops already mentioned. Then there would remain the problem of the nitrogen supply of the world, the protein supply.

"Now, we have done much in producing new plants, but where each generation takes about a year, in micro-organisms we may have a generation a day or several generations."

The life of Charles Proteus Steinmetz is so well known as a whole that it would seem unnecessary to speak of it in this place. However, to round out his activity it may be stated that he was born in the city of Breslau, Germany, April 9, 1865, and educated at its famous university. He early became interested in Socialism and for that reason incurred the displeasure of the German Government. Compelled to take flight he found refuge with a friend in Switzerland. Arriving in America, he first obtained employment as a draftsman in the manufacturing establishment of Rudolph Eickemeyer at Yonkers, New York. When this firm was taken over by the General Electric Company, in 1892, Steinmetz went along and remained there until his death.

Dr. Steinmetz wrote many books on the theory of electrical energy. He lectured extensively on this subject. His special field, in which he was most expert, included magnetics, symbolic methods of alternating current calculations and transient phenomena. It is not overstating facts to say that most of the great inventions of the company with which he was identified for so many years received the benefits of his remarkable power of analysis.

Mode of the Marionettes

Concluded from page 5

bility of a puppet, and this is the most essential requisite in modeling one of these dolls destined to become a "star" in the dramatic world.

In connection with the accentuated interest taken in marionettes by the younger set, mention should be made of two young women who started out from Santa Barbara recently and made a tour of all the villages in Southern California with a puppet show boxed in a Ford car. They met with the most encouraging success until they arrived at a large beach resort where they found competition too keen among the vast number of concessions, so they philosophically "pulled up their stakes" and took the road home!

The interest adults have taken in marionettes is well evinced by the attendance at a lecture on marionettes given before one of the largest women's clubs in this country. The speaker was Mrs. Clara Vostrovsky Winlow, noted lecturer on child psychology and writer of juvenile books on Czecho-Slovakia, the home of her ancestors and a favorite mart for marionettists. Together with her young daughter and a Russian professor and his wife, Mrs. Winlow has succeeded in assembling a whole tribe of puppets for the presentation of Russian fairy tales. She herself composed the plays for the puppets, her daughter did much of the costuming, and the professor built the stage and painted the settings while his wife constructed the admirably expressive *papier-mâché* heads for these traditional dolls.

There are various methods of manipulating marionettes. The Dando marionette worked by bars was one of the most frequently seen in Europe several decades ago, and it was with a Dando marionette that Mrs. Winlow played as a child in Nebraska to which her Czech parents had migrated. This wooden marionette of many jointings was coveted by her playmates and doubtless implanted a lasting love in Mrs. Winlow for these vitalized dolls.

Was It Monroe's Doctrine?

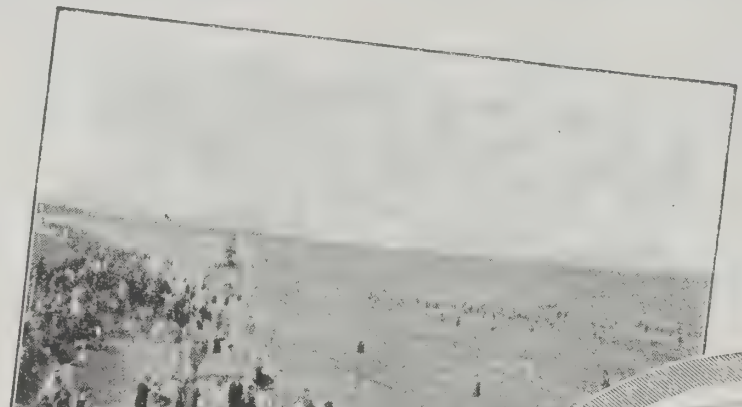
Concluded from page 3

Only a month after Adams' plain talk with Tuyll, the British minister of foreign affairs approached Richard Rush, our minister at London, and advanced the project of an alliance between his country and ours to prevent France "or the other powers of the alliance" from interfering in the affairs of Spanish America. Rush did not decide the question but sought instructions from Washington.

Adams had many real doubts as to Canning's true purpose. For this reason he insisted that if we were to join the British in her proposed alliance the latter must first and at once acknowledge the independence of the South American states. This was to be the test of sincerity. Such a course Adams held to be most properly in order.

To Adams' surprise the President agreed with him. He had won Monroe quite away from the views of Jefferson, Madison and Calhoun and quite away from public opinion. Having gone that far, Adams desired that the President should go further; to remonstrate against the interference of European powers by force with South America; to disclaim interference on our part with Europe; to make an American course and to adhere to it, his sharp point and idea being to *enunciate a principle.* He contended that having recognized the South American republics we could do no less.

President Monroe's first draft of his message as compared with other drafts and with the last shows how deeply John Quincy Adams had worked upon the Presidential mind. The message in finished form was nothing less than Adams' views and ideas with those of the other cabinet members—Calhoun, Wirt and Southard disregarded—in very truth a piece of Adams' literary statesman-like handiwork but to which by reason of his higher station at the time the name of President James Monroe has been solely linked for a century.



Surf bathing is enjoyable the year around at Miami, as the water never gets colder than 72 degrees.

A physical culture enthusiast leads free calisthenic drills daily on the beach. He says the exercise is a sure cure of obesity.

Royal Palm Driveway is reputed to be the finest avenue of royal palms in the world. There are 39 varieties of palm trees that grow in the Miami latitude.

Miami, a Marvel of the Multitudes

Where 40,000 Folk From North Purchase $60,000,000 Worth of Pleasure Every Winter

By GEORGE H. DACY

MIAMI, the resort capital of Florida, holds the American record for rapid growth, having shown a population increase of 440 per cent during the last decade. And, at that, this marvel city has really just begun to grow. Her loyal supporters assert that Miami will have a population of 100,000 when the next census is taken.

Picture a city where in winter the streets are jammed with persons dressed in the lightest garb, come to frolic and play every sport and pastime known to modern fun-lovers, where living accommodations are reserved a year or so in advance, where you may have to sit up in the railroad station all night or beg lodging at the municipal jail if you wait until the last moment and drift into Miami minus hotel reservations. Conjure, if you can, a dream city that offers the most attractive scenery, magnificent drives, superb surf bathing, facilities for polo, golf, archery, house boating, motor boat racing, sea fishing and all other conceivable recreations. Add to the sea a river and innumerable canals. Provide a jungle only a short distance from the main street interwoven with waterways, and you begin to constitute Miami, a city that knows no winter.

Miami is appropriately called the wonder city of the Southland. The term is not one of the enthusiastic publicist nor the boastful "native son." All who visit Miami accord to this municipality ~~every tribute~~ of praise. It is a magic city of fable where once were only shifting sands and limestone rock. The story of Miami and her attainments is a tale of the efficient capitalization of climate. For climate is Miami's most priceless possession. Sunshine, delicious warmth, surf to play in where the water never gets colder than seventy-two degrees, with every asset of a tropical country—these are Miami's natural advantages which return her more than $60,000,000 a year.

The city directory record of the current year estimates Miami's permanent population at fifty thousand. From November to May the number of persons in the city is just about doubled. Practically every room that will house a boarder is occupied. It is the time of the tourist harvest. This does not mean that gouging rates are charged. Only once did Miami make that mistake. Several winters ago, when many of the hotels were new, and the era of profiteering gripped practically all America, visitors were compelled to pay exorbitant prices. They did not return. Far and wide the story was told. That error in judgment cost Miami millions of dollars and it is only the past few seasons that the city has again won back the tourist fraternity. Living expenses in Miami now average what they do in all resort towns. There are two-dollar and twenty-dollar hotels and there are hundreds of homes with reasonable rates.

Miami has opened sixty-five subdivisions of more than 30,000 acres. Climate is a crop that knows no market slump. In Southern California, the prices of orange groves and suburban estates have climbed steadily for the last two decades. Elderly persons who have retired and have enough to keep them in comfort go to California. They are really buying climate. The same condition is rapidly applying to the Miami district. Prices of property are based on the demand. The demand is based on climate. Miami does all her building and repair work in the summer and this past season the city has seen the construction of a half a dozen hotels and more than a score of new apartment buildings, a building program that entailed the expenditure of more than $5,000,000.

The hotel business in Miami is different from that which prevails in most American cities. There are sixty-five bona fide hotels. Eighty-five per cent are open only during the winter season; the others operate all year. Many owners of the resort hotels at Miami also operate summer hotels in the resort centers of New England. These hotel-keepers have reduced their business to a science. They employ the same waiters, attendants, chefs, clerks and managers the year around. During the summer, they run the northern resorts. When these are closed the employes are given a short vacation until it is time to open the hotels in Florida. The same china, silver and culinary utensils serve both hotels, having been shipped from the northern resorts to Florida and reshipped back North in May.

The beautiful Bay of Biscayne, with its matchless tropical waters and its easy access to the Atlantic Ocean, is the utopia of yachtsmen. The harbor of Miami is the gathering place of tars in winter to the number of more than 250 yachts and house boats. Many house boats are miniature floating palaces. They come from ports along the Atlantic Coast traversing inland waterways from Maine to Florida. These winter dodgers—many are millionaires—float down to Florida every winter. Those that do not come in house boats negotiate the trip in yachts. They cruise Floridan, Atlantic, Gulf of Mexico and West Indian waters from their headquarters in the Bay of Biscayne. Many house boats are equipped with gasoline engines. A favorite trip of the house boaters is into the Everglades via the Miami River and Canal.

One of the marvels of Miami is the million-dollar causeway, a twisting driveway wide enough for four motor cars, which connects Miami with Miami Beach and parallels the channel of the Bay of Biscayne—the commercial outlet to the Atlantic. This remarkable boulevard is 3.5 miles long and will be extended and beautified after the navigable channel is deepened. Miami has been practically assured that Uncle Sam will appropriate $1,600,000 to deepen this channel. Government engineers and harbor authorities have surveyed the Bay of Biscayne and have recommended that the harbor be improved.

There is no satisfactory harbor between Jacksonville and Key West, more than 600 miles apart. Nine large vessels recently were wrecked in a storm not far from Miami. They could have made port had there been a harbor deep enough in the Bay of Biscayne.

Southeastern Florida is now served by a single track railway and at the peak of freight movement, congestion often occurs. An improved waterway would aid in correcting this condition. Because the straits of Florida are only forty-five miles wide opposite Miami, a deep harbor would be valuable strategically in warfare. Commerce now available at Miami would justify the deepening of the channel. It is necessary to lower the sea floor seven feet.

With the deepening of the channel, Miami will complete an extensive series of municipal docks sufficient to satisfy the requirements of 105 large ocean-going ships. The program also includes the construction of a viaduct to facilitate the transportation of freight. Miami has set aside $3,000,000 for this purpose.

Miami is built on a bed of solid rock. One who wants to build a rock house has only to quarry on his own lot to obtain building material. When removed the rock is soft but upon exposure rapidly hardens. It makes a satisfactory, permanent building material. It is a limestone rock which, of course, would not be suitable for use in northern cities as alternate freezing and thawing would rapidly disintegrate it. To the northern visitor, it seems odd that so many Miami homes are built without basements. The reasons are self-explanatory.

The barefoot boy thrives the year around in Miami. The weather is so warm during the winter that the schools are not equipped with heating facilities. Most schools are outdoor structures with partially open sides. During school congestion, the Miami Board of Education used regulation circus tents as temporary classrooms.

Miami is a Seminole Indian word which means "Sweet Water" and refers doubtless to the pure water found in the Everglades. Years ago, a huge pile of oyster shells marked what is today the heart of Miami. The Bay of Biscayne teemed with oysters. The Seminoles relished this sea food and collected the shells to pile them into heaps fifteen to eighteen feet high. What is now a leading winter resort city, years ago was famous among the Seminoles as the village of the great shell pile. It was not until 1836, during the early part of the Seminole War, that Uncle Sam first decided that the Bay of Biscayne was worth developing as a potential port and a strategic gateway to the Everglades. He established Fort Dallas there. After the overthrow of Osceola and Johnny Bowlegs, Seminoles, the United States Government maintained a garrison for many years at Fort Dallas. Settlers came in, attracted by the balmy climate and the fertile soil. Lack of adequate transportation held back development and it was not until 1896, when the Florida East Coast Railway was completed, with Miami as its southern terminal, that the city was incorporated.

Above—Miami River is the mouth of the Miami Canal that leads into the fertile agricultural regions of Lake Okechobee. Below—There are more than 125 house boats annually at Miami. A house boat where some of the tourists live.

At that time a large resort hotel was erected. Travelers came, saw and were conquered. In twenty years the population has increased 1,659 per cent. At present the old barracks and ruins of Fort Dallas, the first building constructed in Miami, stand opposite the finest apartment building in the city —just completed—which cost $500,000.

Hialeah, a suburb, has a golf course where Seminole Indians wearing their gay-colored native costumes act as caddies. Hialeah is a part of the famous Bright Ranch of 15,000 acres. James Bright is a Missourian who migrated to Miami eleven years ago and purchased 1,000 acres of Everglades land at the back door of the city. He drained and reclaimed the property. He seeded it to grass and went into the business of producing superior beef cattle. Mr. Bright developed the grazing possibilities of his ranch until it would carry more cattle than any ranch of similar size in the United States.

The growth of Miami is a remarkable tribute to advertising. In 1915, the Miami Chamber of Commerce began a countrywide drive to tell the world about Miami. It has capitalized the fact that it is only forty hours from ice skating to surf bathing with Miami on the sunny southern side. The first year it was a colossal task to raise $2,000 among Miamians to pay expenses. Results won support. A newspaperman was put in charge of the business of circulating facts and figures. The next year $14,000 was forthcoming. The annual appropriation has increased year by year and now amounts to $119,000. The motor roads to Miami for 8,200 miles are posted with permanent Miami advertising signs. They extend as far west as Kansas City and as far north as Bethlehem, New Hampshire. Miami is the best advertised city in Florida.

A short distance from Miami a sugar mill that cost $1,250,000 reduces sugar cane from 5,000 acres. This is but a beginning of a sugar cane belt which one day will rival that of Louisiana and Mississippi. More than 150,000 acres of Everglades country have been drained to yield profitable commercial crops. Dade County, which increased 258 per cent in population and led all counties of the country for the last decade, sells more than $12,000,000 worth of fruits and vegetables every season. Miami is the county seat. The county has 2,500 acres of bearing grapefruit and orange groves whose annual market output is about 7,500 carloads of fruit. In addition there are 8,500 acres of baby groves that will come into bearing in the next four to five years as well as 2,500 acres set out to alligator pears.

Twelve years ago the official appraisal of all Miami real estate aggregated only $1,500,000. Last year it amounted to $64,967,724. This is an astounding gain of approximately 4,000 per cent. The records of the municipal building inspector show that in 1913 only $545,870 was spent for new buildings. Last year there was $6,000,000 in new construction.

It isn't painting the lily—these words of the Miami press agent: "Great is Miami—where you sit and watch at twilight the fronds of the graceful palm latticed against the fading gold of a sun-kissed sky—where sun, moon and stars, at eventide, stage a welcome constituting the glorious galaxy of the firmament—where the whispering breeze springs fresh from the lap of the Caribbean and woos with elusive cadence like a mother's lullaby, where the silver cycle is heaven's lavalier, and the full orbit its glorious pendant."

When the Ku Klux Klan First Flourished

Concluded from page 4

also attendant evils and no man may say if the one offset the other.

For a time, however, robberies ceased, and the lawless became law-abiding. Because of their fear of the supernatural (and they believed the Ku Klux Klan supernatural) the Negroes made more progress in the few months of this period, in the needed lessons of industry, self-control, and respect for the rights of others, and in general good behavior, than they would have made in years but for the Klan or some equally powerful influence. However, it soon became very evident that unless the Klan could be brought under better control than its leaders at this time exercised it would cause greater evils than it suppressed.

Rash, imprudent and bad men were crowding into the Klan and the Grand Cyclops of the Pulaski den sent out a request to all dens to send representatives to meet in Nashville. This was in the spring of 1867. There a plan for reorganization was submitted and adopted. It provided that the territory occupied by the Klan was to be known as the Invisible Empire. This was divided into "realms," which in turn were divided into "dominions," which in their turn were divided into "provinces" and the provinces into "dens." To each of these departments officers were assigned and the duties of each were minutely specified. These officers were:

The Grand Wizard of the Invisible Empire and his ten Genii. The power of this officer was almost autocratic.

The Grand Dragon of the Realm, and his eight Hydras.

The Grand Titan of the Domain and his six Furies.

The Grand Giant of the Province and his four Goblins.

The Grand Cyclops of the Den and his two Night Hawks.

Perhaps the most important accomplishment of this convention was to issue a positive and emphatic statement of the principles of the order, couched in the following words:

> "We recognize our relation to the United States Government; the supremacy of the Constitution; the constitutional laws thereof, and the union of the States thereunder."

This should be proof that no treason was plotted at that meeting. The statement was not intended for public circulation, and not until a quarter of a century later was it given publication. Every man who was a Ku Klux in reality took an oath to support the Constitution of the United States. This Nashville convention also set forth the peculiar objects of its organization as follows:

"(1) To protect the weak, the innocent and the defenseless from the indignities, wrongs and outrages of the lawless, the violent and the brutal; to relieve the injured and the oppressed; to succor the suffering and especially the widows and orphans of Confederate soldiers. (2) To protect and defend the Constitution of the United States and all laws passed in conformity thereto, and to protect the states and the people thereof from all invasion from any source whatever. (3) To aid and assist in the execution of the Constitutional laws, and to protect the people from unlawful seizure, and from trial except by their peers in conformity to the laws of the land."

The order had become serious in good earnest!

The men who founded the Klan and its first members now gave their attention to directing its movements, and in providing restraining measures which would keep it within what they considered to be safe limits. They feared for the excesses which might be committed to the end that the hostility of state and Federal governments might be turned against it, and that it should be suppressed. What the Klan most hoped was that the legislation enacted at the Nashville convention, and its reorganization, would enable it to continue to act the rôle which, in a way, had been forced upon it, the rôle of regulator. "They desired on the one hand to restrain and control their own members; on the other, to correct evils and promote order in society, and to do the latter solely by utilizing for this purpose the means and methods originally employed for amusement. They failed in both directions." —Thus one writer declared in a magazine article that came out in the early 1880's.

"By the reorganization no material change was made in the Klan's methods or operations. Some of the old methods were modified, and some new features were added. The essential features of mystery, secrecy, and grotesqueness were retained and steps were taken with a view of deepening and intensifying the impressions already made upon the public mind. * * * Henceforth the Klan courted publicity as assiduously as it had shunned it formerly. Devices were multiplied to deceive people as to their numbers and to play upon the fears of the superstitious."

For a time after the reorganization of the Klan everything seemed to be going well. Closer organization and stricter official supervision had a restraining effect. Many things seemed to indicate that the future work of the Klan would be wholly good. Then supervision began to relax; Klan rules were disregarded; membership steadily increased among men who could not be controlled. In the spring of 1868 many things were done by members or professed members of the Klan which brought universal criticism on the order. Petition was made for the intervention of the United States Government. The prayer was granted, and the end came rapidly.

Some have questioned why, under the conditions which existed, the Klan did not disband then and there, but it is understood that the members persuaded themselves that there was more reason than ever for the Klan's existence. Matters grew worse and worse until finally the state authorities began to interfere.

Soon thereafter a proclamation was issued by the "Grand Wizard of the Invisible Empire" to his subjects. It recited the legislation directed against the Klan, and stated that the order had in large measure accomplished the objects of its existence. It had provided protection and security to many firesides when robbery and lawlessness of all kinds and descriptions went unrebuked and when all the better elements of society were in constant dread for their persons, property and families. He admitted that, to the regret of the Klan, some of its members had violated positive orders, and others, under the name and disguise of the Klan, had committed acts of violence, for which the Ku Klux had been held responsible. In his right as Grand Wizard and believing it for the best of all, he ordered the Ku Klux Klan dissolved and disbanded. Members were ordered to burn or destroy all regalia of every description, and to desist from assembling or acting as Ku Klux. Nevertheless sentiment in the Klan's favor was so strong that no newspaper in the South dared to publish the proclamation issued by the Grand Wizard. The Ku Klux Klan had, however, no official existence after March, 1869.

What a Nice, Sweet Plum Leviathan Job Was!

Reconditioning of Former German-owned Liner Done Without Regard to Expense; Thomas H. Rossbottom Made American Vessels Pay Way

By a Washingtonian

This is the fifth and last article having to do with conditions in the United States Shipping Board.

HAVING traced the devious course pursued by the Lasker-Lissner-Schlesinger-Freund combination in the Shipping Board, we shall now see what course Mr. Lasker, the "super-business man" from Chicago, was pursuing with regard to the "LeviNathan"—otherwise the *Leviathan*. The *Leviathan* is the ship made famous by Mr. Lasker's "Million-dollar-joy-ride," as the New York *World* described it.

At one time the Shipping Board had a chance to dispose of the *Leviathan,* but William R. Hearst blocked the sale with an injunction.

On December 17, 1919, she was turned over to the International Mercantile Marine Company, a British concern, for care, and this firm received a matter of $15,000 a month for looking after the ship, and was to prepare plans through its naval architect, W. F. Gibbs, for reconditioning the *Leviathan*—after which she was to be sold to the International Mercantile Marine Company.

Through the efforts, largely, of Senator Robert M. LaFollette, of Wisconsin, who exposed the fact that the International Mercantile Marine was a British organization, under secret contract with the British Ministry of Shipping to do nothing which would in any way interfere with or retard the progress of the British Merchant Marine, an investigation was brought about and Lasker was forced to hold what was scheduled to be an extended hearing in New York to determine whether or not the I. M. M. was an American or a British concern.

So a New Plan Is Worked Out

P. A. S. FRANKLIN, head of the I. M. M., was permitted to take the witness stand and make out a very good case for his company—whereupon an attorney representing several Senators, including Senator La Follette, suddenly injected himself into the hearing and in the name of the Senators—who had been invited to attend the hearings by Lasker—demanded the right to cross-question Franklin.

After a hurried consultation between Lasker and his chief counsel, also Shipping Board chief counsel, Elmer Schlesinger, of Chicago, the Senators' attorney was refused the right to cross-question Franklin—and the hearing was without ado adjourned by Mr. Lasker—"to be resumed at a later date." It has never to this day been resumed. But the damage was done. The *Leviathan* could not after that be sold to the British concern—so a new plan had to be devised.

With the United States navy yards barred by Mr. Lasker from participating in the contract under any circumstances, even though the government could have made all the profit which later went to private concerns, amounting to several millions—the International Mercantile Marine agreed to the cancellation of its contract for the reconditioning of the *Leviathan,* and new contracts were planned.

Then Lasker, Lissner, Schlesinger—the whole group—began a systematic campaign on the President of these United States, Congress and the country through speeches, statements to the press—a general propaganda, to arouse sentiment for the reconditioning of the *Leviathan* "as the pride of the government fleet," as Lasker constantly referred to it.

In this propaganda he was assisted by Gibbs Brothers—of whom more later—and a number of others, all of whom appeared before Congressional committees together with Lasker, Lissner, Schlesinger to argue for the reconditioning of the *Leviathan* "as the pride of the government fleet and the American Merchant Marine."

That was the big inducement held alluringly before Congress in the whole program.

Gibbs Bros. Get the Fees

PERMISSION of Congress was received and funds made available for the reconditioning of the *Leviathan* and the contract for the work awarded to the Newport News Shipbuilding & Drydock Company, Homer Ferguson's firm, the bid being for $6,135,575, not including "extras."

Now, what else happens?

Why, although W. F. Gibbs had been the naval architect for the I. M. M., which had been paid hundreds of thousands of dollars for drawing plans for reconditioning the *Leviathan* before the I. M. M. contract was canceled—Mr. Gibbs and his brother form a company known as "Gibbs Bros. Inc." and Mr. Lasker promptly gives them a contract as supervising naval architects to assist Homer Ferguson in reconditioning the *Leviathan* at a lump sum of $1,518,058.37, "for agency fees, supervision, inspection, auditing and accounting, and miscellaneous repairs not covered by contract," so the Shipping Board report for 1922 recites

Of course the Shipping Board had a very large and expensive corps of auditors and accountants costing the government a couple of millions a year—but that force couldn't do the auditing on this *Leviathan* job—"Gibbs Bros. Inc." were given the job of auditing.

And, too, the Shipping Board had a large force of inspectors in its repair department—many with little to do, under Commander Richard D. Gatewood—said to be a most competent man, by the way—but nobody but 'Gibbs Bros. Inc." could furnish the inspectors for the *Leviathan* job.

Gimbel Brothers, a large Jewish firm in New York, had to furnish the plans, the inspection and the equipment for the interior decoration of this palatial liner which was to be "the pride of the government fleet and the American Merchant Marine," so a contract for $646,366.63 was given for looking after the equipment of the steward's department, the furnishings, and so forth.

While all this was going on, a quiet chap by the name of Thomas H. Rossbottom, who had for several years been in charge of the highly successful Panama Railroad Steamship Company—*a one hundred per cent government-owned fleet,* which had been consistently making a profit in operations until the world depression hit shipping—and who, in spite of that, had managed to hold down his losses so far below those of the Shipping Board that comparisons began to be unpleasant for the Shipping Board—was making a success of the United States Lines. This line was the outcome of a scandal which operated under the name of the United States Mail Lines—of which more will be told later.

Lasker drafted Rossbottom into the service of the Shipping Board at $10,000 a year. He couldn't operate, of course, as well as Smull at $35.000, Love at $35,000, so he could be paid only $10,000 a year—but anyway that got him out of the Panama Line so he would no longer prove an embarrassment to the Shipping Board by running ships at so much less cost and at so much greater profit to the government than the Shipping Board could—or at least would do.

But this fellow Rossbottom was a peculiar sort of chap. He seemed to take a pride in operating ships on a businesslike basis, so although Lasker refused to give him a balanced fleet and made him take a lot of old tubs which were worn out, Rossbottom began to make the United States Lines pay.

He shouldn't have done it!

During the joint hearings on the then pending subsidy bill, Mr. Rossbottom testified from his records that the United States Lines—the only Shipping Board line operating directly under the board as a one hundred per cent government operation, remember—had made a net profit of $500,000 under his management to the date of his testimony.

Could Not Get Balanced Fleet

WHEN Representative Ewin L. Davis, of Tennessee, on the following day referred to the fact, Commissioner Meyer Lissner, of the Shipping Board, injected the following into the record:

Mr. Lissner—"Mr. Chairman, in that regard, *I do not think it is just to the Shipping Board to allow the statement that was made and the question that Judge Davis asked the witness in regard to the lines managed by Mr. Rossbottom to stand without explanation. Mr. Rossbottom, it is true, did testify that there was a net of something like $500,000 out of the fleet under his management but he also distinctly stated that he did not include any allowance for insurance, interest, and depreciation."* (The italics are ours.)

Whereupon Representative Davis promptly proceeded to prove that with insurance, interest and depreciation charges included there would still be a net profit.

Here, then, was a peculiar situation. While Lasker, Lissner, Schlesinger, Freund, Farley were trying to tell the world what a success they were making of the Shipping Board, Lissner resented bitterly the fact that the only line actually being operated wholly by the Shipping Board for the government was making money—and a better showing than any of the numerous private and government-agency lines.

Now, what could be the reason for this peculiar inconsistency?

We shall soon see.

Rossbottom had testified that the vessels he had to operate might be called "a horse, and a mule and a jackass team," two of the boats "being originally cargo steamers, and then the passenger accommodations were installed as a sort of an afterthought," were unsuited to the trade, with the result that the operating expense was as much as for a first-class passenger vessel, while the operating revenue was greatly reduced because of lack of accommodations. Four other vessels were described by Rossbottom as "full-fledged jackasses—old German tubs about twenty-one years old." Describing them, Rossbottom said:

"Their operating expenses are enormous, and I cannot get any operating revenue out of them, because the people will not travel in them. The third-class accommodations are not fit for pigs to be stowed in, the ships are old, the steel is crystallizing, and I have all kinds of expenses for repairs on them. There are three steamers I have in mind that if I had them in the United States Lines with the *America* and the *George Washington, I would not take off my hat to anybody."*

Here was a case of where not only did Meyer Lissner, Shipping Board commissioner, resent the fact that Rossbottom was making money out of the only ship lines actually operated by the Shipping Board for the government, but Lasker would not give this line any of the fine ships which he complained were tied up at the docks rusting and decaying because they could make no money, there was no business for them—they couldn't even be given away!

While all this was happening, it must be kept in mind that Lasker had proposed a subsidy measure with direct and indirect aids under which, in actual subsidies, to say nothing of tax exemptions, would have paid the *Leviathan* $1,000,000 annually, and this under the terms of the bill could have been doubled by the board, making $2,000,000 annually, while the indirect aids admitted by Mr. Lasker to far exceed the direct aids, would have paid the *Leviathan* at least as much more—or a total of about $4,000,000 a year—not to mention pay for carrying the mails, returns from immigration revenue of the higher class, and so forth.

This was the bill Lasker persuaded the President to make a paramount party measure, and for the first time in history to call two extra sessions of the same Congress to force it through. Lasker used the whole Shipping Board organization and its funds in the propaganda work, trying to cram the measure down the country's throat.

Were to Buy Leviathan

IT BECAME known through the New York *Tribune* of November 22, 1922, that a syndicate had been formed for certain purposes.

One purpose was to buy from the Shipping Board the profitable and only 100-per-cent government line—the United States Lines.

Another purpose was to buy the *Leviathan,* after she was reconditioned by the Shipping Board.

The syndicate was capitalized at $5,000,000.

Now, who was in this syndicate?

Here's what the *Tribune* said—and the article was never denied:

"The personnel of the syndicate which proposes to buy the United States Lines from the government as a going concern, and to form the largest Atlantic operating company, it was indicated yesterday, includes E. J. McCormack, of Moore & McCormack; W. F. Gibbs, naval architect; William J. Love and J. Barstow Smull, of the Shipping Board. and Homer Ferguson, of the Newport News Shipbuilding & Drydock Company.

"Reports circulated a month ago, when the syndicate's plan was first broached, had it that either Mr. Ferguson, Mr. Gibbs and Mr. Love, or else Mr. McCormack, who is one of the operating directors of the United States Lines, and Mr. Gibbs were the promoters. The names of all five have been linked together in the latest reports, making a strong combination.

". . . . The syndicate's original plan, as *submitted to Chairman Lasker of the Shipping Board* (the italics are ours) contemplated the taking over of the *Leviathan* as well as of the fleet of the United States Lines, and the building of two palatial 1,000-foot liners for the Atlantic passenger trade. Approximately 200,000 tons of shipping would be represented in this deal. The new company is said to plan a nominal capitalization of $5,000,000 with the expectation that further substantial assistance would be received from the government through the Shipping Board!!!"

Let the Reader Judge

WITH $5,000,000 capital these worthy gentlemen were going to do all this, with government subsidy help, two and one-half per cent loans, tonnage bought at a third of its replacement or construction value at the time of sale or even less, on fifteen years' time and a low rate of interest, and take over the profitable United States Lines.

The while McCormack, Ferguson, Smull, Love, Gibbs, were before the Congress with Lasker, Lissner, Schlesinger, Farley—all frantically trying to put through Lasker's subsidy bill.

Does this explain why Lasker wanted the *Leviathan* reconditioned and why it was advised before Congressional committees by Love, Smull, Ferguson, Gibbs?

Does this shed any light on why McCormack, Love, Smull, Gibbs, Ferguson, Lasker, Lissner, Schlesinger, the whole of them appeared day after day before Congress urging the passage of the subsidy bill?

Does this clarify the reason why Thomas H. Rossbottom could only get "a horse, a mule and a jackass team" as boats for the United States Lines?

Does this give any hint as to why Shipping Board Commissioner Meyer Lissner was so aggrieved when it came out in the hearings that the United States Lines were actually making money?

And is Albert D. Lasker the man to continue to advise as to future plans for the American Merchant Marine, while his man "who will carry out my policies," E. P. Farley, is chairman of the board and Meyer Lissner is reappointed for a six-year term as commissioner?

Let the reader judge.

By DR. ARVID REUTERDAHL
President, Ramsey Institute of Technology, St. Paul, Minnesota.

Measuring the Muscular Work Done by the Human Body

OF ALL mechanical devices, the human body is the most complicated, the most perfectly adjusted, and the best adapted to perform the greatest variety of work. In the performance of this multiplicity of work, complex and varied movements are used. These diversified movements are made possible by a framework of bony and cartilaginous levers operated by ingeniously attached muscular groups, whose general structure is the same, but whose forms are adjusted with utmost precision to produce economically the specifically required motions.

At the present time, scientists are studying the human body by employing measuring devices whereby the actual amount of work performed by various members can be measured accurately. The physical unit of work is the *erg* and this unit is defined as a unit of force (the *dyne*) acting through a distance of one centimeter. Devices which graphically represent the work done by a machine are called *ergographs.*

Dr. Martin L. Reymert, the Norwegian scientist, editor of the *Scandinavian Scientific Review,* has devoted much careful study to methods of measuring muscular work. He has developed several ingenious ergographs which are reproduced herewith from his original contribution to the *Scandinavian Scientific Review.*

In England, also, much attention has been devoted to investigations dealing with the human body as a machine. Professor A. V. Hill's lecture entitled "Muscular Exercise," delivered before the Royal Institution and recently published in *Nature,* is an excellent presentation of the principal phases of this new field of scientific research.

Professor Hill points out that muscle, from the microscopic point of view, is composed of a large number of similar thin fibers, about *one-five-hundredth* of an inch in diameter, of a jelly-like substance, running more or less parallel to one another. These fibers are provided with minute blood vessels which supply them with food and oxygen. Dr. Hill classifies muscles as voluntary and involuntary. He states: "In function the muscles differ very widely from one another. The voluntary muscle moves very rapidly, indeed in some small animals the rapidity of its response is almost incredible. The amazing quickness of a little bird jumping from twig to twig is well known, but this is as nothing compared with the speed with which some small insects move their wings, a speed which may be detected from the high-pitched note they emit. The voluntary muscle is very powerful; it is usually 'geared up' to increase the quickness of movement of the limb to which it is attached; if the flexor muscles of the arm of a powerful man were connected directly to a heavy load, they could lift a weight of about half a ton."

The involuntary muscle, according to Hill, moves very slowly. It is an economical device of the highest order when employed to maintain a force for a considerable period of time. The principal work of a muscle is to "contract." During contraction there is no change in the volume of a muscle. The action is like an elastic when the ends are being drawn together.

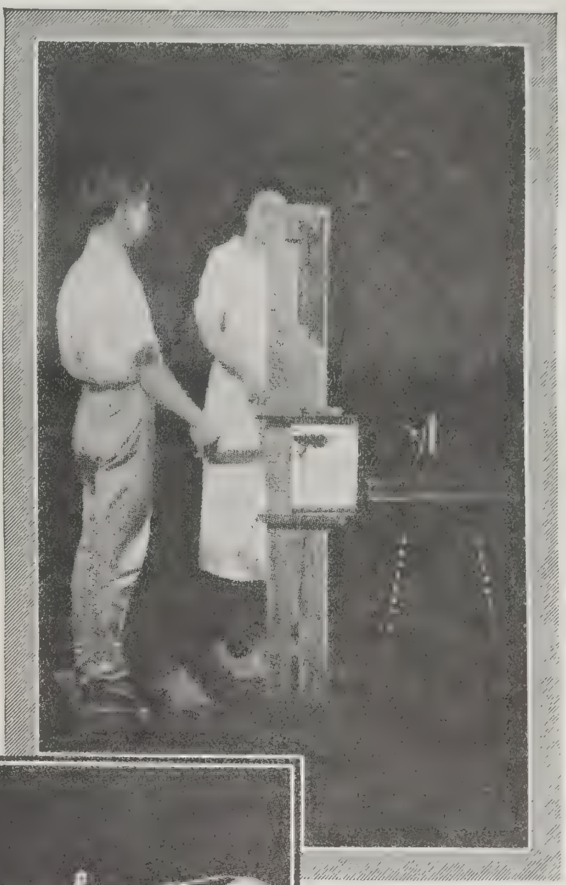
The nervous system controls and co-ordinates the motions of the muscles. In the main this control is reflex and involuntary. Certain motions and activities of the muscles are, however, under voluntary and conscious control. Dr. Hill refers to the *proprioceptive system* as a sensory system which deals mainly "with the position, translation, and rotation of the body, with the stresses and strains in the muscles, with the positions and movements of the limbs."

The study of the phenomenon of fatigue has shown that muscular recovery depends upon the supply of oxygen. The importance of good circulation is evident from this fact because oxygen is conveyed to the muscular fibers by means of circulation. Heat is given out when muscles are in activity. "For every twenty-five foot pounds of energy turned into external mechanical work, at least seventy-five foot pounds are degraded into heat inside the body," states Dr. Hill. Many devices which measure the muscular work done by man are based upon the definite quantities of oxygen required in producing recovery from a previous amount of muscular exertion. A common device for this purpose consists of a large bag (carried on the back) provided with a pipe through which the expired air can be exhaled into the bag. Fresh air is absorbed through a mouthpiece equipped with two valves for inhalation and exhalation. Air samples for any desired period can be taken from the bag. An analysis of the relative quantity of inhaled oxygen and produced carbon dioxide will then determine the amount of energy used by the man during the exercise period.

The oxygen taken in, through "panting," after violent exercise, is used almost entirely in recovery. Professor Hill, in this connection, states: "It is clear that the body can get energy 'on credit,' which it has to repay after the exercise is over, by taking in later an extra amount of oxygen. It acts in the same manner as an accumulator, which can be run down at a very high rate for a short time and recharged afterward." In prolonged exercise a man is limited by his ability to convey oxygen to the muscular system. A strong and perfectly healthy man can take in, by extreme effort, about four quarts of oxygen a minute. From the lungs this oxygen is diffused into the blood and pumped around the body to the muscles. The blood can carry only about twenty per cent of the entire oxygen supply. The importance of the heart efficiency and capacity is evident since the function of the heart is to maintain blood circulation upon which the supply of oxygen depends.

The scientific maintenance of the bodily machine is, today, a problem in measurement of energy intake and output. Dr. Reymert's ergographs were built at the Psychological Institute of the University of Christiania.

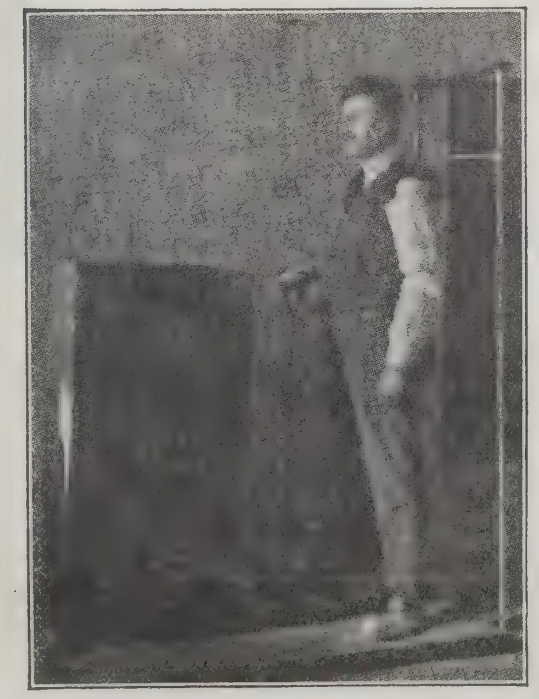
The Reymert ergograph records upon a rotating drum the relative distance through which various weights are lifted. From the data thus recorded the amount of work done can be calculated. The Mosso ergograph was designed to record the work done by the fingers during definite periods of exercise.



Dr. Martin L. Reymert's first model of an ergograph designed to measure scientifically strength and endurance.

Dr. Mosso's ergograph. This apparatus is used to determine the work done by the fingers during a definite exercise period.

Left—Apparatus used to determine the work done from the intake of oxygen and the production of carbon dioxide. Right—Dr. Reymert's latest type of recording ergograph.



A Reymert ergograph used in connection with electrical contact-plates arranged on the shoulders. The slightest displacement of the shoulders causes an electric bell to ring.

CHRONICLER OF THE NEGLECTED TRUTH

How "Shortage Scares" Stimulate Coal Prices

Operators' Press Agents Aided by Newspapers Publish False Reports

By FRED L. HOLMES

DID you ever order your coal on a tip from your newspaper that there was every likelihood of a shortage? And then do you remember how you got slate and dirt with your coal? Did you ever remember to check up the spring following to find there had been no shortage? Then, did you come to a conclusion as to the inspiration of this fancied scare?

Most "shortage scares," whether of coal, of sugar, of oils or meats, are manufactured to stimulate the sale of products at a higher price than would ordinarily obtain. The fear of a lack of food and warmth is an ancestral instinct by which those who have to sell arouse the cupidity of those who have to buy. People will buy an article of prime necessity in excess of their immediate demands and force the price skyrocketing, when shown a menacing "shortage" cloud on the horizon. Through such a fear, housewives are estimated to have paid an extortionate toll of $5,000,000 a week last summer for sugar. Like fears have brought added millions to the packers, coal operators and other monopolies. Newspaper advertising and publicity agents arouse the public to a feverish buying panic; the price advances "with the measure of rapacity"; and the people "submit to the infamy because they are helpless."

Within the past four years, two committees of Congress have gathered facts about the coal industry. Two years ago the clever advertising plan of the coal operators, not only to pay for newspaper advertising matter, but to obtain the publication of inspired news articles and editorials, was unearthed by a Congressional investigation. Then it was discovered that at least one recent coal "shortage scare" was inspired. As a result, the public paid a higher price for a poor quality.

There are many potent facts about the coal industry that have never reached the public. Official investigations and reports have disclosed some startling conditions. Yet, only the meagerest intimation of these revelations has ever been given general publication. The output of the anthracite mines has been curtailed and often strikes have been encouraged to damper the output and keep up the price, was a recent finding of the United States Coal Commission. Important records have been denied government investigators by coal organizations and the secretary of the bituminous group of associated operators admitted under oath before a Congressional committee that the stenographic records of their gatherings were always destroyed after a lawyer's version had been "doctored up" for the official records.

Newspapers Debauched

MOREOVER, the reports of one of these meetings of bituminous operators, captured before reaching the legal counsel, disclosed a jubilant gloat-fest over methods employed to debauch the newspapers by advertising; securing the ultimate publication of poisoned news about coal conditions which did not actually exist. Some of these suppressed facts are here given publication and interpretation.

Coal is a necessity! Without it a large section of the population would freeze every year. It is a natural resource of which there are two sources; anthracite and bituminous. The anthracite supply is under monopoly control; the bituminous supply is nearly so.

Practically all the anthracite coal in the country is located in Pennsylvania. Five counties in the northeastern part of the state produce ninety-five per cent of the output in the United States. The total mining area is less than 500 square miles. The industry employs about 150,000 men and it is estimated that this source of coal supply will last 100 years. As foreign shipments of anthracite are negligible, the market is circled.

With the vanishing wood supply of the nation, the demand for coal has annually increased. A century ago—back in 1820—the amount of anthracite coal mined in a single year would not warm forty families a year now. What fields had then been located were owned and operated by individuals and the output for 1820 is given as 365 tons—one ton for each day of the year.

With the development of the railroads came the gradual acquisition of the fields. Absorption of competitors stifled competition. Extensive production was keeping down the price. To limit, the first "pool" was formed in 1873, followed by the great monopoly consolidation since 1898. Seven railroad companies, dominated by J. P. Morgan and Company and the National City Bank of New York, now control the anthracite industry.

These railroads are:

(1) The Reading Company, which (prior to its recent "dissolution") has controlled roughly one-third of all anthracite reaching the market, and owned or controlled more than one-half of the unmined coal; (2) The Delaware, Lackawanna and Western interests; (3) the Lehigh Valley interests; (4) the Erie interests; (5) the Delaware and Hudson; (6) the Pennsylvania Railroad; and (7) the New York, Ontario and Western.

"It has been established beyond dispute that for a long period of time these seven railroads have marketed considerably more than eighty per cent of the total quantity of anthracite transported," recently declared Senator Robert M. La Follette, chairman of one of the committees on investigation. "It has been shown, moreover, that through ownership and leases of coal lands, these railroads have controlled more than ninety per cent of the anthracite coal remaining unmined in the ground."

Competition has been ended. Out of this monopolistic arrangement a manacle of three links has been forged—control of the output of the mines; control of the avenues of transportation from the mines and control of the prices. Thus is a forced tribute gathered from every home whose hearth is heated by its coal.

There seems abundant evidence that investigations, following one another, have taken the place of some definite official action. Little has been done to check the rising price. These anthracite coal combinations have during the past year been probed by the United States Coal Commission. Its report, rendered on July 5, 1923, showed that within ten years the financial surplus has increased sevenfold. The bane of monopoly is not in the monopoly organization, but in the exorbitant toll it takes from the public. When an unconscionable profit is exacted from the people, monopoly becomes a menace.

"The fundamental fact," declares the official report of the United States Coal Commission of July 5, 1923 (Report on the Anthracite Industry, U. S. Coal Commission to the President and the Congress of the United States, July 5, 1923, page one), "in the anthracite coal problem is that heretofore these limited and exhaustible natural deposits (of anthracite) have been in the absolute private possession of their legal owners, to be developed or withheld at will, to be leased for such royalties as could be exacted, to be transported and distributed at such rates and in such manner as a double-headed railroad and coal combination might find most advantageous from the point of view of private profit, to be sold at such prices as could be maintained by the restriction of output and the elimination of independent competitors, through such means as the maintenance of freight rates burdensome except to those who, owning both mines and railroads, could afford to be indifferent as to whether their revenue came from the one source or the other . . . .

"Whether the peculiar corporate organization of the anthracite industry has been helpful or harmful to the public turns in the last analysis on whether its profits have been reasonable. The fact of an economic concert amounting to combination is established beyond reasonable doubt . . . . The point upon which the public demands explanation is whether or not it has used its monopoly power to extort exorbitant profits from the consumer (Ibid. page 34).

"The net income accounts of the anthracite companies also show an increase. In 1913, the combined net income of eight railroad coal companies that produce fifty-seven per cent of the output was $13,600,000. This statement includes the net earnings from the coal departments of two companies engaged both in mining and transportation but excludes their earning from transportation. In 1920 the net income of the same companies had risen to $33,000,000. In 1921 it was $27,000,000, or twice as great as in 1913. The production of the eight companies during this period showed practically no increase.

"Further evidence that the profits of the anthracite companies are increasing is found in the increase of their surplus accounts. There are five 'railroad' coal companies engaged exclusively in the mining of coal that have been paying dividends in recent years. The total surplus of these five companies rose from $7,000,000 in 1911 to $52,000,000 in 1920. In other words, it increased sevenfold in ten years."

Furthermore, this report shows where the consumer's dollar goes. Anthracite coal sold in Chicago, November, 1922, for $16.72 a ton. "The consumer's dollar," the commission states, "paid for only 120 pounds of coal, and included $.49 as mine price, $.30 as freight and $.21 as dealer's costs and profits." (United States Coal Commission, Report on the Anthracite Industry, page 3.) The average margin of profit for the four years before the war was "$.36" on every ton of coal. In 1917 the margin reached $63; dropped to $.38 in 1918; $.57 in 1919; $.50 in 1920; $.81 in 1921 and for the first three months in 1923, the profit was $1.07, or more than three times the pre-war figure. (Ibid. page 34.)

Daily Report Plan Used

BECAUSE of the limited area of operation, the anthracite coal fields fell on easy prey to monopolistic control. Not so with soft coal. Bituminous deposits are scattered throughout the nation in twenty-eight states. It has been estimated that these bituminous resources are sufficient to supply the American people for 5,000 years. Yet, there is little variance in the charge to the public. Repeatedly, the bituminous operators have denied that they fix prices. Nevertheless, Representative George W. Huddleston, who comes from the heart of the Alabama soft coal district, declared before the Senate Manufactures Committee inquiry: "We have in my territory the Alabama Coal Operators' Association to which practically all the coal operators belong. What their inner workings are I do not know . . . . They have a system whereby daily reports are sent in from each operator and pass through a kind of clearing house, indicating where the order is coming from, the price and other facts, and that information is available to the various operators. That is the purpose of collecting it. A uniformity of price is maintained by the members of that association . . . . They have various sales agents through whom they deal. Now, this Alabama Coal Operators' Association sends a delegate to the National Coal Association." (Publication of production and profits in coal: Hearings before the United States Senate Committee on Manufactures, 1921, v. 2, p. 1929).

Bituminous coal operators have a national organization of their own. It is known as the National Coal Association, with headquarters at Washington. The present directing force of the association is J. D. A. Morrow, formerly of the Federal Trade Commission.

Operators who are members of the association finance it. According to Senator W. M. Calder, New York, who conducted a special investigation for the United States Senate in 1919, "the National Coal Association has been collecting $500,000 a year for the purpose of advising the country on the coal situation; that they paid $100,000 a year for counsel." (Publication of production and profits in coal: hearing before the Committee on Manufacturers, United States Senate, 66th Cong. 3d session on S. 4828, 3 v. 1921, p. 2026.)

More complete details were obtained from the investigation of bituminous coal prices conducted by the Senate Committee on Manufactures.

Shocking were some of the facts that came out in 1921 before the Senate inquiry, which attempted to tear the screen from the National Coal Association. It was conclusively shown that this organization was maintained for propaganda purposes; that it lobbied with members of Congress against legislation that was intended to check the exploitation of the coal operators; that its educational committee was advertising and feeding the newspapers, with "shortage scares, when no shortage existed" (Huddleston: "No there was no shortage. The representation was made that there was a shortage, but there was no shortage.") (Ibid. v. 2, p. 1956); and that in some instances the organization went into politics to defeat or elect friends.

During 1919, the records show that the National Coal Association exchanged "statistical data" on costs of operation, which would tend to unify prices, but that later this practice was discontinued.

The "Get-together" Meetings

BUSINESS transactions of the National Coal Association are shrouded in mystery. The Federal Trade Commission has been impotent to get at the facts. When this Federal agency demanded the books for examination, the National Coal Association refused access. When an attempt was made to examine the books, an injunction was obtained from the Federal courts preventing such intrusion.

Nor is this conduct alone singular for this organization. Testifying before the Senate Committee on Manufactures, Representative Huddleston produced a complete transcript of one of the secret meetings of the association and had it incorporated into the records. It is a most illuminating document showing the methods of operation. Moreover, Congressman Huddleston charged:

"At those meetings they discuss prices, conditions, and many other things, and the inevitable tendency of the discussions is to promote a uniformity both of price and methods of handling labor and all other questions. They promote agreement. (U. S. Senate Committee on Manufactures, Publication of production and profits in coal 1921, v. 2, p. 1929.)

"Now, what I would like the committee to do—and I do not doubt that it has the power—would be to get the National Coal Association to produce to the committee the transcripts of the stenographic reports of their meetings that were held on the dates that I am able to give the committee, and lay them before this committee. They say they ask nothing but a square deal, and that everything is above board. Let them produce the transcripts."

Following this suggestion the vice-president and the secretary of the National Coal Association were placed on the stand and asked to produce the original records. Secretary W. B. Reed said that the original stenographic records of the meetings were destroyed as soon as a copy was edited and passed upon by the attorneys for the organization.

Read Secretary Reed's testimony and form your own judgment: v.2, p. 1934-37).

Question: When was the last meeting of your board of directors held? Answer: In January—I have forgotten the exact date, January 11, I think.

Q. Where? A. In the Waldorf-Astoria Hotel, New York . . . .

Q. What was done with the transcript of the original notes of that meeting of the 15th of January at the Waldorf-Astoria Hotel? A. The custom of the—

Q. What was done with that? A. What was done with it?

Q. Yes, sir. A. We destroyed it. I destroyed it personally.

Q. When? A. Three or four days after the meeting . . . .

Q. Did you refer your minutes to your attorneys to correct before they were transcribed upon your records? A. Yes, sir . . . .

Q. Did you transcribe to the permanent records of your association the notes just exactly as he transcribed them from his shorthand? (This refers to an earlier meeting at Waldorf-Astoria on October 9. A. No; certainly the exact facts of the——

Q. First you edited them, did you? A. First I edited them. I am the secretary and supposed to do it.

Q. Then you transmitted them to your attorney for his revision? A. Yes, sir; exactly . . . .

Q. What was done with the original notes of the stenographer? A. They were destroyed.

Q. When was your meeting before that meeting? A. In July.

Q. Where was that held? A. That meeting was held, I believe, in the Washington Hotel, this city.

Q. What did you do with the records of that meeting? A. The same answer will answer for all records

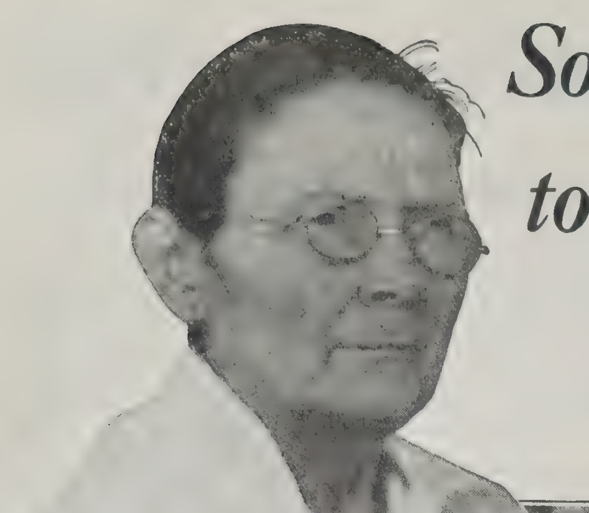
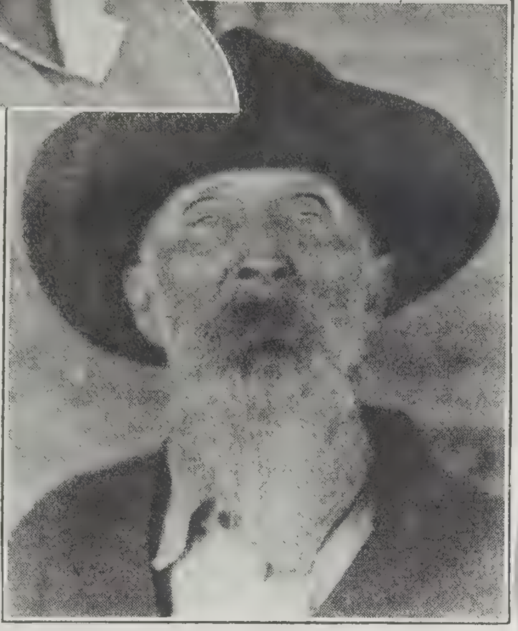
South's Liquid Gold Brings Wealth to Those Who Knew Only Poverty

Millionaires of Oil Fields Often Picturesque Folk Who Have Suffered Their Lives in Grim Poverty

By MAX BENTLEY



"If they had not found a drop of oil on the place I wouldn't have shed a single tear," said Mrs. Jeanette Hughes. "I am not used to wealth and can get along without it in my old age."



Lije Hardin, who leased his place for ten cents an acre and then turned around and made a million on royalties.

HAVE you ever heard of Old Mr. Dolliver, who lived in a certain boom oil field of the mid-continent belt, and died in the midst of his new prosperity from an over-indulgence of bananas? It is a sad story, sadder from the fact of its being true, except that his name was not Dolliver. If you have followed the oil game for ten or a dozen years, the mere mention of him will bring you memories of one of the most colorful and vivid periods in American economic development: the period between 1905 and 1915. If you have not, it will have to be explained to you, the significance of "Clear the road! Here comes Dolliver!"

There was a scattering about the derrick as a big red automobile bumped crazily over the crude wooden bridge and headed for the group, as straight as a rifle bullet. An old gentleman with whiskers was at the wheel. You could see he was utterly bewildered, for he kept shouting "whoa, thar, whoa!" Through every obstruction the big red car made its own road. Disaster appeared certain, yet in some fortuitous way the car came to a panting stop exactly eight inches from the derrick, and Old Mr. Dolliver calmly clambered out and demanded to see the day's pipe line slips showing the well's "run," or, what was more to the point, one-eighth of the well's run, that being his net income.

Any veteran oil man will recognize the picture as truly drawn. "Clear the road! Here comes Dolliver!" used to be a classical saying among the fraternity. One heard it in every field. It meant that the landowner was approaching: to-wit, the farmer whose broad but heretofore unproductive acres had "come oil." One might truly call it a tradition, dating back to the arrival of the boom field mentioned.

The discovery well had been brought in on Old Mr. Dolliver's farm. He was as poor as the traditional church mouse—always had been poor. When the oil spouted over the derrick he ran like a turkey, to the intense amusement of the men on the derrick, who mistook his motive. He ran a mile to the railroad station, called the city, and ordered a limousine—"one of them glass automobiles"—sent out the next day, with a demonstrator.

They arrived next morning. Old Mr. Dolliver proceeded to paint the countryside red. The demonstrator charged twenty dollars a day for his services—he stuck it out for two weeks and then returned to the safety of the city. Old Mr. Dolliver simply could not learn to drive straight. He paid for a half-dozen broken fences and climaxed a hectic career by driving his now battered limousine through a plate glass window, giving voice the while to the familiar "whoa, thar, whoa!". Tiring of the car, he bethought himself with uneasy conscience of Maria's neglected needs, and presented her with a spanking new handle for the old ax, paying five dollars to have it delivered.

Uncle Jeff Flenniken, "slave nigger" and eighty, whose official signature is a crudely scrawled cross.

Old Mr. Dolliver's orgy of spending was not a fantastic isolated case in those days. It came dangerously near being typical of the times. A newly made millionaire in another field of another state leased a race track, bought a string of plugs at thoroughbred prices, and every afternoon treated himself to a private race meet. By way of anti-climax, in still another field of another state one of the newly mades took his wife to the city for an examination by an alienist. He seriously questioned her sanity when she told him, in fear and trembling, that she had subscribed two hundred dollars to the church building fund. The doctor found the dear old lady fully sane, and charged three hundred dollars for the examination.

Instances like these could be multiplied indefinitely if one were inclined to dig up skeletons. Every oil field abounds with the tradition of them. The development of the oil industry is a spectacular chapter in our economic life, and not the least spectacular feature of that development was the frenzy of spending indulged in by the weatherbeaten farmer whose place happened to lay over an oil deposit. It might be well forgotten except for the inherent mental stability of the average tiller of the soil, which rescued the situation in time and put an end to a really perilous phase. The growth of morale among oil men themselves has had its parallel in the return to sanity among those on the outside looking in who, from reasons beyond their control, were drawn into the vortex of it.

Sid Umstead (right) the multi-millionaire in a county of millionaires.

So it was, to satisfy himself that the order changeth, that when an inquiring journalist traveled to the town of Camden, Arkansas, and presented himself at the cottage of Mrs. Jeanette Hughes, he had this pertinent—and impertinent—question to ask:

"How are you all taking it here? How are you spending your new wealth? Are there any Dollivers in this field?"

He, the inquiring journalist, was looking for orgies, and hoping he would not find them.

Mrs. Hughes raised her spectacles over her white, neatly parted hair and settled herself comfortably in the low chair that had seen generations of service. She looked at her interviewer amiably.

"If they had not found a drop of oil on the place I wouldn't have shed a single tear," she said. "I am not used to wealth and can get along without it in my old age. Our people were comfortable, the farm always brought us a living, and while we never had much we never missed it. We had to leave the place, and I don't know but I would rather be there now without all this excitement about oil. All our neighbors feel that way, don't they, Aunt Emma?"

Aunt Emma Jones, eighty-one and bright as a new dollar, nodded as she rocked back and forth.

"Trav Laney was just saying he wished oil never had been found. We were so quiet and comfortable and neighborly, but everybody has had to move," she acquiesced.

It should be said here that Mrs. Hughes owns the farm on Smackover Creek, Arkansas, on which, not so long ago, a drilling crew brought in a tremendous oil well. It flowed fifty or sixty thousand barrels in a single day; before it blew off its flush production the royalties must have reached a simply unheard-of figure.

"It means very little to me," Mrs. Hughes continued. "I don't know what we will do with all that money, but we won't squander it. We and our neighbors are old-time Arkansans, you know, born and raised here, never lived off our farms before, and we are too old to do foolish things. I would not leave this country. We had to give up the farm—the oil was ruining everything—so we came here to Camden and bought this place. Somehow it doesn't seem like home."

It is a modest place of five rooms, on the outskirts of the town. The furniture is worn but serviceable, evidently in the family for years.

Aunt Emma Jones rocked and nodded.

"What you get out of living is what you enjoy," she said shrewdly. "I moved to Smackover Creek in '51 as a child. We bought the place for a dollar an acre. My father is buried there now. He died in '63, and they had to make his coffin in the woods at night. The Yankees were in the country looking for our men in the creek bottoms."

Mrs. Hughes looked away.

"I can't go back," she said, "but one of my neighbors told me a derrick was going up near the graveyard."

"The *graveyard!*"

"Our graveyard. Twenty of our people are sleeping there now by grandpa's side." She spoke with an effort. "Part of the fence has been taken down. My neighbor said the headstones are black with oil from the big well. If only I had thought to ask them not to go inside the fence. I hope they won't."

"I hope so, too," the interviewer said, and Aunt Emma Jones rocked and nodded vehemently.

The family graveyard is the tragedy of the oil field. Heart burnings come with wealth when progress invades the farm. Along Smackover Creek every farm has its graveyard. In some cases the lease of the mineral rights expressly stipulates that the graveyard is hallowed ground. In other cases the lessees voluntarily respect the dead. In a few cases derricks have been erected within graveyards, and graves and headstones trampled down. But, as for the Hughes and Jones burying-ground, the owner of the great well alluded to reassured me with picturesque emphasis.

"Bet your life we'll keep away from *that* place. Tell it to the world!" he said. "That derrick is a good ways off—I saw to that. My men didn't take down that fence. We couldn't keep the oil from spraying everwhichway—she blew out and the wind carried it. Tell Mrs. Hughes not to worry. Tell her I haven't forgotten Merriman."

Merriman!* * * *No one who has followed the oil fields has forgotten Merriman. When the Ranger field was opened, the little Baptist cemetery owned by the Merriman church and occupied by its dead was found to lay squarely over the proved oil-bearing lime of the region. Efforts were made to buy it. Fantastic sums were offered. In those early boom days, before the oil game settled down, unheard-of sums were paid for leases.

The Baptist board steadfastly declined to sell. Tradition has it that at a heated session of the board with a group of bargainers the chairman arose and with gnarled and nervous fingers combed his long beard.

"This is final," he said deliberately. "Gentlemen, you can go to hell. Merriman is not for sale."

"Merriman is not for sale" became a byword in the

(Concluded on page 15)

The English Mind and the Closed Garden Gate

Just Why American Temperament Finds Cousin's a Bit Trying

By GAIUS GLENN ATKINS

THE real business of life in England is carried on behind the garden gate and the minor fact that the garden gate may be two yards from the street, screened by geraniums, or two miles from the high road, screened by oaks as old as Magna Charta, is only a detail. The means by which an Englishman secures for himself and his that privacy which he considers necessary to the right conduct of life constitute the immediate foreground of an English landscape. The contacts which the casual visitor establishes in England, barring the shops and the streets and the objects starred in Baedeker, are mostly with hedges and brick walls. The devices for seclusion are generally standardized but there are endless variations. A semi-detached villa—which is in plain American one-half a double house—is screened by a hedge and divided from the next half by another hedge. Its front windows command a plot from three to five yards square, as full of flowers as it will hold; its rear windows command the garden—usually surrounded by a brick wall high enough not to see over, with a graveled walk around a grass plot, the walls flower-bordered, the turf shaven and the ensemble furnished with canvas reclining chairs. You enter by a gate and there is a name on the gate. The British passion for naming and not numbering his house is comparable only with the American passion for naming a box of a lakeside cottage, and there is the same wealth of imaginative resource in finding utterly unsuitable names. But all the same, the fact that a man lives at Ravenswood on Manor Road instead of No. 237 East Main street lets in light on the English mind—Ravenswood may be the small half of a plain house, but it is an establishment and not a number.

A detached villa repeats the scheme on a wider scale. The garden is more ample, the front screen more dense. If the house can be set back sixty feet the walk curves, the planting becomes a labyrinth and you look over the gate—if you can—into windings which hide the front door. Suburban places grow more pretentious. The street screen begins with three feet of brick wall topped by a solid board fence, head high, backed by a clipped hedge a foot higher with trees behind the hedge. The labyrinth becomes a masterpiece of indirection and the solid front gates shut Ferndale, or Oakdene, or Grangehurst finally from a curious world. Dignity and resource build a furlong—or two—of brick wall, crown it with broken glass bottles set in cement and the result is final and arresting. At the top of the scale the grounds have become a park with a ring fence, a lodge gate, an avenue of oak or beech a mile or two miles long, and somewhere at the hidden heart of it all a great house which may have begun as a castle or an abbey—but even back of that great house itself there is the walled or terraced garden. The whole vast business of English life, social, commercial, or imperial, is a device to maintain, enrich and guard that garden. English law protects, English sentiment hallows it; it is at once the symbol and creation of the essential English nature.

Naturally the Englishman emerges from the garden. He comes out for work or for trade, or to visit his neighbor's garden, or for the House of Commons or the Lords as he is born or chosen, or to administer the Empire, or to discover the South Pole, or to shoot grouse in Scotland or big game in Africa, or to man a battle line which reached half around the world, or to send his younger sons to new lands or to die in far and lonely places. But he goes back when the day's work is done, or Parliament rises, or the war is over and if he dies in far lands, I think his ghost comes back.

Smashing Up of Old Order

HE IS also, just now, being sold out—or selling himself out. The scheme of land taxation and inheritance taxes begun by Lloyd George stiffly enough and greatly increased by the war is changing the English order as it has hardly been changed since Doomsday Book. Great estates are being broken up; old places coming upon the market and the garden gate is open and the garden itself is on the auction block. There are more "For Sale" signs—though not commonly worded so bluntly as that—in England today than in all her previous history. The back page of the *Times,* where estates and places are offered for sale, is a pictured revelation of the dignity, luxury and habit of English home life at the top and the smashing way in which the old order is being broken up. In the issue of September 3, 1923, estates comprising a total of 10,538 acres are offered for sale, generally by auction. One estate contains more than 6,000 acres, not to speak of city and suburban places and furnishings in whose lists old furniture, old rugs and old china are as common as automobiles in Detroit. A wandering American announcing himself as a prospective purchaser could secure entrance to domestic sanctuaries untouched by the invader since William the Conqueror. The garden gate is open and historic England is, sadly enough, moving out. One wonders if there is purchasing power enough in the Empire to take these offerings. As far as the smaller farms are being taken in free hold by their tenants the change is both socially and economically sound. Where old places are being taken by war profiteers it means the vulgarization of English society. But deeper still, the whole process is the gradual seeping away of the land capital of England in taxes, doles and pensions. Here it becomes an aspect of a social revolution, bloodlessly carried through, upon which only the historian of the future can pass judgment.

But all this is a long aside. The garden is still the heart of England and upon whatever errand the Englishman leaves, essentially he takes the garden wall with him. He lives behind reserves. It is this personal reserve rather than the brick or hedge that baffles the American. He accepts the hedge and wall as interesting and finally irritating elements in the landscape, without always considering how those are spiritual deposits secreted as a mollusk secretes its shell to protect the organism within. The Englishman even takes to protective coloring when he comes out. He has his heather mixtures for the Scottish moors, and his gray for his gray climate. He makes only one exception, his spats. Why he thinks that white spats lend a final touch of distinction equally to the creation of a Bond Street tailor and a four-pound-and-ten city-made lounge suit is a matter whose true inwardness the alien may never reach. But you can see the spats farther than you can see the wearer. There is also the silk hat worn with a short coat, a hopeless problem. (But the "topper" is yielding. It still holds the region about the Bank and Stock Exchange, the last stronghold of a sartorially lost cause.)

English and French Contrast

THE imponderable garden wall which he took even to the battle front makes casual contact hard and is the key to a deal of misunderstanding. There is a fine but tremendously real distinction between being let alone—which is keeping the garden gate shut—when you want to stay outside and being shut out when you want to go in. The average Englishman does not handle this situation deftly. Nor, it must be confessed, does the average American help him. There is reticence, immemorial habit, sometimes hauteur—which is French for reserve heightened by pride—and occasionally "swank"—which is English for impressing other people with your importance even when you are not important—on one side and impatience and readiness to take offense when none is intended and inability to understand on the other. There are profound differences between the English and the American temperament which result often enough in irritations and misunderstandings on both sides. It is essentially a matter of national psychology. At any rate, here is the place where the Englishman manages to go wrong with the American oftener than anywhere else. And it is, after all, only an affair of the garden gate. The French do better, for they have a kind of front garden in which to meet the alien and they do it with a courtesy which at once charms and deceives.

As a matter of fact, the French back garden—and there is a French back garden—is so nearly impenetrable that the American, with all his temperamental affinity for the French, never gets into it at all. He comes and goes through France and never dreams how deftly he has been shut out of the very inwardness of French life—meanwhile blessing French courtesy and banning—a discreet word—English coldness. But the courtesy masks a baffling aloofness—and the coldness is only the garden gate.

You really know English folk as they come from behind the wall—ponderable or imponderable—or else as they let you in. And what is the inwardness of the man you meet in either instance? He comes out, it has been said, among other things, for trade. That word is a key to one whole side of English contact. An American is in "business," an Englishman in "trade." Trade is the economic foundation of the England of today. No matter if the old English caste system built upon another foundation—a landholding gentry—bears hard on the tradesman, England lives or dies by her trade. Trade is a matter of give and take. You cannot trade without profit, but you cannot trade—and keep trading—if the man you deal with does not make his profit. The Englishman looks after his own profit shrewdly—no denying that; where the American cuts prices to make business the Englishman adds six pence to make a gain, or he adds a shilling to the twenty and charges a "guinea." There are no guineas. The mint does not coin them nor the bank issue them. They are his shilling's profit in the pound. The extra sixpence and the extra shilling have made England's wealth. But he trades honestly. He is proud of his goods and his house—the age of his house is one of his standard forms of advertisement. You may trust his word. And he knows the value of a contented customer. He does not meet competition quickly or adroitly, simply because he expects his customer to stay by him.

He follows and guards his trade to the world's end. He estimates the value of a safe and orderly world in terms of trade. Here is the key to his attitude toward Russia or Germany today. A Russia in revolution and a Germany in bankruptcy mean disorganized trade and that means a million unemployed in the streets of his cities. So he forgets—or better, ignores—yesterday's bitter fighting and tries to make a going concern of ruined states, to get trade going again, for his trade is his life. He fights for it if need be, treats for it if he can, shapes his policies to continue and safeguard it. But always, in spite of his insistence upon making and keeping it a going concern, he sees, for this is the heart of trade, his customer's point of view. Why not? Trade is a mutual enterprise. Here is a matter which goes deep. He trades in politics and diplomacy. He will give a value for a value. He will compromise—a mutual agreement in trade. He will exchange opinions. You cannot understand English economics unless you understand the fundamental life-and-death matter of English trade. You cannot understand the English mind unless you think of it as a trading mind. But take care not to take the word in too narrow a sense. You must broaden it to include the whole give and take of life.

He comes out to go to church—though not always. If he owns a parish and a park he is likely to set his parish church in a corner of the park with a convenient back gate in the churchyard, through which he may pass to his own particular box pew and, with his feet often literally on the graves of his ancestors, worship God in an unembarrassing privacy of intercourse between himself and his Maker. He keeps Sunday in a way which delights a visiting parson and gives a Frenchman who is so fortunate as to spend a week-end in London "black butterflies"—which is French for melancholia. His middle class is soundly religious and his percentage for church attendance tops ours. Somewhere beneath the decorous surface of his national life there must be a seamy side—but, barring his public houses with their crowds of men and women drinking curious combinations of malt and brewed liquors and drinking them endlessly (a judicial Englishman told me he thought a working family spent twenty per cent of its income for drink)—the seamy side is marvelously well hidden. He goes to church reverently, listens well and sings better. Neither his preachers nor his public speakers generally are given to oratory. The English public speaker at his best is seemingly conversational, but his movement is solid and what he says reads surprisingly well. He manages at his best to make literature out of public discourse.

He comes out of his garden to administer his village, his borough—or his empire. And he does it well. He is orderly and loves order. He has an immense regard for law, so much so that he makes laws sparingly enough. The average American State Legislature passes more laws in a single session than Parliament. A far-reaching law is an event in English legislation. It has thereafter a date—like the Battle of Hastings. He makes old laws do by a slow solidity of changing judicial decision and yet his laws probably reflect his public opinion more elastically and completely than American law reflects American public opinion. His laws grow; they are not made. And they are obeyed; he begins by obeying them himself and then seeing that others do it. He has the hand of steel in the velvet glove. His policemen go unarmed—save for a short truncheon which they use in extremity—but they handle his crowds as a sheep dog handles sheep, and check his traffic with an uplifted hand. He does well with the polyglot, many-colored, many-customed and religioned elements of his empire. He has had his failures, but he is, in his tongue-tied and precedent-hampered way, an immensely capable administrator. He does not cut a knot well; but he is a master hand at untangling it, give him time enough.

Poling on the Thames

HE GOES out for sport; he is a born sportsman. The old habits of the land make him a hunter, his climate and his temper make him a lover of competitive games. He is a better amateur than professional and the distinction between the two is strongly drawn. At "Lords"—his classic London Cricket ground—the "gentlemen" come out one door, the professionals another—but they play together. He loves leisurely motion, but he keeps it up. He pushes a flat-bottom boat with a pole along the winding course of a river, famed in song and story for half a millennium and ten yards wide and three feet deep for all that, by the hour. On bank holiday I estimated 100,000 people in and on and by the Thames in ten miles. His cricket would be prescribed by a nerve specialist as a rest cure and end by giving the average American nervous prostration. But it's a real game for all that. He plays it from the cradle up and watches it, with intervals for luncheon and tea and going home at night, literally for days. He is a good loser and respects you when you beat him at his own game—one of the guaranteed ways to get through the garden gate.

He does not greatly commercialize his sport. Cricket matches draw great summer crowds and the reports of them fill columns in the English press, reported with a careful solidity contrasting strongly with the slangy baseball reporting of the American press, and football—developed professionally vastly beyond the American habit—draws immense crowds. But admissions are cheap and salaries probably low. The sport takes precedence of finance. The English universities have no stadiums. The whole really great matter of school and university athletics is carried on with the least possible machinery and expense and probably with a far greater participation of English youth generally than in America—a most wholesome situation. English sport is not so highly specialized as ours. Our trained athletes, professional or amateur, usually beat the English but a hundred Englishmen who have lived an outdoor life, young and middle-aged and taken at random, will beat a like number of Americans—chosen in the same fashion—at golf, tennis, rowing, shooting or walking.

He is a strange mixture of the provincial and the globe trotter. I have heard of London cockneys who discovered Trafalgar Square; I knew an Oxford trained rector who had not been to London—he lives sixty miles out—for a decade; I heard casual laborers discuss New Zealand or Australia, and met in a third-class compartment plain men who had built telegraph lines in remotest India. The far-flung entanglements of trade and administration give to the more intelligent English a a world-wide interest. The garden gate is also a part of this entanglement and tends to complicate it—you cannot always easily get an empire and its interests in or

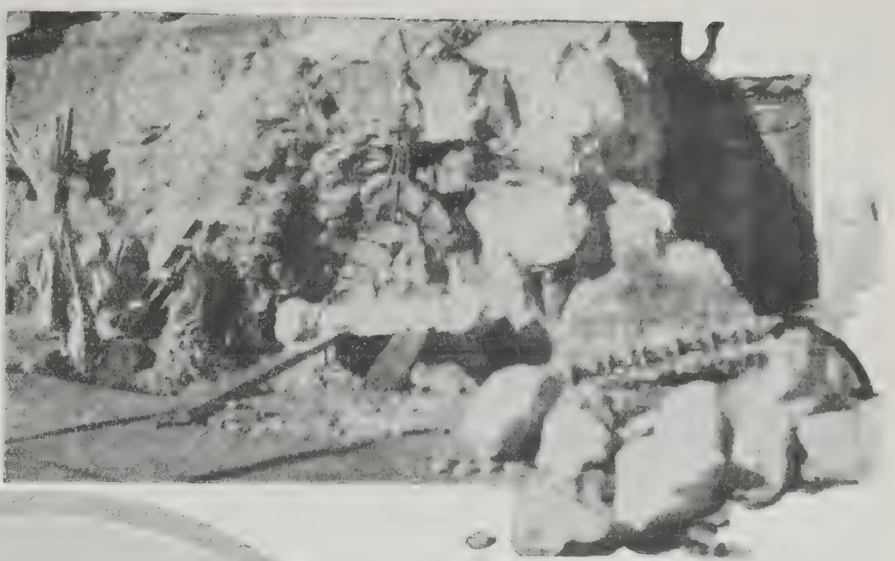
Dead Bones That Tell Story of a Continent

Fossils Uncovered in Utah Would Have Made Clubs for a Hercules

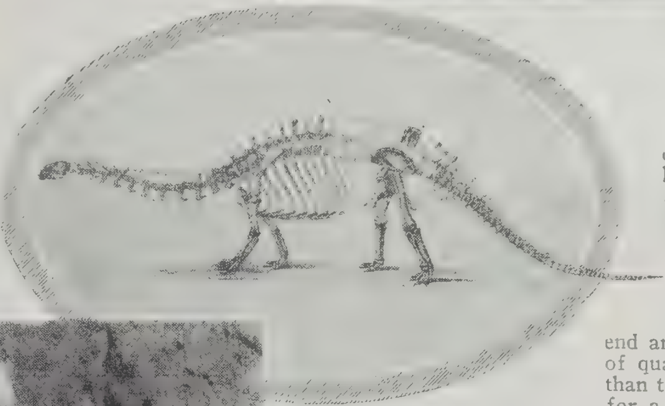
By WYMAN SMITH



Removing one of the thigh bones from the quarry. A few vertebrae lay at the right.

IN THE Uinta Mountains of Utah, fifty miles from the Colorado line, is a collection of bones that tells the story of a continent. Although they were once buried in a cemetery ten thousand feet below the surface of the earth, now those bones are all uncovered—that's the rest of the story.

Today, eight to twelve million years after those bones were filled with blood and covered with flesh, the place where they are found is tucked into the side of the mountains more than one hundred and fifty miles from a railroad. When we left the little town of Duschene to follow the winding road along the Duschene River, we turned around one slate-colored hill after another, dipped down through vermilion-walled gulches, and skirted the buttes and table-lands of sandstone and shale for a hundred miles. At places we came upon irrigated sections, but wherever we went the dry, flat-topped ridges of the table-lands appeared along the horizon. Then at the end of a hundred miles we came to a signboard set at a crossroads where poplars grew, and it was that sign which indicated, "Dinosaur National Monument," while beneath the words we found the painting of a skeleton which once belonged to one of those "terrible reptiles." The road became worse at once, approached closer to the shale bad lands, turned about a great bend in the broad, gently flowing Green River, and eventually brought us closer to a hurly-burly heap of coral and blue velvet rocks we had first seen nearly thirty miles away.



Brontosaurus, one of the sixty-foot reptiles taken from the rocks of dinosaur quarries.

Showing white against the rock, the two huge fossils were strange ornaments.

From a distance that tumbled heap of pink rocks looked like a fairy castle, and now that we approached to within a few miles of it, it became even more enchanting and inviting. But we lost sight of it for a moment when we angled up a little gulch between the high hills and stopped beneath a cottonwood tree and near an assortment of boxes which seemed to be filled with mummies. Aside from that we were in a funnel of hills, gray and buff in color and of such loose, uncertain material we wondered if they would not be moved bodily by a cloudburst. At only two places did there seem to be solid material and those were where two ridges of harder material than the rest rose vertically among the shales to run across the hills from horizon to horizon, like spines set edgewise on the hill backs.

Southward the Green River winds through its sagebrush bottoms where only a few willows show green against its dark ribbon.

Near one of the crates was a mummy which had apparently been broken open. I stopped to examine it more closely only to discover that underneath a layer of plaster of Paris was an affair which resembled a bone, but was incased in a sort of soft limestone rock. The bone-like substance seemed to have been burned, for it was of a rusty color, as marble is where iron rust has dripped down it. The other crates had other queer-looking mummies, each wrapped to protect and hold its secret and then numbered.

I did not stop longer then, for at that moment one of my companions called out that a trail led up the hill to the dinosaur quarry, and we followed up the dry ashy path. The material on which we walked was also soft, more like ashes which have been soaked in water and then dried, than like ordinary earth. All about were vari-colored rocks until it seemed as though we were walking along the surface of a rainbow where only a few piñon pines and cedar brushes reminded us that we were on solid earth. Around the hill the ashy path led, and then, making a sharp turn at one of those hard limestone layers we had noticed, stopped abruptly in the face of a quarry which was like any rock quarry might have been. But this quarry was different; it was a hundred miles from nowhere and either the men who had worked it were crazy or they found in it some particularly valuable rocks.

We looked around and for a minute or two saw nothing unusual. At the edge of the slope was a little dump cart which had been used to carry off debris; in the face of the rock wall was a wooden door with a smokestack coming from the door casing, around us were the colored rocks, sandstones and shales, and near by was a dump of cracked rocks which had been discarded. Whoever had been working here had deserted the place.

"Look at that—just look at it!" The outburst came from one of my companions, and I turned to look in the direction indicated by a pointing finger.

What I saw made me shiver as though I had been suddenly thrust into a grave, for there, about ten feet above us and incased in the rock layer, were two enormous whitish bones. They would have made good clubs for a Hercules; one was more than four feet long and at its narrowest point was nearly four inches in diameter, while the other was somewhat flat and about two feet long. Although they looked like bones, close examination convinced us that they were rocks. Somewhat reassured, we began to scramble about the quarry in quest of the unexplored.

We found any number of bone-rocks, or fossils. There were ribs, slender and rather delicate; great pelvic bones which alone must have weighed several hundred pounds; vertebrae large and heavy showing that the creature had possessed a staunch and sturdy backbone; then we also found various smaller bones, some broken off, some with only an end showing, but all held firmly between the teeth of the rock.

At first we counted the bones but soon found so many that we decided an entire zoo must have been buried here at one time; the rocks were full of fossils, and although the layer was less than forty feet thick, it was set up on end and would provide work for an unlimited amount of quarrying. Even at that spot the quarry was more than two hundred feet long, and less than half the rock for a depth of forty feet had been chiseled and sliced off—that rock contained the bones now being arranged by the Smithsonian Institution, and various other museums, who make a business of bone-sorting.

"Those are bones, certainly, but how did they get there, and what sort of a disturbance went on around this country to jumble up these rocks in such a manner," we asked and the scientist climbed a somewhat higher ridge that lay toward the south where we gathered and listened to his explanation, the story of creation and of a cemetery.

"Those bones belonged to dinosaurs," he began, "almost the biggest living things which have ever moved on the surface of the earth or in the seas. According to Richard Lull, paleontologist, 'in size the dinosaurs ranged from that of a house cat to a length and bulk exceeded only by the greater of modern whales—upward of ninety feet long and forty tons in weight. In habitat they were as varied as in size, for some were light of foot and bi-pedal while others were quadrupeds of unwieldy bulk, some armored, others armorless, some endowed with horns, or with talons and terrible teeth, others whose only means of defence lay in their huge size and inaccessible habitat. They were carnivorous and herbivorous, some of the latter having very defective dentition which made mastication of the food impossible, while others were provided with a dental battery of marvelous detail and perfection.'

"But don't hurry," our friend was continuing, "let's go back in the history of the world for a few million years until we can picture the sort of region this was when those creatures were alive. At that time there were no mountains; neither was it a time when perpetual 'darkness lay upon the face of the waters.' All this region about here was swamp land bordering various inland seas or lakes of fresh water. In those swamps palm trees and various cone-bearing trees grew in a dense forest under conditions similar to those of the Florida Everglades. The air was accordingly hot and filled with moisture, rains were frequent, and undoubtedly a good many of these dinosaurs waddled and plowed through the mud like the rhinoceros. Undoubtedly had we been here the noise one of them made in the shallow water would have sent us up a tree in terror—think of a twenty to forty-ton creature like that plowing along, cropping herbage from the shore or reaching down into the water with its long neck to pull up the vegetation which grew there.

The Green River flows along the base of Dinosaur National Monument and through the coral canyon of Split Mountain shown at the right.

"For they did have long necks something like kangaroo and they moved on two legs also, somewhat like that animal, although they didn't jump around. Those necks helped them to feed and you can imagine it took considerable herbage to keep one dinosaur satisfied. Now we don't know how they came here, or why there are so many bones at this particular spot. Robert Yard says, 'the extraordinary massing of fossil remains at this point suggests that floods may have swept these dinosaurs from a large area and lodged their bodies here where they were covered with sands! But it is possible that this spot was merely a favorite feeding ground.' One case might have been a great tidal wave which overwhelmed them, for they breathed air, or some other great cataclysm may have thrown them here of which we know nothing. For although this is a great quarry, the dinosaurs lived in Europe, the Americas, Africa, Madagascar, Australia, and have been found

Beauty Enthralls as Honduras Shore Looms

The Purple of Mountains, Turquoise of the Sea and Green of Tropics Reign

By S. M. FINN

The fort at La Ceiba, Honduras.

The plaza in La Ceiba.

A strip of the coast showing Alhambra cocoanut garden.

PURPLE mountains, a turquoise sea, beating surf and a long white beach, low white buildings, palms and glorious warmth; that is the first impression gained of Spanish Honduras as the ship draws slowly up to the wharf at the town of La Ceiba. It is a sight long to be remembered and one most people have only read about in books. Coming from the North, one looks with awe upon this tropical beauty, and longs to be ashore and have the experience of basking in the shade of cocoanut palms while soft music from the patio of some Spanish villa is wafted to you on the breeze.

One can have such beautiful ideas before going ashore but then the great disillusion. Dark-skinned natives crowd the wharf waiting to go to work loading bananas on our boat. Large, unwieldy machines upon the wharf are used for lowering bananas into the hold of the boat. Once off the ship, we start walking in toward shore and meet a snorting little locomotive which comes dashing out, dragging behind it a dozen cars loaded with the honorable banana, mainstay of this country of Honduras. You step briskly aside to avoid being bumped into those turquoise depths near by where man-eating sharks wait to dine upon just such people as you.

Once ashore, what appeared to be a scene of clean white buildings and beautiful streets resolves itself into squalid shacks of stone and wood, and dusty ill-kept streets swarming with children, and mangy fleabitten dogs, packs of them. To be sure, there are some very fine buildings, most of them belonging to exporting and importing companies or the prosperous liquor saloon keepers, but these are few and far between.

You discover the natives to be a diversified lot and find that they are made up of Carib Negroes, Indians, Mexicans, Spaniards, Frenchmen and members of all of the Central American countries. The majority of these natives are not full-blooded in any instance and most of them have Negro blood flowing in their veins.

Among other individuals hanging about the streets are natives attired in what by vast imagination may be conceived to be a uniform; and you learn that these are members of the Honduranian army. The average enlisted man wears a sort of undershirt and a pair of pants; he goes barefooted and often bareheaded, although the more dandified wear straw hats. While on duty they are armed with what appears to be an ancient Civil War rifle, though very often with nothing but a machete or large knife which they become very proficient in handling. It is no exaggeration to say that it is safer to face a native who is armed with a rifle than one who is armed with a machete, for while he might not hit you in a hundred shots at fifteen paces with a rifle, he could carve you into most fanciful designs with his machete before you knew what was going on. The army is mostly used at the time of elections. The soldiers go around feeling everybody's pockets to see if they are carrying any firearms or knives which might be used to influence the course of the election. I am reminded of one affair in which the army itself was used to carry an election.

Two men were running for governor of the district. They got together and promised each other solemnly that they would do nothing unseemly to bring about the fall of the other. The day before the election one of the candidates forgot his promise and placed posters all over town telling the world what a crook and grafter his opponent was. Of course it was too late for the other man to retaliate in print. The day of the election, however, there were armed men at every voting booth instructing the natives how to vote. Needless to say that, in this instance, the sword was mightier than the pen.

A few hot days in the confines of the town and you are quite ready to fare farther afield. The fruit company starts a rickety train about six o'clock in the morning and we are soon bumping along through the country. On one side impenetrable jungles are broken now and then by banana plantations or cattle ranches. On the other side groves of cocoanut palms run for miles and extend from the track down to the sea not far away. The train never leaves the coast for more than a few miles; a short distance from the coast there are only jungles and mountains. Now and then, as the train passes through a Carib village, we catch a glimpse of squatty mud shacks thatched with palm leaves.

I remember going with a few friends to a place called Sambo Creek. We had heard that there was a hot spring supplied by the water issuing from the crater of an old volcano and we decided to go there for the purpose of taking a hot bath—a luxury in that country. Alighting from the train, we started inland toward the mountains and were soon in the midst of the jungle. A little path led us to the top of the small mountain where the volcano crater is located. Three-quarters of an hour of climbing and we came to a tiny secluded nook where the waters from the hot spring came tumbling down over a forty-foot falls on one side, disappearing on the opposite side over another falls, after having passed through a sort of natural pool which we at once decided to make our bathtub.

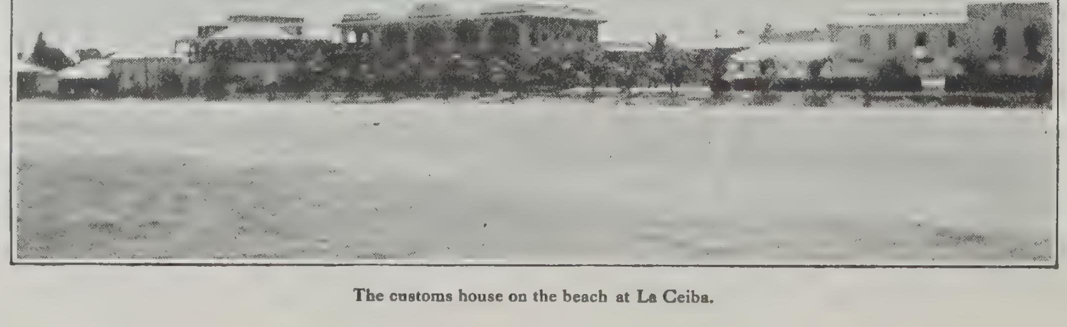
As we had brought our lunches, we decided that it would be a novel idea to climb to the source of the hot water and boil some eggs. Leaving most of our clothes at the bottom we started to climb. It was a hazardous route because we had to jump from rock to rock back and forth across the hot stream, and creep along narrow ledges of rock which lined the gorge, hanging to vines and limbs of trees as we moved; in short, employing every means of ape-like antic to proceed. It was not a great distance to the top but it took us fully twenty minutes to make the climb. Once there, we discovered the source of the water, which came bubbling and spouting out of an old crater about five feet in diameter and descended over a series of cascades. The water was so hot that it required only two minutes to boil an egg. Steam rose in clouds and a perfectly good Turkish bath was possible by merely sitting in these clouds of steam. An hour passed with bathing and lunch and then we started back. The descent is always harder than the ascent. I was progressing very well and had just remarked that I must surely be a true illustration of the Darwinian theory, when a most disastrous event occurred. In jumping from one rock to another at the very head of a thirty-foot falls, my foot slipped on some moss and I went over. It could not have taken a full second to drop the thirty feet, but in that time I thought of the boiling water beneath and had a vivid picture of myself being hauled out looking like a lobster. I landed in a pool of hot water about three feet deep and without stopping for possible broken limbs or scalded skin, I moved faster than I had ever moved before. I was out inside of five seconds and then and only then did I stop to take inventory of my injuries, which fortunately were not so serious as they might have been. I escaped scalding because a cold stream, flowing into the boiling water just above the scene of my fall, had served to cool the water to a temperature approximately equal to a very hot tub at home. The rest of the descent was performed without further accident.

All around us except where the water flowed in and out, huge trees rose to a height of one hundred to two hundred feet. From the depths of the jungles came weird humming noises caused by great beetles. Now and then a bird chirped but never sang. Great blue butterflies came flitting over the lower falls and disappeared above us. We were in perfect seclusion from the rest of the world.

The jungles of Honduras abound in all kinds of wild animals. Deer are numerous as the dogs of the street and everybody in the town who has a yard around his house usually has a couple of deer for pets. There are lions and tigers; not the larger African tigers but smaller and very attractive when young. Baboons and monkeys abound in the banana plantations and are apparently in no fear of people who are constantly passing by. Thousands of brightly colored parrots fly out to the islands off the coast in the morning and come back at sunset. Insects are a great pest in this country and a source of many fevers prevalent there. Ticks are everywhere, afflicting humans and animals alike. Mosquitoes, red-bugs and sand fleas also worry the dwellers. So it will be readily understood that because of these many pests, Honduras is not the most healthful nor the most enjoyable place in the world.

Among the sports of the country, bullfighting is popular. Every year, during the season, bullfighters come down from Mexico to furnish amusement for the people. Gambling of all kinds is an indispensable element of the popular pastimes. Swimming is not popular although there are the best facilities.

The banana is the main source of revenue. Oranges, grapefruit and cocoanuts are shipped in small quantities and sugar is becoming of more importance. Rubber has been produced but not in great quantities. Nevertheless, Honduras may be considered a potential rubber producer of some importance. Practically anything may be grown in Honduras.



The customs house on the beach at La Ceiba.

Mr. Ford's Page

WHAT *is* the issue? Is there an issue at all? What is it that the people want? Do they know what they want? Or is there only a vague childlike faith that a miracle will occur, or a miracle-man appear to save them? There seems to be a difference between the people's knowledge and the people's hope. All minds are more or less uncertain what will emerge from the pot which is now boiling so turbulently. Something will come out of it, without doubt, but prophets who can tell what it is are few and not in public favor.

Owing to the way our national life is organized we have acquired the habit of regarding all great questions as if they came in four-year or eight-year cycles, that is, as if the progressive life of the people accommodated itself to the periods of a Presidential election. When the election year comes round, we look for the issue, as when harvest time comes round, we look for the crop. But apparently crops are in the system of nature, while elections are not. Political principles rise and ripen quite regardless of times and seasons, parties and platforms.

ISSUES are born, not invented. They come in their own time, not every election year. A nation does not escape the burden of a bad course by making a new issue; the choice made and the situation created must be lived out, its lesson must be learned, and then a new Issue—a new chance to choose—may arise. We are now in the period of a former choice and the bad situation created by it; but have we learned our lesson? As a nation are we any wiser concerning ourselves and the influences which move us than we were before? Have we been awakened or only disturbed a little in our sleep? If so, we are not ready for a new Issue, a new choice. Until we awake we shall continue to be victims of "Government by Talk," which is the worst misgovernment of all.

But though principles and issues are quite independent of parties, being able to create the party which is to be the vehicle of their entrance into human affairs, the parties are not so independent of principles and issues, they cannot create or invent these by order. Thus every election time sees a mad hunt for principles and issues upon which to fight the campaign, and consternation seizes the contestants when they realize that these have not been provided. It is worth while to study political machines in those years when party necessity and the ripening of the people's mind do not coincide.

With most of the great issues having passed out of the political field into the economic field (to the great detriment of the people in some instances), with the coming of smaller caliber officials whose chief concern is office and not the problems of statesmanship, the importance of issues has dwindled to that of mere slogans whose value is not their inherent truth and worth but their vote-stimulating power. There is more genuine judgment based on merit shown in the cattle show of the average county fair, than is shown in the average selection of political officials. At the county fair you have the facts upon which to form a judgment; in the average election you have not.

So, as the country approaches the election without a definite, overshadowing, all-compelling issue, what does it mean? It means two things: first, that the progressive life of the people has not yet given full birth to the next great issue; and, second, that we are in for another game of small slogans.

For Issues are born, not invented. They come in their own time, not every fourth year.

Why, says someone, this would indicate that we do not manage our own affairs! If we cannot raise our issues when we wish, then we are at the mercy of circumstance!

The point is worth an attempt at clearing up. We are at the mercy of circumstance when we have created the circumstance, and until the circumstance wears out. That constitutes the seriousness and sincerity of life. We have a choice, we have a hand in the making of events, but the choice once made must be lived out, the event once invoked must be lived out. The choice and the event are not final by any means, but while they have their little time of life they are irremovable. That is, the only way to do away with what we have created is to live it away. Life is both the creator and the solvent.

Now, twenty-five years ago in this country there was a chance to make a choice. The nation made its choice. It does not yet appear to the nation that it really made a choice, it seems that it just lived along normally and permitted the usual things to happen. But when a series of causes are set in motion, they continue to move until their force is used up, unless deflected by a stronger set of influences. And in our national life there has been no stronger set of influences to stop or turn what we set in motion. We have lived a spineless sort of life, believed what we read in the newspapers or what office-seekers have told us, permitted Jew ideas to rule our thinking—and then we wonder why things are as they are!

We are in the period now when influences we set in motion long ago are working themselves out, and we had better realize that. We had better wake up to the fact that we are alive, and that we have been napping and dreaming. "Life is real, life is earnest," says Longfellow. But we don't believe it very seriously. "Things are not what they seem," says the same American poet, yet we go along thinking that things are exactly what they seem. Because of that delusion we are where we are. We are looking for new things to begin before we have learned the lesson of the old things that are now wearing themselves out.

So that it is very clear that issues are not at the mercy of elections, though elections may sometimes be at the mercy of issues. The problem for all people just now seems to be the meaning of the absence of issues. What is there to do, if there be no Issue? What does the absence of issues mean? All these questions arise out of our very faulty habit of making issues subordinate to political ambition.

When election time comes round and no Issue appears, what course should we take? We should consider first of all that the Government is only the business administration of the people's affairs, and not a national debating society. We should begin to ingrain the idea in our minds that Government is not Talk but administration. A Government does not need an Issue any more than a policeman or a postman does. Government is put there under certain orders to do certain things, to run the people's front office, and upon its success or failure in that task it is to be judged.

Too much time and wealth have been wasted in Talk to take the popular mind off this task and turn it to matters that have nothing to do with the case. "Government by Talk," someone has called it. Well, you cannot govern by talk any more than you can make automobiles by talk. Government is a matter of *doing something*—not merely signing appointments of postmasters or anxiously seeing that nothing occurs which shall "hurt the party"; government is fulfilling the clearly laid down task of establishing the liberties of the people, physical, economic, political and moral, and removing from the national system all that hinders the freest play of the best energies of all our people. And everyone knows that our national system is choked and clogged by alien substances which are today and every day preventing our people living the kind of life which our situation here entitles them to live.

It will be a rather humiliating day when the Issue arises whether a government ought to perform its job or not. That seems to be an Issue dimly foreshadowed for the future. Make a list of the government duties that have been farmed out among private interests, and see how that Issue is even now upon us. Trace the sources of power and see whether they emanate from Washington, or whether they originate elsewhere and only appear through Washington for transmission to the people.

It seems almost trivial to say that the best Government is that which performs the governmental duties which are intrusted to it. But a view of government failures in this respect will show that it is not so trivial.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Public Speech in a Decline

SOMETIMES the public is confused between "talking" and "talked about." Some men are so much talked about that the impression goes abroad that they are forever talking. On the contrary, the most talked-about men are usually men who have other jobs besides talking. It is not so much about what men say that people talk as about what men do. Actions always speak louder than words, and have greater carrying power.

Something like this may be necessary as a reminder, now that the Congress of the United States is about to reassemble. Most of our greatly talked-of men have been members of that body, but the most talked-of have not been always the most talkative.

For instance, Thomas Jefferson says:

> "I served with General Washington in the legislature of Virginia before the Revolution and, during it, with Dr. Franklin in Congress. I never heard either of them speak ten minutes at a time, nor to any but the main point, which was to decide the question. They laid their shoulders to the great points, knowing that the little ones would follow of themselves."

It seems that always when there is work to be done, the talkers are at a disadvantage before the doers. Even in times when oratory had its uses, as it did during the formative period of American institutions, the actual work of construction was done by men whose productiveness did not consist only in speechmaking. Oratory is useful when a multitude of minds are to be fused in understanding loyalty to a single great principle. But perhaps no form of human activity so persistently tends to become an end in itself. Orators tend to become showmen and talkativeness becomes an industry.

In this country a spirit of impatience now greets all talkers. Until one arises with something vital to say (which can be said briefly) the country will not turn its head to listen. We have been talked to death. Not one Congressional speech in a hundred is read—less than that number is listened to. In short, a wholesome dread and distrust of talk has taken possession of the people.

The blueprint will replace the manuscript and direct counsel will replace the oration. At a time when certain political liberties were being secured, speechmaking had its place. But with the securing for humanity of its economic liberties, the engineer type of statesman is a necessity—and the engineer accomplishes nothing by oratory.

Pro-Jewish Propaganda

IT IS frankly amusing to observe the seepage of pro-Jewish propaganda through the daily press. Not only do the Jews insist that the newspapers print the most brazen inaccuracies as news, but they also insist that the editors appear to swallow it by writing editorials about it. Thus there has come a whole crop of editorials recently along three lines—first, that the Jews did not kill the Czar; second, that the Jewish military record eclipsed all others; third, that the Jews are great farmers.

As to the first, every government now has proof not only that the Czar and his family were killed upon express orders of the Jews but that the actual deed was wrought upon the man, his invalid son, his wife and daughters by a Jew. As to the second, we are still waiting patiently for the record which the American Jewish Committee so long ago promised. As to the third, it is true that "farmers" like the notorious Samuel Untermyer and others of his ilk have very large estates. You can see them for miles along the lordly Hudson; you can see them in the aristocratic environs of any rich Jewish center—great estates, hundreds of acres each, farmed by Christian "help."

The newspapers have apparently felt it was safest of all to editorialize upon the point that the Jews are becoming farmers. The editorials doubtless are a reflection of the thought that it would be a good thing for multitudes of Jews to do, and also a reflection of good will toward them in doing it. But the fact is not as stated; every effort to turn the Jew to the soil has failed, or where farming communities have been established they have been kept alive only by a large expenditure of money and a constant supply of Jews who leave the land as soon as their poverty permits. It is rather alarming to see how whole agricultural districts are falling into the hands of Jewish commission men who are becoming the go-betweens for farmer and citizen. This is a condition which has led to trouble in every country, and should be avoided here.

However, it is not to discuss such problems that these lines are written. It is only to call attention to the enlarging wedge of pro-Jewish propaganda of an entirely questionable type which is steadily being inserted into American newspapers. Editors should change the system which makes them mere hoppers into which all sorts of "copy" can be thrust. That system only makes them accessories to the wholesale delusion of the American reader.

Money in Circulation

IN ITS issue of November 19, the Charleston (West Virginia) *Gazette* carries a leading editorial which merits attention. From official figures it demonstrates that while the amount of gold held in the United States has increased by a billion and a half since the election in 1920, the money in circulation has decreased by a billion of dollars. Inasmuch as the reserve requirements for paper money are but forty per cent in gold, and the amount of gold held here would secure a paper issue of more than ten billions, the *Gazette* points out that the four billions that are issued is less than half what might be available to business under the law.

This estimate of four billions in circulation is too generous, since much of the lawful money (paper) it estimates to be in circulation is held in reserve along with gold, and the actual circulation is not more than half the reputed circulation, which would make it not more than two billions at the outside. How much of this is passing from hand to hand is impossible to state, but it is certain that of bills of the denominations greater than one hundred dollars, very few are ever seen in ordinary business.

The *Gazette* places the blame where it belongs, however, when it states that the shortage is caused by the Federal Reserve System, since the banks in that system carry a reserve of more than ninety per cent of the paper outstanding against them.

It must be remembered that the United States has no gold of its own. The fund held for redemption of its own notes is borrowed gold, and in case of excessive redemption more gold must be borrowed to keep the fund up to the amount prescribed by law. About a billion and a half of gold aside from this fund is in the Treasury, but is represented "in circulation" by an equal aggregate of gold certificates, or "yellowbacks." These notes are only in nominal circulation for they have been segregated by the Federal Reserve System and are held as a part of the legal reserve.

Out of a total of actual circulation aggregating say two billions, must come the counter money of banks and business houses, cash in hand of industrial concerns, and pocket money for individuals, including the hoardings of stocking-bank depositors.

To the warnings of the interested financiers against inflation of the currency volume, the *Gazette's* argument is a complete answer, since there is no danger of an excessive issue of currency under the law. Even now, while reserves in this country are more than ninety per cent, those of England are but twenty. France is lower still, her gold reserve being about fifteen per cent. To those who criticize France for the elimination of any part of her debt through the impairment of the value of money, that is, by inflating it, terming the act dishonest, it may be replied that the policy in the United States, which is to enhance the value of money by deflation, is just as dishonest, and that an equitable basis of values can never be attained where a commodity measure exists, nor where a privileged group can dictate the fiscal policy of the nation.

Canada and Rum-running

IT IS not believed that the conclusion of the "wet" press that Canada will give "the cold stare" to United States proposals to stop rum-running across the border is the true conclusion. Doubtless in Canada, as everywhere else, the political class now in control of the governments is "wet." And official Canada is probably just as wet as officialdom anywhere else is.

But British sentiment is quite another thing. The past summer has witnessed a revival of decency abroad to this extent, that the United States has the right to make experiment of a liquorless country without hindrance from without. Heretofore it was quite the joke in England and Scotland to assist in the "over-sea rum-running trade." A member of Parliament was one of the strongest directors of this modern form of blockade-running. His exposure in the public prints brought home to Britishers the essential indecency of the whole attitude. This summer notable travelers from abroad—men who like their toddy and their ale—have been frank to say that the United States is a better country with the saloon out of it, and while they do not go sled-length for the absolute prohibition of liquor they do say that England and Scotland would be the better for it if the public house were abolished there also. One notable Britisher, who made no bones about his predilection for a little liquor now and then, said that nevertheless it was a fact that the children of the poorest classes in America wore shoes, which could not be said for the children of the patrons of England's public houses.

Then, there was also the willing accession of the British Government, not only to the sealing up of liquor stocks aboard British ships in American waters, and to the right of search and seizure if this agreement were violated, but also to that most unprecedented agreement to the extension of the international three-mile limit at sea, to a twelve-mile limit. That is, British officials have agreed that British vessels suspected of liquor running may be searched as far as twelve miles from the American coast. This notable concession is in the spirit of fair play. If Great Britain prohibited the export of firearms into her territory, it would be a distinctly unfriendly act on the part of any nation which should attempt to smuggle in firearms. That is precisely the way enlightened British sentiment feels about rum-running into the United States.

The whole case has been clearly stated by the London *Daily Telegraph*:

> "The American authorities, rightly or wrongly, hold that they are engaged in a great human experiment for the betterment of the nation which merits the patient and sympathetic consideration of every civilized country, and while they do not ask other countries to follow their example in prohibition regulations, they do suggest most courteously that no obstacle be placed in their way, and they invite British co-operation to the extent of suppressing that organized smuggling upon which the lawbreakers here rely very largely for facilities to break the American law."

That's fair play. The officials of the Canadian conference will be badly deceived if for one moment they think that the United States is looking for a loophole to evade all the implications of constitutional prohibition. Canadian public sentiment cannot be less fair than that expressed abroad. British fair play is, or ought to be, the same throughout all the King's dominions. And, in this international phase of the prohibition question, it is solely a matter of fair play.

The Answer Is Here

A SINCERE desire on the part of those officials charged with enforcing prohibition to be faithful to their duty, and co-operation of the several branches of the Federal Government involved, soon would end the humidity of the cities. And it is in the cities that the Eighteenth Amendment to the Constitution is being set at naught.

An inquiry by this publication reveals that more than eighty per cent of the still-operators, blind-piggers, rum-runners and other violators of the Volstead Law who are drawn into the net in New York, Chicago, Detroit and Cleveland, are alien-born and that of this number nearly all are without American citizenship.

Revocation of the privileges of American citizenship to those who have acquired it, and deportation automatically following conviction of those without citizenship would end the problem for all time.

Of course, it won't be done, but it is, we maintain, the one effective method to be pursued.

Putnam Park Tells of Heroes' Privations

Memorial to Revolutionary Leader Marks New England Valley Forge

By GEORGE S. BRYAN

THE almost mythical figure of Washington and that vivid picture of bloody footprints in the snow have combined to make of Valley Forge a nation's treasured and familiar shrine. At Valley Forge a Pennsylvania state commission has in the last quarter-century developed a fine memorial park, adorned with commemorative works of art and containing the Washington headquarters—a charming stone house now thoroughly restored. Amid the wooded hills of Western Connecticut is another memorial of similar character and kindred historical interest, marking a like scene of privation and suffering in the American cause. Though begun in 1887 and largely completed by 1890, it is no such place of pilgrimage as is Valley Forge Park, which was not undertaken until 1893. In fact, Putnam Park—or Putnam Camp, as it is sometimes called—is but little known outside Connecticut.

Putnam Park was, of course, named in honor of Major-General Israel Putnam—the same "Old Put" who descended into the wolf-den, still shown at Pomfret, to dispatch a wolf at close quarters, and who left his plow in the furrow when news came of Lexington and Concord. Statues at his home town of Brooklyn, Connecticut (by Gerhardt), and at Hartford (by Ward), celebrate the bluff, idolized old warrior; but not more truly, perhaps, than does Putnam Park. This camp ground is one of three occupied during the winter of 1778-79 by troops of the right wing of the Continental Army, with "Old Put" in command. The park at present comprises a little more than one hundred acres, and it lies along the western rim of a narrow, sheltered valley that even in modern days seems somewhat remote when it must still be reached by poor dirt roads. State highway extension between Bethel and Bridgeport has recently rendered it more accessible.

The main entrance to Putnam Park, with a view of the monument.

It has been suggested that the sites of the Redding camps may have been recommended by none other than Colonel Aaron Burr, who had often visited his uncle, Deacon Stephen Burr, at Redding Center, and who was hence undoubtedly well acquainted with the nature of the countryside. Thither, at all events, from the Highlands of the Hudson, a three days' march, went most of the Continental right wing—unpaid, unprovisioned, unkempt, and with no prospects of either pay, food, or clothes. With the exception of two corps, these troops appear to have been chiefly New Hampshire and Connecticut militia. By the middle of November, they were all in camp. Their barracks, like those at Valley Forge in the previous winter, consisted of log huts. These huts were built in the general style of the frontier cabin, which remained the only original architectural style invented in this country by the white man until the day of the "skyscraper." They averaged about sixteen feet long by twelve feet wide, and had at one end a rudely laid chimney of field-stone. Each was designed to accommodate either eight officers or twelve enlisted men. The huts were arranged in two (or, more rarely, four) rows, and must have had the appearance of a most primitive settlement.

Scarcely had the troops arrived, when winter set in with a vengeance. It was a season destined long to be referred to by "oldest inhabitants." Snow lay so deep that fences were out of sight and roads entirely obliterated. The cold was intense almost beyond precedent. There was much distress among the wretchedly clad soldiers—and that they were wretchedly clad is evidenced by the fact that Putnam had written to Washington, months before, that one regiment not only had no blankets but was to a great extent without breeches, overalls, shirts, shoes, and stockings. At the instance of Governor Trumbull (Washington's "Brother Jonathan"), the General Assembly of Connecticut had ordained that each Connecticut town must supply, for use by Putnam's army, one pair of stockings, one hunting-shirt, two linen shirts, two pairs of overalls, a half-dozen pairs of blankets, and a dozen pairs of good shoes. It was not a large requisition, yet many of the towns were so reduced that they could not meet it. Redding, the very township in which the camps were situated, felt compelled to petition the Assembly for relief. At the town of Danbury, some five miles distant, had been kept military stores—a large quantity for those times, including 400 barrels of beef; 3,000 barrels of pork; 2,000 bushels of grain; and more than 1,000 barrels of flour; besides 1,600 tents and considerable amounts of wine, rum, and rice. No doubt these things would have been welcomed by Putnam's men; but Danbury had been burned by the enemy in April, 1777, and all the stores had unluckily gone up in flames.

Captain Daniel Livermore, of the 3rd New Hampshire, made entry in his diary that it was "a very disagreeable winter"; which, to say the least, must have been putting it mildly. Affairs were made additionally pleasant by the shooting of a deserter and the hanging of a spy—a Loyalist caught within the Continental lines. Furthermore, Putnam saw to it that every Sunday detachments of such men as were presentable in public were marched to Redding Center to the Congregational Church, where they listened to the long and (let us hope) instructive sermons of Pastor Bartlett. The flagging spirits of the army sought cheer in song; and patriotic lyrics were specially written by two young poets who happened to be on hand. One of these versifiers was David Humphreys, at that time a captain on Putnam's staff and later aide to Washington and American minister to Spain; the other, Joel Barlow, who, having just been graduated from Yale, was spending the winter in Redding. Barlow afterward wrote that amusing mock-heroic poem, "The Hasty Pudding." He died abroad while acting as American plenipotentiary at the court of Napoleon.

Along toward the middle of the winter, two Connecticut brigades made an attempt at mutiny; their idea being to march to Hartford and present their manifold grievances to the Assembly, then in session there. "Old Put," who had got wind of the plan, delivered an effective harangue, and the insurrection crumbled. The winter did finally wear to an end; and the troops began to prepare for the next campaign. By the beginning of June, 1779, the last of them had gone.

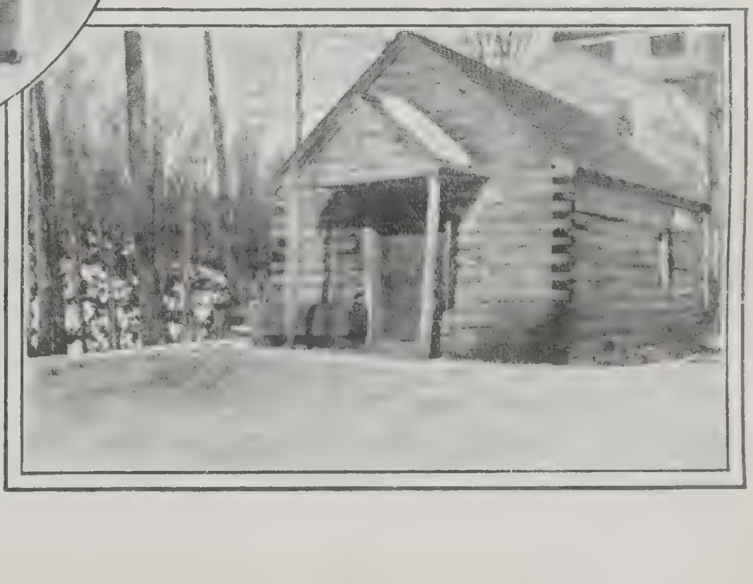
That summer, it is said, apple trees were set out where barracks had been and where now runs the drive called "Putnam Avenue." If this be authentic, the two or three trees that still linger there by the aid of the tree-surgon and produce an occasional apple have been standing in that location for nearly one hundred and forty-four years. In time, agriculture was resumed on part of the area now included within the park, and harvests of flax, maize, and rye were grown. But huts and chimneys were carted away; so that of the encampment's original structures, nothing remains save the ruins of fireplaces along "Putnam Avenue" and scattered elsewhere about the grounds. One of the springs whence drinking-water was obtained may yet be seen.

Certain relics that were picked up about the place have been transferred to a museum building where they are exhibited with various other objects belonging to the period. Three reproductions of original structures have been built—one of the guardhouse, one of a storehouse, and one of a typical hut. A simple boulder, duly inscribed, has been placed in memory of unknown soldiers buried within the inclosure. Facing the main entrance, stands an obelisk monument, forty-two feet high, designed by John W. Stimson. The shaft of this monument is of quarry-faced ashler, the granite having been procured from a rock-mass that occupied the same site; and the general effect of rugged plainness is quite appropriate.

Of other features of the Park, some may seem to the visitor scarcely relevant. For example, flanking the main entrance are what were intended to be reproductions of frontier blockhouses. These have no pertinence in connection with this memorial camp; and they unfortunately create a wrong impression, inasmuch as their lower stories are of masoned stone, whereas the typical American blockhouse was, of course, entirely of logs.

The park is more truly interesting when seen, not in the regular season for visitors, but on a winter's day when cold and snow make it easier to realize the conditions that Putnam's men endured. On such a day the writer made his way through the grounds, with only a few stray juncos about, and stood within the cheerless huts where men once suffered and endured. Old Deerfield, in Massachusetts, still brings very close to us the rigors of the colonial frontier; and in a similar way does Putnam Park bring close to us those darker days of the Revolution, and the "free and iron men" who persevered.

Putnam's headquarters were not at the camp, but about two miles away, on Umpawaug Hill, in a farmhouse long since torn down. A bridle used by him, and presented by him to Joel Barlow, is preserved in the museum at the park; but there would seem to be no other personal relic of the brave, whole-souled commander who helped to make historic this New England "Valley Forge."



Above—A memorial to unknown dead.

Right—Reproduction of the guardhouse at the camp.

Yiddish Drama Jumps From East Side to Broadway

Three Stars' Acting Reveals There Is Much for English-speaking Artists to Learn in the Saying of Their Lines

By PETER SCHUYLER

BY FAR the most significant and interesting event of the current theatrical season in New York has been the appearance of the Yiddish drama on Broadway. It has taken more than three years to make the jump from the lower East Side, which has hitherto been the particular stamping ground of the Yiddish dramatic muse, but the objective has been reached at last. The playhouse which was formerly known as the "Nora Bayes Theater" has been rechristened, if that phrase is permissible under the circumstances, and is now "Thomashefsky's Broadway Yiddish Theater."

Across the street from the Forty-Fourth street side of the Hotel Astor, surrounded by showhouses in which English alone is spoken, and in the very viscera of the amusement Tenderloin, the three best known and most able actors of the Yiddish stage are playing in Yiddish a farcical comedy with musical interruptions, "The Three Little Business Men." There, nightly, Boris Thomashefsky, Rudolph Schildkraut, and Ludwig Satz are entertaining not only those who speak and understand the language used by the actors but also hundreds of others to whom the play and its environment are objects of curiosity. Incidentally the trio is reading a sadly needed lecture to English-speaking actors of prominence on the subject of first-class acting. Broadway has never seen a native production in which three actors, of the standing of the Yiddish stars, have given a performance as completely free from personal jealousy and as filled with balance, dignity, and effectiveness as is "The Three Little Business Men."

Yiddish Losing Fight

UNTIL Morris Schwartz started his Jewish Art Theater in Madison Square Garden about three years ago, Yiddish playhouses in New York were confined to three well-established areas: Harlem; that section of Manhattan bounded by Fourteenth street, the East River, the Bowery, and Broadway; and the quarter in Brooklyn known as "Brownsville." Here were grouped the theaters in which were given dramatic performances and a now almost extinct type of show best described as "Yiddish vaudeville." Some still remain. The Yiddish dramatic stage, while waging a steadily losing fight for existence, has, in the face of changing conditions, managed to hang on. On the other hand, the vaudeville theaters where the turns were given by actors speaking Yiddish have dwindled to two, the Mount Morris on Fifth Avenue and One Hundred and Sixteenth street and The Grand on Grand street. In the latter place half of the show is given by English-speaking turns.

Of the large number of playhouses presenting dramatic pieces in Yiddish on the East Side a few years ago there are now left only the National, Lenox, Gebel's, Prospect, Irving Place and Second Avenue. Successive seasons see a change in the theater where the plays are given but the number of playhouses where they are given remains either the same or decreases. The reasons for the decay in both types of Yiddish theater will be touched on further along.

Yiddish Actors Superior

MR. SCHWARTZ, who launched the Jewish Art Theater on its precarious career, did more than break away from the tradition that plays in Yiddish must be produced in a proscribed area in order to be supported. He did not seek to create merely a wider market of patronage for what he was trying to do by presenting his productions where they could be easily seen by both East Side and West Side, by uptown and downtown, by Yid and by Goy. What was far more important, he broke away from the stereotyped method of production and presentation to which the other Yiddish theaters clung and which they still stubbornly refuse to abandon. He brought into the notice of the great theatergoing mass and the knowledge of uptown managers, an actor who, one season after his appearance at the Jewish Art Theater in "Green Fields," created a sensation on the English-speaking stage, and who today is one of its most spectacular figures, Jacob Ben Ami. He destroyed the sleek conceit of the English-speaking actors by uncovering Yiddish players who were their superiors in almost every technical phase of the acting art. He shamed the producers of Yiddish plays by making his presentations as modern as they could be and in more than one instance outdistanced Broadway managers by the simple beauty and effectiveness of his work. He did not make a fortune out of any of his efforts but he offered an inestimable service to the Yiddish stage if those who control it had vision enough to know it. He showed that a play in Yiddish could be done just as artistically and played just as well as anything in the English-speaking theater. He put the lovers of real acting under obligations to him by demonstrating that the strictly unionized Jewish theater could produce artists whose theatrical capabilities, generally speaking, were much better than those of their English-speaking fellows. For with all its defects, which are many and serious, the Yiddish theater can still boast that when a man or woman reaches prominence in it the reason lies in his or her ability and nothing else.

Some Very Good Acting

APPARENTLY Mr. Thomashefsky, who is the inspiration of the further advance up Broadway, is not going to be burdened by any such serious purpose as was Mr. Schwartz. If appearances go for anything he seems to have figured out that there are in the heart of New York enough persons who speak his tongue to keep going, at a profit, a theater where they can hear it. Time will tell whether he is right. At any rate he is not handicapped in the present instance by carrying weight for art's sake. He may have in mind for future production something as painfully "artful" as any atrocity in the same line which the Theater Guild has up its sleeve, but "The Three Little Business Men" is just a good-humored show, put on for amusement and money, and done by actors whose ability is an insurance against its immediate failure. The plot has to do with one Jewish gentleman who makes a fortune out of a soft drink; the efforts of another Jewish gentleman to steal the business by strictly business methods; the triumph of virtue directed by a third Jewish gentleman whose business in life is washing windows and making people laugh; the final forgiveness of the villain by his intended victim; and a rip-roaring good-night song by the entire company. Nothing very highbrow, nothing very startling, nothing very new about the entire thing. But some very, very good acting. And good acting is rarer on Broadway now than Yiddish theaters were fifty years ago.

Schildkraut Best Known

OF THE three, Mr. Schildkraut is best known to patrons of the English-speaking stage. His reputation is not only personal but vicarious. In addition to being himself one of the very best actors in America, he is the father of Joseph Schildkraut whose characterization of Liliom in Franz Molnar's play of the same name has made him a star in the American theater. By the strange irony of fate the father, who is a more talented performer naturally, a more finished artist really, and a player of immeasurably more virile power than his son can ever be, has been struggling a lifetime to reach the position which his child attained in one bound. The only satisfaction Rudolph Schildkraut can have is the possession of a histrionic skill which in its range is probably unequaled by any player in this country.

One or two American actors do some things as well as he does. Walter Hampden is as good as he in tragedy but even Hampden is not so moving and gripping a Shylock. Lionel Barrymore is just as manful but he is not so ruggedly masculine at all times as Schildkraut. John Barrymore is as complete an artist in suavity and manner but his dramatic passion has not the depth of Schildkraut's. In addition to all these gifts Schildkraut is a comedian of consummate ease, of unerring knowledge, and of warm and unctuous humanness. Nothing could exhibit his mastery of the art of acting more explicitly than his rôle in "The Three Little Business Men," and the part of the brothel keeper in the malodorous "The God of Vengeance" whose presentation last season resulted in all concerned in it being arrested, convicted and just managing to escape jail on a suspended sentence. His last act change from a confirmed plotter to the conscience-stricken penitent is made with an ease and finish which displays his ability as an actor as completely as it discloses the absurdity of the playwright's characterization.

While Thomashefsky and Satz are names to conjure with in their field neither is the equal of Schildkraut as an actor. Thomashefsky is a big man with a big voice and the orotund manner of the old school romantic player. Satz is a low comedian who knows every trick of the comic trade (which is the same in all languages), and uses them all with effective results. His methods are more like those of a high-class comedian in our burlesque theaters than a musical comedy laugh maker. He talks to his audience with a droll intimacy which helps him score his points and also establishes a feeling of personal camaraderie which is never found in the English-language theater. That is one of the conspicuous features of the atmosphere at "Thomashefsky's Broadway Yiddish Theater." There is a friendliness between audience and actors, and in the receptions which the star players invariably receive there is evident a feeling of something more than appreciation of their talents as performers. It is the note of personal affection which is never sounded in our playhouses unless for a very old player like Mrs. Thomas Whiffen.

Just how long Thomashefsky will last on Broadway no one knows. The pace is hot there and the show business has been made more of a gamble than ever. But whatever happens, if he will only give New York a presentation of "King Lear" and "The Merchant of Venice," and turn Schildkraut loose as Lear and Shylock, he will be doing a service to those who love the art of acting and, incidentally, to a lot of American actors who make their living at it.

* * *

Yet the Yiddish dramatic theater is dying as surely as the Yiddish vaudeville theater is dead beyond resurrection. In the case of the latter institution the reason is not far to seek. Yiddish vaudeville remained stationary for years, it made no effort to develop novelty or personalities which could serve as drawing cards, and cheap motion pictures forced competition it was unable to meet.

Don't Like Their Tongue

BUT with the legitimate theater the case is somewhat different. The real reason the Yiddish dramatic theater is doomed to an early demise is that the children of those who support it now will have none of it and that the influx of emigrant patrons from the other side is not large enough to make up for the leakage. However the second generation of Jews in New York may cling to some of the racial and religious traditions of their fathers and mothers, the Yiddish theater is not one of them. They are intolerant of its prompter's box, its old-fashioned dramatic subjects, its lack of scenic finish in the productions, its absence of what is termed "class" in the environment. In a word it means nothing to them and like everyone else in the world they will not pay for what does not please them. The fine acting, which can always be seen whenever a Yiddish star appears, has no appeal for them. They do not want it, they will not go to it, and that ends it. Yiddish drama is dying because the older people who loved it, appreciated it, understood it, and supported it are dying. Their places are not being filled.

* * *

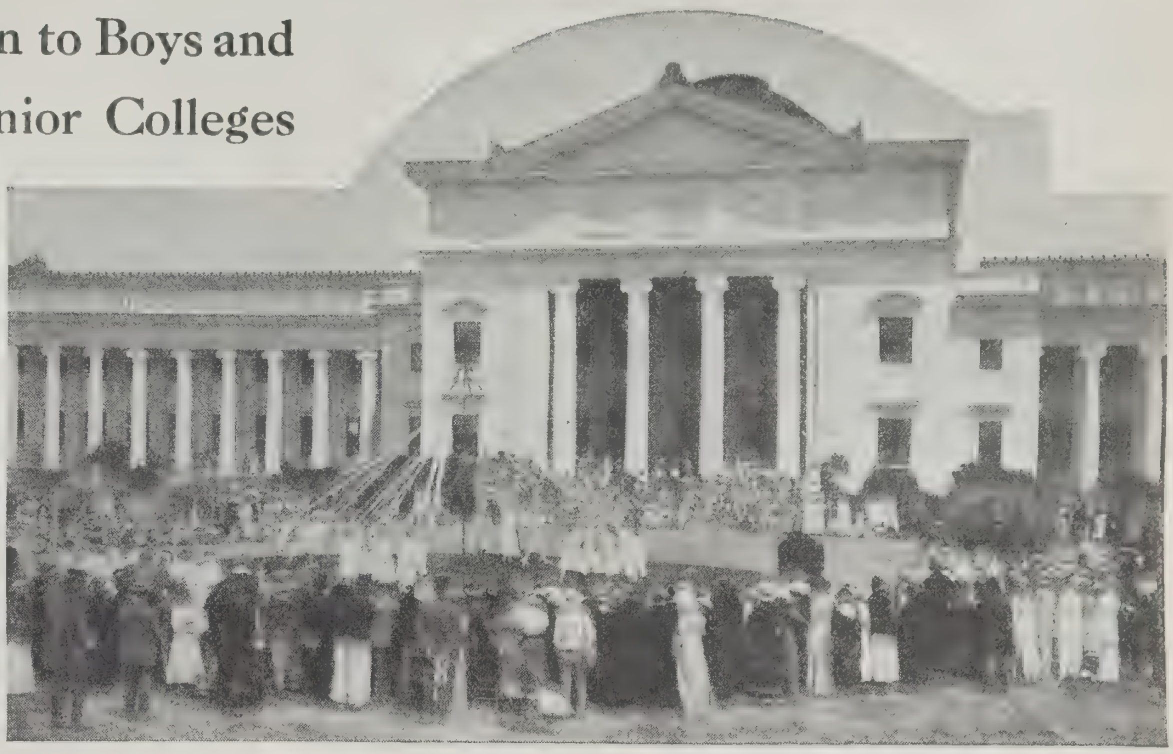
No Sunday Show—and Why

IN CONNECTION with the opening of Thomashefsky's Broadway venture a strange occurrence took place. The Hebrew actors union refused to allow its members to play Sundays uptown during the engagement of "The Three Little Business Men" although on the East Side, in Brooklyn, Philadelphia, Montreal, Cleveland, Toronto, and other cities where performances in Yiddish are given there is no such restraint exercised. The dramatic actors union of the English-speaking stage is opposed to Sunday performances in New York. It has fought every attempt made by the managers to get their show shops open on that day. Numerous subterfuges have been tried, including benefit performances for strange and unheard-of charities, but each time the union has stepped in and forbidden its members to take part. When it was announced that Thomashefsky was coming to Broadway and was going to play Sunday nights the same as he was in the habit of doing on the East Side, the English-speaking actors asked their Hebrew fellows not to set the precedent of acting on Sunday and the Hebrew actors refused to play! What is all right to do below Fourteenth street becomes all wrong to do in the neighborhood of Times Square. Sunday is the biggest day in the Yiddish theaters. If the Hebrew actors union enforced the same rule downtown that they have uptown it would be impossible for them to exist. So Thomashefsky's Broadway Yiddish Theater is unique in more ways than one. It is the only theater of its kind on The Great White Way and it is the only Yiddish theater in the United States which does not give a show on Sunday.

A Running Start for the University

How It Is Being Given to Boys and Girls Through the Junior Colleges

By HARRY H. DUNN



Building and campus of the Junior College at San Diego, California, during a celebration organized by the pupils who are doing the two first years of college work here.

IF YOU should ask the president of every public educational institution offering training above that of the high school grades: "What is the greatest handicap to the efficiency of your college (or university) today?" the majority of them would reply without hesitation, "overcrowding." From the smaller universities of the New England States, where the endowed private college is still the favorite, to the University of California with its more than 10,000 students, and especially throughout all the states west of the Mississippi River, where the state university has taken the place, historically, educationally, and in point of popularity, of the private institution of higher education, the main drawback today is the ratio of the number of young men and women demanding an education to the facilities and equipment for giving it to them.

In other words, despite all the hue and cry which has been raised in criticism of the present generation, there never has been a time in the history of the United States when the demand for higher education was so great, so widespread or so determined. On the other hand, there never has been a time—according to the average of opinion of college professors and university presidents—when such a large percentage of boys, and a considerable proportion of the girls, who attend our colleges and universities, are accomplishing little or nothing by that attendance. Never has there been a time when so many boys and girls failed to make the required credits to go farther than the first, or at most the second, year at college.

If it could be foretold, when a freshman class enters one of our colleges, just how many and who in that class would be able to pass into the sophomore division at the end of the first collegiate year, and then eliminate those who would not so pass, our colleges and universities would be abundantly able to take care of, and to educate better, those who remained. Some college presidents have said that seventy-five per cent of the boys and girls who enter our colleges would do more for themselves and more for the world if they did not attempt to carry their education beyond the high school. Other educational experts have placed the percentage higher; some lower, but none below fifty per cent.

It appears, then, there is need of an "educational filter," whereby the freshman who never will get beyond the first year may be eliminated, and the time devoted to him and his kind given over to the better training of those who will continue. This problem, of course, is complicated in the case of the state university, which, being virtually at the head of the state school system, must offer its advantages to all who apply, provided the applicants have been able to pass the high school grades.

Some western state universities have flown in the teeth of this apparently unchangeable condition by reducing their limits of attendance, some to as low as 1,000; others to 1,500 and others to 2,000. This is done on the theory that it is better to give a good education to a few than to attempt to give some sort of education to the many. Just how the courts of the several states will look at this restriction of attendance at the state universities is yet to be seen.

But, out of this problem of putting to work the tidal wave of demand for education; out of this question of how to educate only those to whom education will be worth while, has been brought at least one most interesting solution, a solution which has been on trial for about three years, and which seems to be bringing the applicant for entrance to a college, and the college itself, to a common denominator. This solution is an institution between the high school and the university, an institution which, looked at through the small end of the telescope, appears as a magnified high school, and viewed through the large end, a miniature college. This is the junior college. It has reached possibly its greatest development in the West, where, as has been said, the attendance demands put upon the state universities are greater than they are in the states where education also is supplied by older, private, endowed colleges and universities, which furnish "background" with education.

The junior college is an institution established in connection with a public high school, several public high schools acting together, or with a teachers' college, as the old-time "normal school" is now called. It offers the work of the freshman and sophomore years of the university. It is a part of the public school system. The three years' test to which the junior college has been subjected has led to the belief among educators that it is very nearly the exact educational filter needed to reduce attendance at universities.

These educators—and among them are the presidents of a number of western state universities as well as the heads of a number of private colleges in western states—believe that the junior college offers an immediate and local incentive to students in high schools, even in remote parts of the state, to continue their education. It finally delivers to the university only those students who have been able to make good.

There are several other results shown by the junior college which are tending to make it of vital importance. It gives the student the opportunity to remain under home influences; it lessens the expense, leading to the attendance of many who, graduating from high school, would not be able otherwise to continue their work; it gives state-wide assistance in bearing the burden of the state university.

California, which has made considerable progress with the junior college idea, has twenty-seven of these intermediate branches of the state university.

Of these intermediate branches, seventeen are connected with public high schools; four are attached to private schools of secondary grade, three of which are church schools; and six have been organized under recent legislation providing for junior college instruction in state teachers' colleges. Those junior colleges operated in connection with private schools are not affiliated with the state university in California, but some of the junior colleges are so affiliated, and all may become so connected if they give satisfactory instruction. The University of California has established a Committee on Junior Colleges, which, in counsel with the president of the university, sends subject representatives to the junior colleges to aid the officials to develop instruction of a type which will be satisfactory as a basis of admission. The state university also maintains a registration bureau of candidates for teaching positions in the junior colleges. The junior college which is affiliated with the state university is under obligation to seek the approval of the president of the state university in making appointments to its staff of instructors.

Students desiring to enter the state university, after completing their two years' work, may enter and receive advanced standing, based upon the credentials they bring from the junior college. The student who enters the state university from a high school, however, must either take the entrance examinations, or have the recommendation of the principal of the high school, provided the high school is accredited with the university.

The history of the origin and development of the junior college is of considerable interest. In 1907, the California legislature passed an act permitting high schools to offer the first and second years of college work in addition to the regular four-year high school course. Junior colleges were thereafter established, and in 1920 there were sixteen such junior colleges in operation, enrolling about 1,000 students, not including the junior college then conducted in Los Angeles by the University of California. The junior colleges were not, however, reaching their fullest development, and in 1921 the legislature passed a bill which changed, in many respects, the junior college situation.

This legislation, under which the junior colleges are now operating successfully, provides that the junior college must be adequately housed in a building other than the high school. It also requires that the assessed valuation of a junior college district be at least $10,000,000, though this amount previously was only $3,000,000; that the attendance at the high school or high schools in the junior college district for the school year preceding must have averaged 400 daily, and that the junior college shall be closed after its second year unless the daily average attendance is more than seventy-five. The junior college now may be organized as a separate institution, and to maintain it, a separate junior college district must be organized, a separate junior college board provided, and a separate tax levied for its support. The state now contributes $2,000 in a lump sum, and $100 a year a student, to each junior college. Thus, a junior college with the minimum attendance of seventy-five receives $9.500 for its yearly support from the state alone. There are three types of authorized junior colleges in California: The junior college department of the high school, formed under the law of 1907; the junior college department of the teachers' college, and the junior college, the two last-named having been organized under the law of 1921. Because of its local responsibility, the junior college frequently is compelled to offer three departments of work, only one of which is, strictly speaking, collegiate. The other two are offered to students not qualified to receive a college education, and consist of home-making, agriculture, horticulture or other branches of husbandry and vocational training. These increase the educational horizon and opportunities of the district in which the junior college is located and, in addition to preparing the boys and girls of that district for advanced work at the university, provide still wider circles of students with training suitable to their educational foundation and of practical assistance to them in their life work.

Campus of Chaffey Junior College, at Ontario, California, which embraces nine high school districts in the territory from which it draws its pupils.

How "Shortage Scares" Stimulate Coal Prices

Concluded from page 2

—every record that has been taken, to the best of my recollection, since I have been secretary, has been treated in the same way . . . .

Senator Walsh, of Massachusetts: Do I understand that there is no record of the proceedings of the association except those that are first submitted to the attorney and approved? Is that the only permanent record of this association? A. Yes, sir.

The transcript of testimony of the meeting of the National Coal Association meeting at Cincinnati, July 19, 1919, put into the records by Congressman Huddleston, showed the methods employed to get the newspapers into a "friendly attitude." Frank S. Peabody, one of the principal operators of the country, submitted to this meeting the report of the "committee on education." It recommended the assessment of one mill a ton, which would produce between $300,000 and $400,000 for carrying on a year's "educational campaign." (p. 1968.) Much of this sum was used for paid advertising in the newspapers.

There was some opposition to this expenditure. Several well-known operators of the country spoke in favor of an educational campaign and gave their personal contact with newspapers. The statements of two speakers (before one of the "open meetings" of the members of the National Coal Association) are submitted as taken from the purported record of the meeting of the directors of the National Coal Association as submitted by Congressman Huddleston.

On page 62 (of the record of the meeting of the directors of the National Coal Association), Mr. Brewster, discussing the subject, said:

"I saw an example of the benefit of this particular publicity, which has just taken place. The matter that Mr. Peabody had sent out by the Associated Press appeared in the St. Louis papers, and each one of the papers wrote an editorial on it. The next day after those editorials appeared, five contracts were delivered to our office which had been hanging fire. We were standing pat on certain prices, and the people were inclined to lock horns with us, and we thought we had lost them; but there is one thing that we pride ourselves on, in addition to our coal, and that is our service.

One Story Brings Back Five

"THOSE editorials reminded those particular customers who had expected a much greater reduction in the price of coal than we were willing to give them, it brought to their attention that service was going to be one of the important things, and that there was going to be difficulty in getting coal this winter. As I said before, there were five contracts mailed into the office with letters stating that they had read this story in the papers and thought they had better get back under cover. We had resigned ourselves to losing these customers, being perfectly willing to take our chances on what we believed would be a strong market this autumn and in regaining them, that tonnage on the five contracts alone will reimburse our company for our share of the probable advertising appropriation. I think we should make some provision; if a mill a ton looks too big, let us appropriate $200,000 as our advertising sum. We have $200,000; we have plenty of income to run us one season the coming year." (Ibid. v. 2, p. 1970.)

Mr. Barker, another speaker, said:

"Up to the time of the organization of the National Coal Association I think I am safe in saying that there was no industry that stood so poorly before the public as ours; we were referred to as thieves, robber barons, and so on. I was one of those who opposed the publicity campaign when it was up some time ago. The opposition as I remember it was on the ground that the country was at war, and we thought that was not the time to undertake a publicity campaign. The condition today is different. Today the National Coal Association is in a position to justify its existence. It needs to do something definite and constructive for the industry that it represents. I can think of nothing better for this institution today, for this industry, than to set us right before the public. With that in mind I have become converted to this idea of publicity. I think I am safe in saying that the coal industry has not been blamed in the estimation of the public during the existence of this organization.

"Referring to the National Coal Association:

"We have had splendid publicity, but we have not had all that we can get. That which we have done has been virtually begged from the newspapers. At one time I felt that if the newspapers were patronized and if we should attempt to cut off that patronage we would be in trouble at once. Since then I have studied the matter and I am convinced that the man that you patronize is generally inclined to be friendly to you, as long as you patronize him. But why should we not continue to patronize him if there is money in it? I am willing to gamble any time to make a dollar. That is the principle on which advertising is done. There is not a man in the hearing of my voice who is not a gambler on that question. I am convinced that if we want helpful publicity, if we want useful articles written it will be to our advantage to patronize those mediums from whom we are asking those favors, if we can do it with profit to ourselves we ought to do it, and so on." (P. 63-64 Transcript, as quoted in Senate Committee on Manufactures hearings, v. 2, p. 1970.)

Probably a more satisfactory peep at conditions was incorporated into the records from the evidence taken before the Calder Committee:

"The Chairman. In that connection, I desire at this point to read into the record from page 732 of the hearings before the Calder Committee on Reconstruction and Production as follows:

"Senator Kenyon. Now, as bearing on the activities of the National Coal Association as to publicity, here is a copy of a letter of October 30, 1920, from the director of publicity to Mr. Jenkins, vice-president of the Hutchinson Coal Company. This refers to the Cleveland meeting, I guess. (Reading):

"'It is not through mere chance that the newspapers carried such eminently satisfactory reports of the meetings. Rather it was attributable, I am convinced, to the fact that the National Coal Association, by utilizing its publicity forces as discreetly as it could do so, got into intimate touch with the newspapermen *giving operators' own interpretation of the whole affair.*

"'The night before the meeting the publicity department made it its business to see that the *Associated Press and the other news organizations,* as well as editors of newspapers in Cleveland and the correspondents of out-of-town papers who were on the spot, had an accurate idea as to the general scope of the meeting and the import of it from the viewpoint of the public. Over telegraph wires that night the Associated Press carried a news report of over 1,000 words to its 3,500 or more newspaper plants written by its Cleveland manager after consultation with the publicity director.

"'It is not straining the fact—and this is imparted in the utmost confidence—to say that the Associated Press, preceding the meeting in which emphasis was made of the fact that unreasonable prices have not generally prevailed throughout the coal shortage emergency, and in which stress was also laid upon the matter of inadequate car supply at the mines during the coal shortage, with its relation to the whole situation, was to a very large extent the word-for-word product of the publicity department. *The great advantage of this report, from the operators' viewpoint, lay in the fact that the National Coal Association nowhere was quoted as authority for the Associated Press statements, the Associated Press making them on its own responsibility.* In this way they were of more convincing effect than had they been qualified with the interference of partisanship.

"'In the news report published on Wednesday morning, after the meeting, there ran through all the news articles, both in the Associated Press, the same general tone as to the attitude of the industry toward fire and reasonable prices, this again having been impressed upon the newspapermen after the adoption of the resolution in the open meeting.'"

The report of the Calder Committee of the Senate on this point is conclusive (pp. 15-17 Calder report).

"The coal situation in 1920 was possibly more aggravated than the country has ever before known . . . .

"As early as May 1, 1920, following the release of (Government war-time) restrictions on export coal and on prices of domestic coal, with the National Coal Association stressing the unfavorableness of conditions, and with inadequate or conflicting information from various governmental agencies, the prices of coal went up . . . .

"A review of the year shows that no coal shortage actually existed, that the country produced 556,563,000 tons of bituminous coal during the year 1920, as compared with 458,063,000 tons during the year 1919 . . . . The railroads moved an average of 191,000 cars of bituminous coal weekly in the year 1920, as compared with 154,000 cars weekly in the year 1919; so there was no actual coal shortage or coal transportation shortage." (Reconstruction and production. Report of the Select Committee on reconstruction and production, U. S. Senate pursuant to S. Res. 350 presented by Mr. Calder, 66th Cong. 3d session Senate Report No. 829, 1921—pp. 15-17.)

The effect of this publicity campaign bore fruit. Agitation stimulated the buying of coal. People do less kicking about the price or quality, when there is a likelihood of a "shortage." They feel glad to think that they were able to get the coal at any price. A comparison of profits shows how satisfactorily this system of "educating the public" has operated.

David Wing, former chief of the coal section of the Federal Trade Commission, appeared before the Calder Committee and the Senate Committee on Manufactures to analyze the statistics. The increase in profits from 1916 to 1920 is graphically shown by Mr. Wing's tables:

FIELD	MARGIN OF PROFIT PER TON	
	1916	1920
Central Pennsylvania	$.08	$1.28
Southwest Pennsylvania	.17	1.27
West Virginia		
Pocahontas	.13	2.24
New River	.13	2.23
Ohio, No. 8	.30	1.15
Ohio, No. 3	.21	1.41
Illinois, No. 6	.12	.77
Illinois, No. 3	.08	.88

(Publication of production and profits in coal hearing before U. S. Senate Committee on Manufactures on S. 4878—p. 1488-90, 1921, v.2.)

How to Prevent Stampedes

WHEN combinations of capital exert such a sinister influence over the press and the people it is time that Congress bestir itself from lethargy. Legislation should be enacted which will open the books to public inspection of all organizations lobbying before Congress for "special favors" and against "unfriendly legislation." Penalties should attach for dishonest reports of officials. With the facts disclosed from operators' books and other public records, some governmental agency should be compelled to issue a monthly statement to the press which would present the situation as it is. Effective enforcement of law would prevent a buying stampede over a fabricated "shortage scare."

Honest publicity can do much. "Give light and the people will find the way," said Dante centuries ago. That sentiment is still potent. The pitiless light of true publicity on the coal situation of this country would arouse the people and check the greed for extortionate profits. Only "reasonable" profits should be permitted to those who use the natural resources of the country to produce a necessity of life. With the true facts presented, neither painted by fanatic nor unobscured by the design of those who profit by the commerce, other effective remedies will arise. Publicity poisoned at the source is a menace to the nation; the truth alone is powerful. Poisoned news sent out by the press associations finds its way into most of the newspapers, many of whom may be innocent of the fraud perpetrated on the public.

The English Mind and the Closed Garden Gate

Concluded from page 4

out the garden gate—but the interest is there. The English press reflects it, politics are shaped by it, diplomacy is its instrument. The universities do not train men for so general a profession as journalism, nor for the technical professions (though the English have excellent technical schools), but they do train them to be administrators and civil servants and judges and to carry on the human enterprises, and their youth goes out from the garden gates of Oxford and Cambridge to do hard things in far and lonely places. When they have done them they come home on a pension and play golf and keep the garden tidy, but they bring with them a widely garnered experience which gives a distinct character to English life.

They leave the garden—younger sons, and young workmen with all their wealth in a bundle of old clothes—to populate Canada, Australia, New Zealand. Such as these carry with them great staying power, an unexpected adaptability and resource and the haunting memories of the land they have left. They are the guaranty of the persistence of their racial stock and the future safeguard of the home land. It is only as one sees the dominions beyond the home country that one sees any assurance of an England great enough to continue the traditions of the past—and they know that at home.

No need to say how the Englishman goes abroad to fight, but somehow instinctively, directly or indirectly, it is for the home garden. The reaction of it all upon the land itself is probably the greatest single thing in English life. His village commons and his parish churches, his cathedrals and his Abbey, his city squares are all more than interveined, they are saturated and even spiritualized with the memories and monuments of the English soldier and sailor. The armor of kings, dust these 500 years, battle flags which a wind would undo, moving inscriptions, bronze and marble tablets, sculptured crusaders with their arms crossed over their stone breasts and their dogs at their feet, all conspire to witness how massive and unforgettable a fact war has been in English life—and the English mind reflects that.

Getting through the garden gate is another matter. It might be done by a siege, though for a thousand years now the Englishman has managed to keep the gate shut against hostile invaders. A pacific siege, a kind of sitting down and waiting for the gate to open, is possible, but it is slow and wearing work. A letter of introduction speeds up the process, but at any rate you need a point of contact to begin with. Once that is secured, either because you have approved yourself or some one vouches for you, you can go far and discuss much; you discover a really hospitable and talkative people, knowing how to make themselves comfortable and considerate of your comfort, curious about your folks and your affairs. Once started, English men and women talk endlessly. Their reticence is a myth.

They respect and assert individuality, they move in a larger region of personal liberty than we Americans, for there is less tyranny of public opinion among them and a much stiffer give and take of contrary opinion. There is a deep interior unity in English life in spite of social and political divisions going deep. They are still solidly English in the great crises of their lives, but there is far less external standardization than in America. They are frankly critical of spoken American English but there are two sides to this disturbing question. The middle class mishandle their "h's," the cockney does unbelievable things with his "ay's" and the university bred accomplish vocal wonders with their "r's" and "ere's."

The most trying type of English mind, to the American, is the "die hard" conservative. The best type is the liberal conservative solidly rooted in the past yet meeting changing conditions with a slowly yielding and constructive wisdom which has managed to make of an old feudal landholding, land-tilling state—and how they love their land—a modern, highly socialized industrial democracy, with a king on a still solidly set throne and a possible Labor Prime Minister at No. 10 Downing Street.

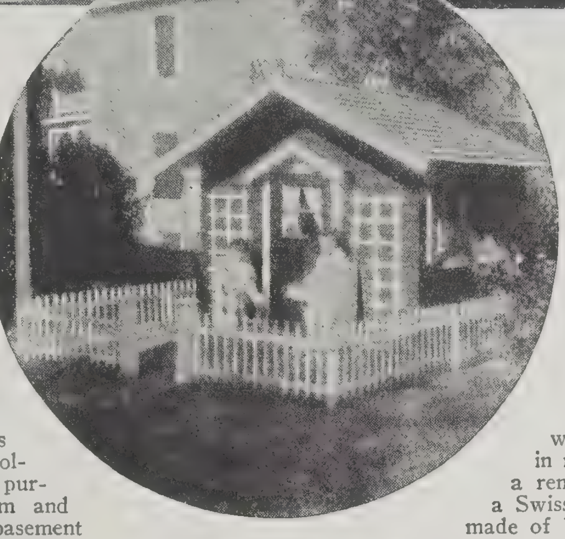
The common mind of England is today burdened, perplexed but persistently confident. England is the only European nation trying to see the European situation steadily and whole and trying for adjustments not wholly dictated by self interest. The Englishman has at this writing a million unemployed, but he still "carries on." The shadow of the war still lies deeply across his land. The long and honored lists of his dead are written everywhere in bronze and granite, and how long that list is. His monuments are heavy, wanting the grace and flying poise of French monuments, but they stand for a solidity of courage and loss which transforms them. And if you see them with a certain friendliness of insight, passing behind things to the soul of things, they and the whole of the life which is built about them are the memorials and defenses of the garden gate—the inwardness of English homes and personal life which is the key to any understanding of England at all.

Professor Makes Toys as a Hobby

Dedicates Two Weeks Before Christmas and Summer Vacation to Side Line

By GEORGE H. DACY

PROFESSOR L. J. INGERSOLL, of the University of Wisconsin, who delights in his hobby of making remarkably fine toys.



The playhouse made by Professor Ingersoll contains $50 worth of material and required 12 days of work.

L. J. INGERSOLL, a professor of physics at the University of Wisconsin, is the champion of a curious hobby—he makes original and durable toys—and has acquired such proficiency that he is qualified to earn as much money annually as a toy maker as he receives for his scientific labors.

When "Bob" Ingersoll, as he is familiarly called by his colleagues, was a boy, his parents purchased a set of tools for him and set apart a portion of their basement as a workshop. Young Ingersoll made all sorts of appliances and woodwork curios in his shop. He developed a love for amateur carpentry and a dexterity and skill in working with wood which have found profitable expression in manufacturing one of the finest equipments of toys with which any nursery ever was provided.

For six years, Dr. Ingersoll has dedicated two weeks before Christmas and a part of his summer vacation to making original and almost indestructible toys for his children. There is a sweet sentiment and romance attached to this work of making Christmas presents for your boys and girls which the average father can feel only when he successfully practices such a campaign of home toy manufacture.

"One thing I emphasize in designing the toys I make," Dr. Ingersoll said, "is originality. I never copy the types and models of toys which I see in the stores. Perhaps that is why my youngsters treasure their playthings so highly. In each case, the toy is a specialized model, in most instances is the only one of its kind in the country. I also stress the matter of durable construction and make the toys of substantial material which will withstand the hard knocks of constant usage by fun-loving children.

"I have had to solve many intricate construction riddles in my toy-making operations. Once I made a model of an ocean liner with tug. The ship rail is a very characteristic feature of the seagoing vessel. It took about a week of experimentation and careful study to devise a small scale replica of a true-to-life ship railing. Finally, I hit on the scheme of taking a small strip of window screen wire, cutting it diagonally and then stretching it to make a diamond-shaped mesh which very accurately simulates the appearance of the railing on a regulation ocean liner."

One of the most remarkable toys in the extraordinary Ingersoll collection is a miniature merry-go-round which does everything that the ordinary commercial vehicle of this description will do—and much more. It took Dr. Ingersoll about three weeks to design and construct the remarkable toy which he values at more than $200. Its operation hinges on a bicycle bearing as the chief *modus operandi*. The circle-describing vehicle is mounted on a strong elastic and indestructible base. The animals are made of durable plywood. They are modeled on designs which Dr. Ingersoll secured from the local kindergartens. The alternate animals are arranged so that they gallop as the merry-go-round is propelled by a small toy engine on a stationary cycle attached to the bicycle bearing. The mechanical arrangement is such that the circular motion of the toy causes a toy piano to play.

There is a ticket seller's box as a prominent factor in the toy set-up while the chariots and horses are patterned accurately after those on the full-size merry-go-rounds. A system of wire cables operated by the circling of the toy moves the animals and related parts. One figure consists of a motorist who goes through the motions of cranking his car as the complicated toy works. When Dr. Ingersoll cut out the figures of the animals, chariots and other objects used on the merry-go-round, he made duplicates in each instance, using the second set of figures in a popular Noah's Ark which he produced at the same time.

After Professor Ingersoll completed his scientific studies in this country, he went abroad and while traveling in Europe, he stored up many ideas which he has since reproduced in marvelous toys. One such is a remarkably accurate replica of a Swiss chalet. The toy house is made of basswood glued. The model is accurate even to its novel balcony and overhanging roof which bound the second floor of the chalet. Diminutive shutters guard the windows. The toy house is provided with a removable front which can be laid aside so that the children may have access to the interior. The chalet is furnished completely with Tom Thumb furniture, and equipment. There are even a tiny telephone, electric light system, doorbells and fireplaces which glow when the lights are switched on.

On the lawn adjoining the Ingersoll home in the university residential section of Madison, Wisconsin, stands the finest juvenile playhouse in the Middle West. It is a perfect model of an attractive little cottage, seven feet square and high enough so that a large man can stand erect inside. It is large enough to accommodate ten children. A pair of Dutch benches ornament the front doorway which is also provided with a regular mail box where the postman leaves any mail that comes for the Ingersoll children. The playhouse has a regulation number and street address. It is surrounded by an attractive picket fence. The interior is illuminated electrically and there is even a cosy fireplace as a homelike asset of the imitation dwelling. This house is another of the outstanding Christmas gifts which Dr. Ingersoll has made and given to his four fine children. It is the rendezvous of the neighborhood lads and lasses. The house contains $50 worth of building material and it took Dr. Ingersoll twelve days to build it.

A wooden engine with its tender and passenger coach that Dr. Ingersoll made for his youngsters has been played with daily for five years by four children and is still in excellent condition. It is an unusual example of how a substantially constructed toy will last if made of good material. The Ingersoll parents never allow their children to take the homemade toys out of doors, as wind, rain and inclement weather are destructive agencies which would soon ruin any toys. Electric-wire spools were used as the basis for the amateur mechanical accomplishments which make the wheels of the toy engine work just like those of a real locomotive.

A set of one hundred building blocks made of red cedar possess a very sweet and pleasant odor. They have been favorite playthings with the youngsters. These wooden blocks are made exactly like building bricks, their dimensions being one by two by four inches. Each block is twice as wide as it is thick and twice as long as it is wide. The blocks can be used to build all kinds of castles, fortifications and factories as the children desire.

Dr. Ingersoll's oldest son is now eight years old and, last Christmas, the professor gave the lad a nice set of carpenter's tools, a small workbench and a definite space in the house which he can use as his workshop. Since that time, the Ingersoll youngsters have been busily engaged in making simple toys. Their father says he intends to let them work free-lance fashion for some time and, then, after they have mastered the rudiments of amateur carpentry, he plans to supervise their activities.

It is notable that on several occasions when Dr. Ingersoll has made public exhibition of the remarkable toys at Christmas festivals in Madison, astonishing interest has been displayed in the collection—not alone by children but also by grown-ups.

The Political Line-up in Massachusetts—By F. N. HOLLINGSWORTH

MASSACHUSETTS occupies the most remarkable and powerful position, politically, of any state in the Union. The offices of President of the United States, Speaker of the House, Secretary of War, Chairman of the Committee on Foreign Relations, in the Senate, Assistant Secretary of the Treasury, and a number of other high administrative positions, are all held by sons of the Bay State.

And, while this state of affairs has caused dissatisfaction in other states, who feel that they are being ruled by Massachusetts, or that men from that state are practically running the government, it has caused almost as much dissatisfaction within the Bay State itself. The state has been slipping steadily in business and commercial importance, especially in exports and foreign shipping trade through the port of Boston, while gaining in political power. Boston is now down to ninth in export trade and is fast losing ground in the shoe and textile trades.

None of the great aggregation mentioned above has been able, apparently, to get anything for the state it represents, or, as some claim, has tried to get anything. Men in the government from other states work hard for their home interests, and see that they do not suffer, at least, to the benefit of other sections. But this state has had to sit back and swallow freight differentials that are stifling her commerce, railroad discrimination against her, lack of port improvements which have been accorded to other sections, and many other discriminations, in spite of her big men at Washington.

Republicans are not satisfied with this situation, nor with many other conditions in connection with the present administration, and it goes without saying that the Democrats are not.

This does not mean that there will be any big turnover, and a grand house-cleaning, such as Kansas had. Under the primary law now on the statute books, which is a political joke, a complete upheaval would be out of the question. It does not afford a free expression of the will of the people, but the politicians of neither party want to see it changed.

Chairman Charles H. McGlue, of the Democratic State Committee, claims that the state is normally Democratic, if the party had a fair show in electing county commissioners, apportionment of legislative districts and if the law was strictly obeyed in the matter of voting registrars and election officers. The law requires that there shall be an equal number from the two major parties, but the Chairman figures that the Democrats are about 1,200 shy on these election places.

The state committee, therefore, is preparing notices to city and town officials calling their attention to the law and demanding that it be strictly obeyed. In cases where it is not, the committee will go before the state supreme court for a mandamus to compel the officials to appoint the election officers in equal numbers from both parties.

In past years the Republicans have concentrated strongly upon the election of county commissioners. They are practically the key to the political situation in the state, as in their hands is the apportionment of legislative districts; and of the sixteen counties in the state, ten counties will this year spend a million dollars or more each in improvements. This fact alone, when considered as a matter in the hands of the dominating party, will be a tremendous vote swinger.

The state is in favor of prohibition, very strongly so, but against the Volstead Act. This may sound contradictory; but while neither party wants to return to the old corner saloon and its attendant poverty and corruption, the 104,000 majority against a state enforcement act not unlike New York's Mullin-Gage Act shows that a large number of people want a modification of the Volstead Act that will permit the sale of beer and light wines. The enormous inflow of smuggled liquor from abroad along the coast and the tremendous amount of bootlegging going on all over the state in spite of the many raids and arrests has made the people feel that something must be done to offset this stream of hard liquors and rank poisons.

However, the Republican delegation will go to the national convention as a prohibition delegation, though there are likely to be a number of liberals in the outfit.

But no great turnover may be expected, unless some great crisis appears. Massachusetts is not so conservative as she has often been rated by outsiders; still she is not so independent as the Middle West.

Many Viewpoints Held in Study of Money Question

THERE is satisfaction in the study of the Money Question, even if pursued academically. This is especially true where one is in position to review the various theories of economists who deem themselves the discoverers of the only perfect system of barter and exchange.

It would surprise the reader to learn the number of self-sacrificing patriots who have spent freely of their time in studying economic problems, and of their money to give their views publicity. The statistics of their activity have never been compiled, but the aggregate of that activity is prodigious; the amateur publications alone comprise, in printed form, everything, from leaflet to stately volume, while in manuscript there are literally thousands of schemes to be had for the asking, or offered publishers at nominal figures.

The writers of these unnumbered works are sincere, and in most cases recognize basic principles of economics and the faults of existing laws. Always, or nearly always, there is an intolerance of other views. As one proceeds to examine each theory presented, evidence is increased that "a little learning is a dangerous thing," and, though many of the amateur economists show a familiarity with the recognized text authorities, there is a corresponding lack of understanding or evaluation of them. It is one thing to have read Adam Smith or Henry George, and quite another to know their philosophies: it is still another thing to know where to classify them and how to value them.

Some time ago, the writer was shown a personal letter from one of the most distinguished of present-day economists, to a friend who was anxious to redeem the world from Usury, in which he said, "I have spent years of my life and thousands of dollars in an effort to teach the people about money, but they will not be taught. The banker, the poorest authority in the world, has more influence. His view is honest, but distorted, and is through the glasses of self-interest, by which he himself is often deceived. He rules his fellows through fear, as he himself is ruled."

Public Easily Misled

YET this man is famous through his works, his books are to be found in every library, he himself is consulted by the greatest financiers of the country. They are guided by his advice, even knowing his contempt for their practices.

Some of the most promising students of the economics of finance, although in the regular employ of the largest banks of the country, are outspoken in private life as to the inequities of our money system. The reader will note the word "inequities"; we intentionally avoid the use of "iniquities," for while either fits, it is the falsity of the system that must be considered rather than the character of its beneficiaries. When the Money system can be considered as dispassionately as a geological or chemical problem, progress will be made.

So, although many economists are intellectually at variance with their employers, the misconception which arises from their work comes oftener from what is not said by them rather than from what they say. It is remarkable how easily the public can be misled in economic matters by the simple expedient of well-selected omissions.

The general conception that the gold standard for money is the only practicable basis for a medium of exchange, because it gives a stable unit from which to measure values, is not held by economists as a rule. Some will admit that of all commodities it is the best, but even they will assure you that a commodity base can not be just or equitable. Most of them hold that the gold standard is a myth, a fallacy; that instead of being in existence, its potency is in the blind faith with which the world accepts it as being in existence when it is not.

There is a class of economists, chiefly among those to be found on college faculties, who argue that the gold standard is not perfect, but that any change must be the result of world-agreement, and that money (using the term as the name of the means for exchange) should have a better foundation. Among these students, for they are nothing else, have sprung up a craze for—not a perfect money—a stabilization of prices by changing the precious metal content of the unit. Their plan could be carried out because the unit itself is purely theoretical, never being coined or in use. They forget that all money is a measure of relative value, and that while an average price of a dozen or a score or a hundred commodities might be approximately maintained, the price of any single commodity might vary as greatly as now. Prices cannot be stabilized for the simple reason that relative values change constantly. The farmer who sells wheat to buy corn will find as much difference in relative value as the market now shows, whether the alleged unit is 23.8 grains of gold or half that amount. If it takes two bushels of wheat to secure the money to buy a given quantity of corn, where one bushel would have sold for enough to buy it a year ago, the stabilization of prices is a failure.

Another one of this class privately admits the gold standard is a failure and must go, but not yet—not until the people are educated to the proper function of money and its scientific relation to business. To an advocate of absolutely fiat money as generally but mistakenly understood he wrote: "Your argument is unanswerable, but the world is not quite ready for the change."

Money based on land values is a favorite theme for the pamphlets which daily arrive at the reviewer's table. Some are ingenious; a few recognize the possibility of speculative manipulation like that existing in a commodity "redemption," and provide for its regulation by intricate laws; others consist in merely direct loans to individuals on straight land mortgage. The latter class seem to regard the American people as borrowers, and forget the principle involved in an equitable system that borrowing will be reduced to a minimum, and land mortgages will be a thing of the past.

All reformers, however, seem to be agreed that—

1. The government should resume its function and duty to "coin money and regulate the value thereof," as stated in the Constitution, and no longer delegate the power to private corporations.

2. The gold standard is inadequate as a money base, because of the insufficient quantity of gold in the world. Bank deposits total, in this country alone, many times the total coinage value of all the gold known to have been mined since history began. Besides, gold is private property, and if demand came for a general return to depositors of their real money, no banking system could survive. The possibility may be remote, but it is a possibility.

There is comfort, however, in the knowledge that wealth is real. Money is not wealth. Money is the creation of government to facilitate the exchange of real wealth. If gold possessed any virtue not given it by government, it would represent at least the cost of its own production as metal taken out of the ground. It does not. For every dollar's worth of gold known to have been taken from Mother Earth, the cost has been more than double the natural market value of gold—double in actual expenditure of labor, to say nothing of the waste of human life in pursuing its lure.

History tells us the Aztecs and Incas, who used the metal solely for adornment, could not understand the desperate greed for gold of the Europeans who despoiled them. And we ourselves can understand it only by knowing that government has given to gold a value it does not natively possess.

One of the most elaborate schemes brought to the attention of the reviewer contemplates the stabilization of prices by regulation of the amount of currency in circulation. This is to be accomplished by the use of an index number based on the average price of a given number of commodities, as by Professor Irving Fisher's plan, save that the author proposes to dispense with the varying amount of redemption metal in the unit. In its place a government department would vary the amount of currency in circulation by buying its own bonds in the market when the index price called for inflation and selling bonds when deflation appears necessary. He would retain the Federal Reserve System, but for what purpose does not appear. The chance for speculative manipulation would appear operative here, with an additional one. In his prospectus the writer proposes the abolition of interest on government bonds. This would be fatal, since without interest there would be no market for bonds of that nature, feeding the market and withdrawing from it could not be done, and as that is the keystone of his arch, the structure would fall of its own weight.

The same writer, when another student proposed an automatic self-regulating system by which currency could maintain its own volume according to the demands of business, dismissed the idea with an imperative denial of its possibility. And yet, the fact is that in the postal service, the excess of stamps forms no inflation of the supply.

Another writer calls for the extension of the legal tender privilege to all government bonds. This would keep government obligations at par, at any rate, for the consols, now forming the security for National Bank issues, have commanded a premium steadily, although bearing the lowest interest rate of any part of the public debt. With this writer all of us may wonder that commercial paper of certain kinds is permitted to be deposited as security for the Federal issues, while the government bonds are not.

Remedy Declared Simple

A WESTERN writer calls attention to the fact that much of the currency supposed to be in circulation is not available for hand-to-hand use. That is, it is in denominations which only banks can handle in making balances and keeping reserves in small compass. Bills of small denomination are the only ones doing service as actual currency, and the only ones that can be so used. Checks and drafts are much more convenient for large transactions, besides having the advantage of having a personal ownership which prevents loss. Money lost is not easily identified. It is the property of the finder, if he is dishonest enough to keep it, but a check or draft can be used by nobody but the owner or on his order without the commission of a felony. There is absolutely no reason for the printing of a note of larger denomination than can be used conveniently by the holder.

As in mechanics, which rest on immutable natural laws, money is subject to certain limitations. These must be observed by every theorist and student. The first of these principles is that in its fullest sense Money can be created only by government; that is, no real money can exist without full legal tender quality, which government alone can give. Credit is not money, although performing the function of money within certain limits. The difference between money and its substitute is that the creditor must accept money, but may refuse the substitute. The handling of bank or individual credit is at the risk of the holder. Even after use, he is responsible as an endorser, should there be failure of redemption by the drawing signatory.

Yet more than nine-tenths of the business of the world is done on bank and individual credit, and men profess to fear that an increase of the present extremely small volume of legal tender money would be disastrous

The remedy for present monetary ills, when arrived at, will prove so simple most people will wonder it was not found long ago.

Dead Bones That Tell Story of a Continent

Concluded from page 5

in India also. They probably spread over the earth from their ancestral home, a land which once linked America and Europe across the North Atlantic Ocean.

"Here's another thing about them—the dinosaurs are classed as reptiles, because their skeletons are like those of birds or crocodiles, rather than like horses, or cattle or rabbits. And for all we know they laid eggs from which the young were hatched. If that was the case, their eggs would have made an ostrich ashamed of its production. But no eggs have ever been found, nor have any young been unearthed—all our knowledge is about the adults. Several big ones have been taken from this quarry—one called brontosaurus was more than sixty feet long, and the other, diplodocus, which has just been removed, was eighty-five feet long, stood fourteen to sixteen feet high at the hips, and could stand in water forty feet deep and keep its head above the surface. It weighed from sixteen to eighteen tons when alive. One of the seventeen vertebrae of the neck was three feet long, and the pelvic bone when boxed and still surrounded with some rock weighed a ton. Cover either of those dinosaurs with flesh and skin and breathe life into them, and even though they weren't meat-eaters none of us would care to associate with them.

"Just what happened after a few hundred thousand years had passed we don't know, but certainly the dinosaurs were annihilated, and probably at one blow. A number of things might have happened—a quick change in climate, even, for they were cold-blooded, that is, they had no means by which they maintained the heat of the body at one temperature. Their bodies were the same temperature as the outside air or the water in which they lived, just like a frog. We know only that the catastrophe occurred and the dinosaurs were destroyed.

Entire Top of Ridge Cut Off

"THAT was the beginning of a series of events which makes this Dinosaur National Monument the queerly colored place that it is. On top of those dead dinosaurs sands were piled, then shales, and more sands and shales for a total depth of ten thousand feet. Thus instead of disappearing, the bones underneath the layers were washed by water containing various silicates; the silicates displaced all the organic matter of the bones, that is, all the matter which is removed from a bone when we burn it, and just enough of the bone form remained to leave these fossils as they are.

"Piling up those layers one after another and the eventual changing of them into sandstone and the like took several million years, but scarcely was that done when another event took place which is responsible for all this hubbub. 'At that time beds of sandstone, shale and limestone more than twenty-four thousand feet deep spread horizontally over a broad stretch of the country,' when there began in its middle a great wrinkle which eventually raised a [illegible] in the earth's crust a hundred miles long and fifty miles wide running in an easterly and westerly direction. So slowly, however, did that fold progress that the Green River was enabled to cut down through the soft strata as they were lifted. The thing was like a great layer cake twenty-four thousand feet thick and with any number of strata, being humped up in the middle and cut in two by a river.

"Yet had that been the only thing which happened we should probably never have unearthed these fossils. Rain fell in abundance, and thus that great fold never reached the height which it might had it been undisturbed. It would have been twenty-four thousand feet above the present level of the Green River, or more than five miles above sea level; only the incessant wearing down by water prevented that great ridge from being. The entire top was cut off, about sixteen thousand feet of it all washed away. And accordingly the same thing happened as would happen if you cut a humped layer cake—you would see all those layers set up on an angle and even though one end were hidden you could distinguish each kind. And there are your rocks to prove this, if you don't believe it."

I looked out toward the north across those layers of coloring, across the sandstones, shales, clays and marls cut by the one hard layer on which we stood and the other in which was the quarry, and I saw that great upturned region called the Uinta Mountains. Beginning near at hand I saw those layers of pink and orange and yellow, slate, buff, coral, vermilion and white stretching away one after the other to the horizon and I wondered how much farther they went. And I could see how those strata lay at an angle of more than forty-five degrees, all except those which lay southward from the quarry. There apparently another big slip had taken place and the remaining ten thousand feet had been set up on end and even leaned over slightly backward. Were there earthquakes, smoking volcanoes, cloudbursts in the mountains those millions of years ago or not, we do not know, but when miles of the earth's crust are moved like a toy, the effort must cause some rumbling and growling and groaning on the part of the giant force which moves them.

It is a beautiful country—a country distinct from all others because of its rainbow rocks which glisten or are dull in the sunshine beneath an infinitely deep sky. Northward, the rocks and the coral castle of Split Mountain; southward, the bottomlands of the Green River with the river taking its turns through the sagebrush flats; eastward, the layers stretch as to the north; but westward, the table-lands rise one above the other, one, two, three, a dozen or more, with gullies washed in them, and as Powell says, "loose incoherent sandstones, shales and clays carved by a network of running waters into domes and cones in flowing outlines," and into tables of fantastic shapes.

Brings Wealth to Those Who Knew Only Poverty

Concluded from page 3

oil fields, and "gentlemen, you can go to hell" was the significant dictum passed from mouth to mouth and field to field whenever it became known that ubiquitous "lease hounds" were negotiating for graveyard sites. It has been reduced to verse. Nearly every oil man can say these lines:

NOT FOR SALE

By Will Farrell.

There's a church yard down at Ranger, just an acre, more or less,
Where the south winds kiss the headstones in a lazy, soft caress,
Where the chinaberry shelters all that sleep beneath its shade,
'Neath the mounds, grass grown and hidden, 'neath the fresh ones newly made.
Some are there who fought for Texas in the tragic long ago
When the swarthy Santa Anna brought his hordes from Mexico,
There are some who risked the desert when the great red West was young
And whose deeds are still unwritten, seldom told, and seldom sung.

Flowers bloom and die at Ranger in that sacred acre lot—
Jessamine and wild rose linger lest the sleepers be forgot.
Here and there a broken bottle holds a spray of withered bloom,
Bits of colored glass and china brighten up some somber tomb.
And, above it all, a belfry casts its long, lean shadows down
Like a hand outstretched for silence to the clamor in the town.
When the western dusk has fallen springs a ring of garish light
And the fevered pulse of Progress beating tireless through the night.

All around the quiet church yard and the meeting house beyond
Is a hedge of blackened derricks where the monster drills respond
To the tug of groaning cables as the beams nod to and fro,
Delving deeper—ever deeper—to the treasure far below.
Tanks attest the wealth of Midas, pipe lines strain to hold the flood,
There's a prince's ransom wasted in the sloughs of amber mud.
Yet the cry is "Give us leases. Every acre means a well.
Crowd the graveyard over yonder. Force the board to lease or sell!"

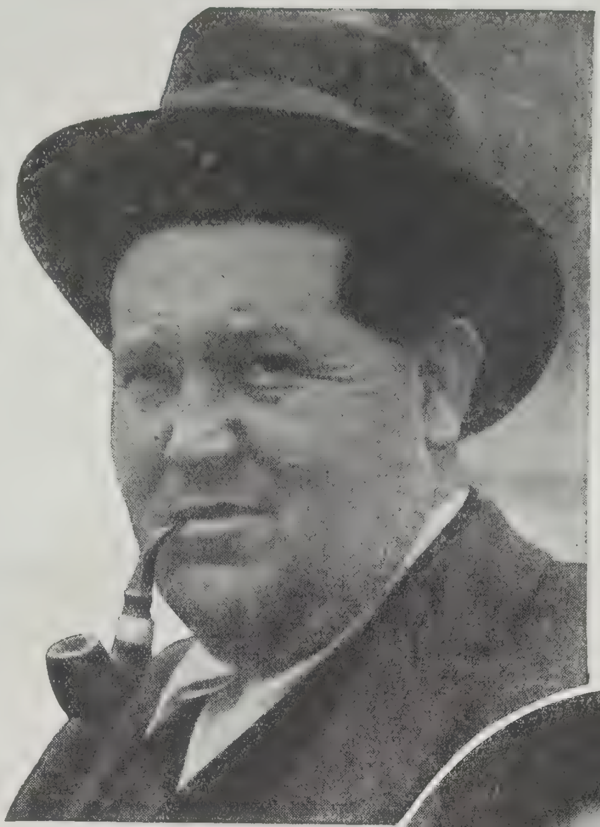
All of oildom knows the answer, when the chairman shook his head,
Gazing past the man of millions at the city of the dead.
"There is room enough in Texas,"—here he waved his palsied hand—
"There are countless acres open, and there's oil in every sand.
Why disturb the weary tenants in yon narrow strip of sod?
'T is not ours but theirs, the title, vested by the will of God.
We, the Board, have talked it over, pro and con, without avail—
We reject your hundred thousand. Merriman is not for sale."

Down the long sand trails of Texas, when the great red West was young,
Men have fought the savage desert where now thriving towns have sprung,
Where the busy derricks rumble and the drills bite, keen and deep,
Many bones today are bleaching where those martyrs fell asleep.
Yet above the trampled prairie and the oil man's reckless tread
Texas still may flaunt her banner—all her heroes are not dead.
And that Baptist church at Ranger, old and dingy, half decay,
With its belfry shadows falling on its plot of precious clay,
Is a monument eternal on that long, dim Texas trail,
Standing guard above the headstones in a lot that's not for sale.

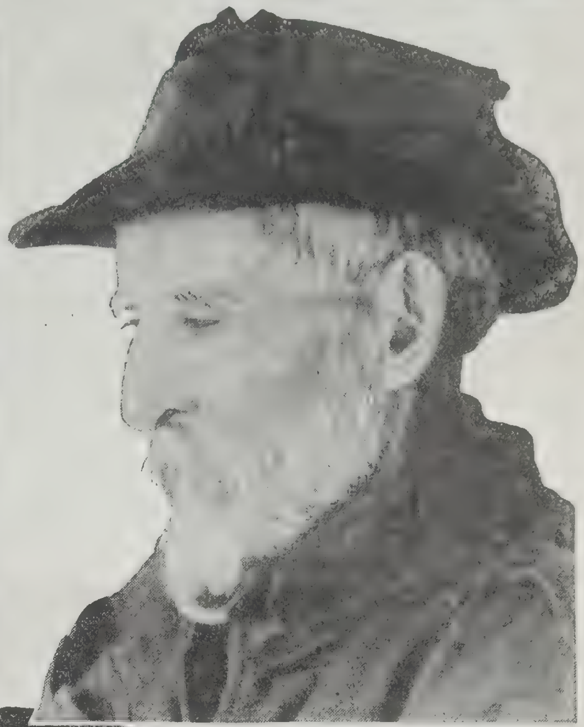
Looking for orgies, I found common sense. I looked up a dozen old-time Arkansas farmer men and women each of whom had made a fortune in oil, but I did not find one whose fortune was slipping away. For example:

There was Trav Laney, seventy-three years of age, sixty-four of them on one farm, a score of wells producing oil on that farm. There was Lije Hardin, who leased his place for ten cents an acre and then turned around and made a million on royalties. There was Uncle Billy McKenzie, squeezing a living out of his Confederate pension until they brought in a giant well on his farm. There were Tom and Jet Murphy, Smackover's village storekeepers before they entered the money class *via* oil. There was Sid Umstead, the new multimillionaire in a county of millionaires. There was Uncle Jeff Flenniken, slave Negro and eighty, whose official signature is a rudely scrawled cross, who refused to give up his mule team for a shiny new automobile. Orgies? Not they! Each of them has put it away safely and is living simply though comfortably.

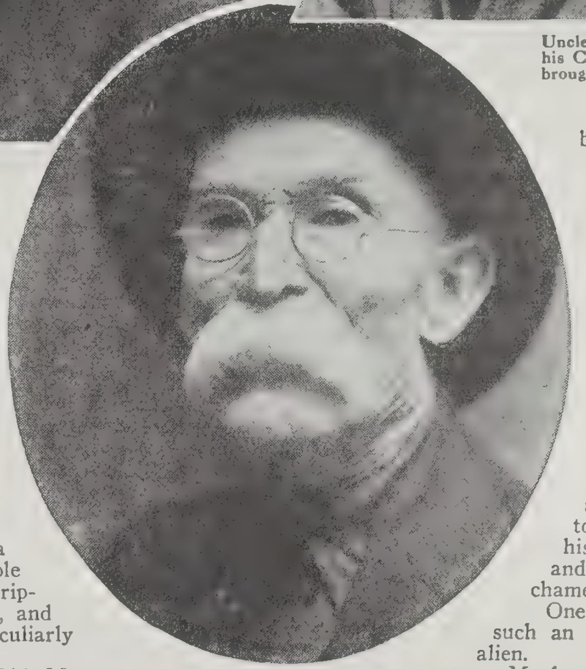
Finally, there was Sam Godbey. He has lived on his Smackover farm "coming sixty year." From his porch overlooking a sinuous bend in the creek, sitting deep in a capacious rawhide bottom chair, he expectorates with a precision marvelous to behold, and meditates, aloud, on the complexities of life as seen by a wise old man from his porch. He was comfortable and happy before oil made him rich; the transition has brought no change in his life except as it has given him leisure to study the relation of oil to his neighbors' minds. Mr. Godbey proudly calls himself a razorback and his innumerable stories at his tongue's end descriptive of razorback idiosyncrasies, and abounding, one assumes, in peculiarly razorback idiomatics.



Tom Murphy, Smackover's village storekeeper before he entered the moneyed class.



Uncle Billy McKenzie, living on his Confederate pension until they brought in a 10,000-barrel well on his farm last year.



There was Trav Laney, 73 years of age, 64 of them on one farm, 50 wells producing oil on that farm.

No, there were not any Old Mr. Dollivers in Smackover field. As the rhymester sings, "Them days are gone forever." Smackover being simply one oil field, any number of local causes might be advanced. The proximity of the region to the Ouachita River may have a bearing on the case. The farmers thereabouts tolerate the noisy oil field; they love the quiet and beautiful river. Their passion for it is as steadfast as the river's own current, as idyllic as the river's own history. Besides having the official designation in old geographies of "one of the ten most beautiful rivers," the Ouachita is the fabled happy hunting ground of numerous Indian tribes. It rises in the foothills of the Ozarks and cuts the heart of the mid-continent before it mingles its waters with the Black River, passes into the Red, and finally pours itself over the broad bosom of the Mississippi. As the Ouachita winds its length around the Smackover region, so has it wound its history around Smackover's history until the two, river and oil field, have come to a chameleon-like relation.

One cannot find orgies in such an environment. They are alien.

Maybe so, and yet, maybe not. It is a futile thing to reckon with local causes when a like condition presents itself at El Dorado, Cushing, Tonkawa, Powell, Goose Creek—at every place in this broad land where the geologists, the surveyors, the lease hounds and the drillers have come in to set awry the established life of the quiet countryside. If the orgy of spending was a gyration of the mind which we would like to forget for our own good, its complement has been a return to sanity which we can observe and record with a vast feeling of content.

Great Americans and the Sabbath—By JOHN J. BIRCH

"The one great poem of New England is her Sunday. That has been her crystal dome overhead. When she ceases to have a Sunday, she will be like the landscape growing dark; all its lines, its distances and gradations merging into sheeted darkness and night."—Henry Ward Beecher.

VARIOUS interests throughout the whole United States are engaged in a strenuous and systematic attempt to undermine the idea of the Christian Sabbath and supplant it by a day of general recreation. One of the bulwarks of this nation has been the Sabbath, dedicated to the worship of God and the concerns of the higher life. Without it the very foundations of this great country could never have been laid. In a large measure we owe our greatness, as a nation, to the little white churches on the hillsides because they were vital forces in preparing men for the mighty tasks of civilization. "Thy woods and templed hills," the familiar line in "America," refers to the churches that dotted New England.

At this time it would be well to harken to the advice given by those great Americans who so skillfully guided this land through her most perilous hours. They saw the value of Sunday reverence and its association with our physical and spiritual life.

George Washington while President ordered Sunday rest in the army and navy.

Reverend R. S. McArthur, D. D.: "A week without Sunday is like a country without the smell of flowers or the song of birds. It is like a year without summer—nothing but bleak, barren, frozen winter."

Benjamin Harrison once observed: "Experience and observation convince me that all who work with hand or brain require the rest which a general observance of the Sabbath only can secure. The philanthropist and the Christian may approach the subject from different directions; but whether we regard man as an animal or mortal we should unite in securing for him the rest that body and spirit both demand for their best conditions and highest good. Those who do not find the divine command in the Book cannot fail to find it in man."

President William McKinley, in one of his public addresses, asserted: "I am in favor of Sunday legislation and a strict observance of the Christian Sabbath."

His successor, Theodore Roosevelt, was also a strict advocate of Sunday observance. "Experience shows that a day of rest is essential to mankind; that it is demanded by civilization as well as by Christianity."

Daniel Webster, the famous orator and Secretary of State, said: "The longer I live the more highly do I esteem the proper observance of the Christian Sabbath and the more grateful do I feel toward those who impress its importance upon the community."

William H. Seward, also a Secretary of State, very emphatically believed in Sabbath observance: "Every day's observance and experience confirm the opinion that the ordinances which require the observation of one day in seven and the Christian faith which hallows it are our chief security for all civil and religious liberty, for temporal blessings and spiritual hopes."

Justice John M. Harlan, of the United States Supreme Court: "I believe that the due observance of the Sabbath as a day for religious worship and contemplation is required by commandment of God, and is vital to the purity and integrity of the social organism. While the state may not deal with this question in its purely religious aspect, it may deal with it as involved in the right to have one day in seven set apart, under the sanction of the law, as a day on which unnecessary labor shall cease upon the part of all, thereby securing for each person an opportunity for that rest of body and mind which the public health and public safety demand."

Judge McLean, also of the Supreme Court of the United States, believes in Sunday observance. "Where there is no Christian Sabbath, there is no Christian morality; and without this, free institutions cannot be long sustained."

THE LIBRARY OF THE
UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

Prominent New York Catholics protested and Nazimova's sketch, "The Unknown Lady," was withdrawn from the stage. Since the protest has been effective in this instance it would be a public service if the protestors should follow up their success.

Sawgrass, a tall grass that grows in marshy places of Florida, is used for paper pulp.

The old oath of the Scotch grand jury man was, "You shall present no Person for Hatred, Malice, or Ill-will; nor leave anything unpresented for Fear, Favour, or Affection."

"Schiebers" is German for profiteers. Germany has two crops—the *Kriegsgewinner,* or war profiteers, and the *Revolutionsgewinner,* or those who grew rich out of Germany's political upheaval. A third crop is now growing out of the financial exchange situation.

Recognizing the dog as the original and most reliable burglar alarm a great insurance company cuts rates for residence burglary, theft and larceny insurance where one is kept.

A watch that can be automatically corrected twice daily by radio has been devised by a lieutenant of the naval air service.

Farmers, living within one mile of the post office or rural mail station, will be entitled to receive special delivery mail by carrier, according to an order recently issued by the Postmaster General.

Of every hundred young men who begin as railroad firemen, only five ever reach the position of passenger engineer.

Rosa Raisa's real name is Raitza Burtstein. Her father was a wealthy Jewish contractor in Russia.

The Chinese "mine" the 2,000,000-year-old fossilized remains of prehistoric animals for use as medicine, to supply Chinese drug stores with "dragon's teeth," and "dragon's bones."

Animal hunters employed by the government use oil of catnip as a lure when hunting mountain lions and bobcats.

More than 290 Negro agricultural extension agents show Negro farm families how to put into practice improved methods of managing the farm and home.

The female rôles in Turkish theaters are nearly always played by Armenian actresses, as Turkish women are forbidden any part in theatrical performances.

Ruins of a city, believed to be a thousand years older than Rome, have been discovered near Ferrara, Italy.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Sir Alfred Mond, British Jewish leader, was greatly astonished on his recent visit by the wealth of America. "The country is overwhelmed with money," he said, "I saw most of the financiers, bankers and leading industrialists, and they regarded anyone with less than $50,000,000 as very small beer and would hardly look at him." The inference would be just that Sir Alfred saw few Americans.

Former cabinet ministers in Spain are prohibited from holding positions as directors or members of administrative councils of corporations.

"You can't sell sentiment in Washington," cried a sweating auctioneer as he knocked down for $45 a mahogany sofa, two armchairs and one other chair—all upholstered in velour. The furniture was formerly the property of Warren G. Harding.

Before the earthquake the Japanese Government had allotted $110,000 to the "Social Affairs Bureau" to encourage Japanese emigrants to go to Brazil. More than 100 local intelligence offices in different parts of Japan promoted the movement.

Miami, Florida, spends $275,000 a year for tourist advertising.

The highest mountain peak in New Zealand, a land of hot springs and glaciers, does not attain more than 12,350 feet. Mountain climbers marvel at the scenery which is unexcelled.

Mistaking a fire box for a mail box a New York man laid his letter on top and pulled the handle. Four engine companies, two fire trucks, a water tower, two battalion chiefs and a deputy chief arrived in great excitement. A fireman mailed the letter in a near-by mail box.

"Popular opinion is not far wrong in its attitude toward authors who create odious and repulsive characters, the embodiment of debased, perverted passions and ideas, suspecting uneasily that the thoughts and feelings of the characters may be those of the author himself."—Jacinto Benavente, Spanish playwright.

The professor of Chinese at Columbia University says that Chinese is not a difficult language to learn and that any intelligent person may gain a working knowledge of the language in three months.

New species of insects are being found and classified at the rate of 6,000 a year.

Claiming that it creates a wrong impression of British justice, the chairman of the Board of Governors of Toronto University says Longfellow's "Evangeline" should be removed from all Canadian schoolbooks.

A jade amulet discovered at the San Juan de Teotihuacan pyramids, near Mexico City, had the following engraved Chinese inscription: "The golden fish that passes by the Dragon's gate is converted into a dragon." The Chinese Legation readily interpreted the inscription which is a quotation from a very old Chinese lyric.

In personally receiving representatives of the Lord's Day Alliance, President Coolidge said: "I profoundly believe in the Sabbath and have always recognized its sacred importance. I appreciate the work your organization is doing for the preservation of the Christian Sabbath, and, with you, I feel that we should give attention not only to the physical aspects but also to the moral and spiritual phases of the Holy Day."

Truck gardeners in Florida have experienced severe losses in crops through land crabs, which devour and injure young and tender vegetation.

Bolivia is the only South American country without a seaboard.

"The people that came to this country in the early days were of the beaver type and they built up America because it was in their nature to build. Then the rat people began coming here to house under the roof that others built."—*Secretary of Labor Davis.*

MEETING THE "FACT" SHORTAGE

That is what THE DEARBORN INDEPENDENT is doing. For nearly five years it has been telling the people plain facts about things which they did not know or understand. That's why it is called the "Chronicler of the Neglected Truth."

Today THE DEARBORN INDEPENDENT has over 500,000 subscribers. You can become one by using the blank below. Do it today.

CHRONICLER OF THE NEGLECTED TRUTH

Thousands Buy Bogus M. D. Degrees to 'Practice'

Inquiry Into and Expose of Issuing of Fake Diplomas Bring Startling Facts of Charlatans Who Are Totally Unfitted for Professional Work

By J. OLIN HOWE

ASTOUNDING, incredible, fairly taking one's breath away, are facts just now coming to light as to so-called medical colleges in St. Louis and Kansas City which have scattered over the country great numbers of bogus diplomas and spurious M D. degrees.

The medical faker is everywhere, apparently. Literally thousands of men and women about this broad land are practicing medicine without being in any real sense fitted to do so.

They have not the mental equipment, in medicine or surgery or even as to general intelligence, which warrants their being permitted for an instant the power over life and death which their state licenses give them. These are mild words in the face of the awful details.

In reality, these are crooks and criminals. Their very licenses were obtained by chicanery or worse. And back of them are the lying medical diplomas and fraudulent high school certificates.

Street car conductors, traffic cops, mechanics, bookkeepers, saleswomen, photographers and many others, uneducated and often illiterate, have become "Doctors of Medicine" by a stroke of the pen, when they had the money to pay for it. Some of them never put in an hour's study on which to base these diplomas. Some never were in the city in which they were issued.

Simply Diploma Mills

UNDER-SURFACE rumblings over this situation in the past are well justified by the revelations—first in Missouri, and now in Connecticut, New York, New Jersey and other states—as to the workings of these medical diploma mills in the two cities mentioned. Connecticut is one of the states where the men who operated the fake medical schools, who are now under indictment in Missouri, found it easiest to get state licenses for their "graduates."

And there a grand jury, first to be summoned in the Nutmeg State for more than a hundred and fifty years, is deep in an investigation of the miserable business. Governor Templeton, who last spring vetoed legislation greatly desired by the eclectic school of medicine, has pledged himself and his administration to a full clearing up of Connecticut's part in it all. The licenses of scores of physicians will have to be revoked. Some have already fled the state.

This is one of the biggest news stories that ever broke in this country. It comes home to every one of us in some way. It will be a front-page story for months. Its ramifications extend into every state in the Union—and, in fact, far outside this country.

No state is free of these bogus physicians, who never heard of the Oath of Hippocrates. Arkansas, Colorado and, until lately, Florida, rank with Connecticut in the leniency and inadequacy of the laws under which one who wishes to practice medicine may obtain a license. But through the reciprocity system in vogue among the states these doctors, once licensed, were free to go almost where they pleased.

Statutes must be revised in many states before the medical situation is upon a sound basis. And probably not only the eclectic school of medicine, but other schools as well, will have to clean house.

In numerous cases, of which particulars are already known, possessors of these St. Louis and Kansas City diplomas have purchased the practices of well-known and reputable physicians, and with this leverage have found little difficulty in making their way into the confidence of the community. Doubtless many of them got into the army during the war.

In any case, some have turned up in veterans' hospitals, where the poor fellows who are wearing their lives out have had the care of these pseudo-physicians. Civil hospitals have had them on their staffs, and have still, for that matter—men with faked M. D. degrees who never completed a course in medicine or surgery, whose knowledge of anatomy is slight and of chemistry far slighter.

15,000 Fakes in U. S.

THERE are probably 15,000 fake doctors in the United States. At least 2,000 of them are believed to be in New York City alone, where the Missouri diploma mills have recently had their active agents.

"The day the first newspaper story was printed," said Dr. S. Dana Hubbard, of the New York Health Department, "we had eight complaints against these fakers with M. D. signs in front of their doors. There are hundreds of them here. A day or two ago I saw a sign in the window of a Myrtle avenue house in Brooklyn with a man's name and 'M.D., D.C., D.S.O.' after it. I rang his bell and started to question him, but when he found I was connected with the Health Department he slammed the door in my face. I sent a policeman and inspector 'round there, but the sign had been taken from the window and the man was gone."

Not a state has made its regulation of the medical fraternity tight enough to keep these fellows out. Even Alabama, with the best medical practice act among the forty-eight states, and Minnesota, a poor place for the medical faker, haven't succeeded in doing so. An odd fact about it is that while these "doctors" pass eclectic examinations and are licensed by eclectic boards, they more often practice as allopaths, though doubtless usually unrecognized by the county medical society of that school.

The public knows little of that last. For $150 they can purchase the electric apparatus, known among the fake diploma peddlers as a "sucker machine," and pose as using the latest discoveries of science. It is but a step from the use of the violet ray to the X-ray. Who can say how many cases of cancer and how many deaths from that dread disease have come from the ignorance and cupidity of these charlatans?

The St. Louis College of Physicians and Surgeons was formerly an eclectic medical college, but some years ago was merged with the National University of Arts and Sciences, losing its identity until revived by Drs. Waldo Briggs, Robert Adcox and Ralph A. Voight. One does not know as much of the Kansas City College of Medicine and Surgery, conducted by Dr. Date R. Alexander. The two institutions have been affiliated in issuing bogus medical diplomas.

It is an interesting thing, too, that William P. Sachs, former examiner for the Missouri State Board of Education, who issued the faked high school certificates these doctors must have to accompany their diplomas, was formerly connected with the university mentioned. He and the three doctors are under indictment for these various frauds in Missouri.

Drs. Alexander and Adcox sometimes accompanied batches of "graduates" to Connecticut when the latter were taking examinations for licenses before the state eclectic board, and at least twice the latter took the examination himself as early as possible and finished quickly so as to be able to pass on to the others in his party the list of questions and their proper answers.

The experience of "Dr." George E. Sutcliffe, of Unionville, Connecticut, is typical of how all this St. Louis knavery works out. Sutcliffe is facing apidly for manslaughter. He has lost patients ver he Con- in the short time he has been practicing in Tl World necticut mill town. Last May, Albert Hoody, a W a War veteran, crushed a finger of his right hand in press in a factory across the way from his office.

Dies Under Anesthetic

THE regular physician for the plant was away and Hoody's friend, Cook, rushed him to Dr. Sutcliffe, who made a couple of tests and prepared to cut off the remnants of Hoody's finger. The latter didn't care to see the operation, so Sutcliffe poured some ether on gauze and put the patient under the anesthetic and then passed ether and gauze over to Cook to continue dropping the ether on the gauze while he performed the surgery.

Cook continued as instructed until three cans of ether had been used. Dr. Sutcliffe had practically completed removing the crushed finger when Hoody gave three gasps and died. Sutcliffe, who had occasionally felt Hoody's pulse, dropped the finger and he and Cook and Dr. Dunn, who arrived about that time, applied artificial respiration and used a pulmotor persistently and tried other restorative means, but to no purpose.

The man was gone.

But there was no trouble over it at the time. Dr. E. M. Ripley, the Unionville medical examiner, is the physician whose practice Sutcliffe bought out and he was satisfied all was as it should be in the case of Hoody. The latter was gassed in France and this was believed to account for his having been suffocated by the quantity of ether used on him.

Recently, however, the St. Louis *Star's* exposé of these bogus medical colleges caused interest in the number of their "graduates" in Connecticut, which is large, and it developed that Sutcliffe was a key man out there. He was a photographer when in 1918 he decided he'd like to become a doctor. He was introduced to Dr. Briggs, who enrolled him as a four-year student in the St. Louis college. Sutcliffe had no high school certificate, which a medical student must have, and one was procured from Sachs, for which Sutcliffe paid five dollars.

Briggs first put Sutcliffe down as a freshman, but he was operating a two-year school, at best, and soon changed him to the status of a junior, fixing the records to show he had entered the school in 1914. Sutcliffe saw diplomas being sold by Briggs—for $250 up—especially to Adcox, who was paying $1,000 then. There was no set price, though, and some diplomas brought only $150.

Finally Sutcliffe himself slipped a diploma out to a friend for $50, with "bum signatures on it," he says in his confession to Governor Templeton. He has one diploma Briggs gave him dated 1918, but insists he did two years of work and "graduated" in 1920, when he got another. Sutcliffe went to Colorado and succeeded in passing the examination of the state eclectic board there. He practiced for a time in Ray.

While there he coached "a bunch of dumbbells" sent him by Adcox, twenty of them at fifty dollars a head, on the answers to 250 questions sent from St. Louis. The seventy-five or eighty questions the state board would ask were said by Adcox to be among these 250. Sutcliffe claims not to know how many candidates passed. He doesn't even know that they had studied anything before they came to him, for he says many he does know of never came near the college till they came to get diplomas and their pictures were faked into the class pictures later.

Finally Sutcliffe bought a Connecticut license from a man as yet unnamed (who had himself failed to pass the Colorado examination) for $100 and moved to Connecticut and located in Unionville which he wouldn't have done, he says, had he known there were so many "P. and S." graduates in that state.

Very dramatic is the story of how all this villainy came to be exposed. A filmy tip came into the office of the St. Louis *Star* and put Harry Thompson Brundidge, feature writer for that enterprising newspaper, a chance to serve humanity. This he grasped without delay. The tip was that high school credits could be bought and that Dr. Adcox knew something of that and also about an irregular diploma or two.

"Schooling the Bunk"

BRUNDIDGE dropped his last name and became a coal salesman in the employ of a friend's company. He sold coal. Then he went to live near Adcox. He had his throat infected with tonsillitis germs (!) by a physician friend, became ill and called in Dr. Adcox. The newspaperman intimated he was jealous of the doctor's profession and at length came right out with his desire to become one himself. But he was thirty and too old to go to medical school.

"Schooling is the bunk," said Adcox and outlined a plan to get Brundidge the needed high school certificate and credits showing three years' work in medicine and, despite the fact that Brundidge couldn't possibly understand senior work in a medical school, deliver him a diploma and M. D. degree. Brundidge a bit later said he didn't wish to go to school and Adcox assured him he should have the diploma, anyway.

[illegible] He met Adcox, and after him, Voight,

diploma for a friend, a fellow newspaperman. Adcox offered this friend his choice of the St. Louis or Kansas City colleges from which to "graduate."

Drs. Voight, Adcox and Alexander were arrested on October 14 and next day the *Star* ran the story. And on that day the prosecuting attorneys of St. Louis, St. Louis County and Kansas City personally supervised a search of the homes and offices of these doctors. These raids netted four huge packing cases full of letters, documents, affidavits, high school certificates, diplomas, state seals, county seals, university seals and other paraphernalia and documentary evidence.

School Head Confesses

THESE led to numerous other states, in most of which detailed investigations have not yet been begun. They linked together others than the doctors named with them as members of the diploma ring. They involved state officials in Missouri and elsewhere. The activities of this group had been nation-wide.

Dr. Briggs, however, remains dean of the St. Louis College of Physicians and Surgeons, accuses Dr. Adcox of having duped him, has expelled some students of the institutions and threatens action against 150 graduates of his institution on credentials he now knows to be fraudulent.

B. H. Jolly, county superintendent of schools for St. Charles County, has confessed his connection with the fake diploma distributors and admits selling them and others many high school certificates.

Letters and other papers found in these raids led straight to Connecticut and to such an extent that the governor of that state and the state health authorities could not miss the point. They haven't. Brundidge is in Connecticut at this writing aiding the special grand jury, the foreman of which is a nationally known lawyer —and a very live wire—Benedict M. Holden, of Hartford.

There is ample material for an article devoted to the Connecticut situation alone, telling, among much else of interest, how one of the "graduates" of Dr. Alexander's college went on the Connecticut eclectic medical board, after which neither Alexander nor Adcox felt obliged to go personally to that state.

"Dr. Sutcliffe came to us through a reciprocity arrangement with Colorado," says Dr. James E. Hair, secretary of this Connecticut board. "We took him at his word as to his credentials. If you come to me and tell me you're a graduate of Yale, you wouldn't expect me to doubt your word, would you?"

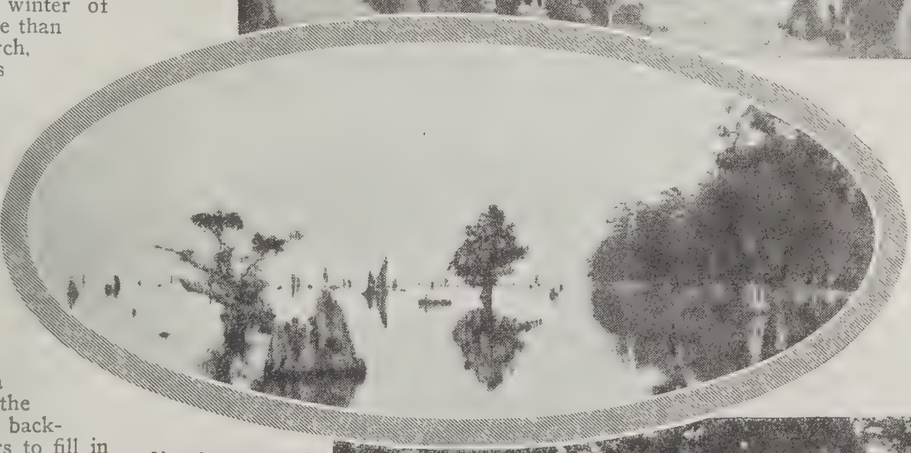
Reelfoot Lake Will Be Saved as Fowl and Fish Preserve

State Steps In to Keep Tennessee Holdings From Being Exploited

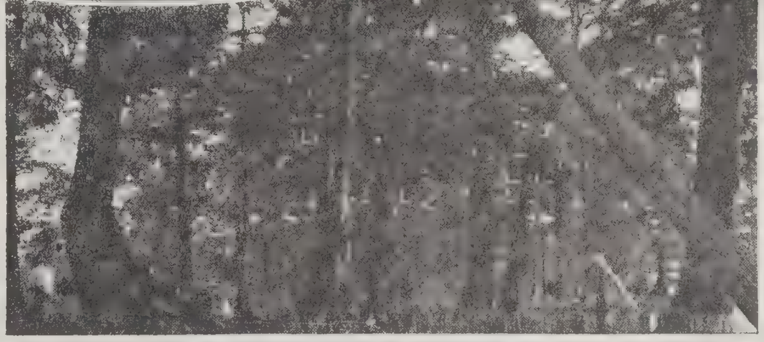
By T. H. ALEXANDER

He fished exactly thirty-five minutes for these with a hook and line.

Typical fisherman's hut at Reelfoot.



Note the stumps and trees left in the lake by the earthquake.



Timber on the edge of Reelfoot Lake.

IF YOU will examine a map of Tennessee and Kentucky you will find, sprawled in the western part of each state, like a giant centipede sunning himself on a rock, a vast expanse of blue. It is Reelfoot Lake, the happy hunting ground of a dozen American states and incomparably the finest fresh-water lake in the whole South, if not the finest east of the Mississippi River.

The life of Reelfoot Lake has numbered one hundred and eleven tragic years since it was formed by an earthquake in the winter of 1811. Violence and bloodshed over the disputed lands lying under and around the lake have marked almost each year of its history. Vast sums have been spent in litigation over the titles to the lake lands. Now the state of Tennessee owns the lake in trust for all the people and soon, if present plans are fulfilled, every foot of land around the lake will be a state-owned game preserve—the greatest state-owned game sanctuary in America.

The earthquake that formed Reelfoot Lake began in the early winter of 1811. It continued for more than three months until by March, 1812, more than 75,000 acres of land had sunk to a depth of from seven to thirty feet. The final convulsion of nature opened a passage from the sunken land to the Mississippi River, three miles west, and the Father of Waters rushed in to claim its new-found conquest. In less than forty-eight hours the sunken land had become a great lake. The waters of the Mississippi River flowed backward for twenty-four hours to fill in the void left by the subterranean disturbance. This is well-authenticated history.

As the land sank it carried with it about one hundred square miles of virgin forest. The storms and winds of more than a century have swept away many thousand trees but thousands yet remain in the lake, gaunt specters of the great earthquake that shook the American continent during pioneer days. Some trees have died and these rear their blasted limbs skyward like the masts of ships, but others still flourish. It is a flooded forest which makes a natural breeding place for fish and waterfowl.

Now one hundred square miles of land was not much in the days before Tennessee was formed and in the days when the parent, North Carolina, gave grants of hundreds of thousands of acres.

Twenty-four years ago saw the first efforts of private individuals to gain possession of the lake. J. C. Harris, a prominent planter of Tiptonville, Tennessee, bought up all the old grants purporting to convey title to the lake from the states of North Carolina and Tennessee. He then dug a canal from the lake to the Mississippi River and set about to drain the lake. The land under the water, enriched by the top soil from the surrounding hills, was conceded to be richer than the proverbial valley of the Nile.

These efforts met with prompt resistance. Owners of hotels and hunting lodges on the eastern shore of the lake contested the move on the grounds that the lake is a navigable stream of water and as such is public property and cannot be drained or molested. The supreme court of Tennessee disallowed the contention but held that the titles to the lake were too vaguely described to hold good. And thus the first effort to drain the lake was estopped.

A large corporation, the West Tennessee Land Company, stepped into the scene in 1902. It bought up all the titles to the lake based on the old grants to the land, some made as early as 1788, and attempted to close the lake to all except those fishing and hunting for pleasure. A storm of protest greeted this policy. Generations of fishermen had lived on the banks of the lake. It was taught by father to son that the lake was public property and belonged to no man.

Six years after the formation of the land company a wave of lawlessness swept over Tennessee and Kentucky. It took the form of organization of "Night Rider" bands which preyed upon the tobacco planters in an effort to force all tobacco farmers to join an association to control the price of tobacco. The Night Riders rode by night in masks. Shortly after the organization of the tobacco Night Riders, a similar band was formed at Reelfoot Lake. Its expressed purpose was to drive the West Tennessee Land Company out of existence.

Meantime the land company had gone into court and secured injunctions against the independent fishermen restraining them from fishing or hunting on the company's property. Colonel R. Z. Taylor and Captain Quentin Rankin, both of Trenton, Tennessee, and both large stockholders in the land company, went to the lake on October 19, 1908, on business for the company. Colonel Taylor had been an officer in the Confederate army. Captain Rankin had been in the Spanish-American War.

Without thought of danger from Night Riders, these two went to the lake. At midnight the Night Riders came, armed and masked. They aroused Taylor and Rankin from their beds in the little hunting hotel at Walnut Log, Tennessee, and forced them to go along the banks of Bayou de Chien just south of the Kentucky border. The smouldering hatred of a generation burst into flame as the hooded fishermen questioned the representatives of the hated corporation.

As Colonel Taylor was questioned he was struck by one of the masked men.

"I am not afraid to die," said Colonel Taylor. "You can't scare me that way. I have been here sixty-two years and you can't cheat me of many years of life, but it is different with Captain Rankin; he's a young man."

Balked by Colonel Taylor, the Night Riders turned their attention to Captain Rankin. They left Colonel Taylor guarded by a small squad and slipping a noose over the head of Rankin they pulled the rope over a limb.

"Let's give him time to pray," suggested one of the Night Riders.

"I have already attended to that matter," replied the intrepid Rankin, and as the rope tightened around his neck he exclaimed:

"Gentlemen, don't do that; you are killing me."

"That's what we intend to do," responded one of the leaders of the band and as he said it someone fired a shot. Then came a fusillade of shots. The half-hanging man uttered a cry and slumped forward and Captain Quentin Rankin, a courageous Southern gentleman, was dead.

Colonel Taylor waited until he believed all the weapons had been discharged then sprang into the bayou and escaped. Whether he gave, as is tradition at Reelfoot Lake, a fraternal signal of distress which was recognized and answered by one of his detached squads of guards, may never be known, but he escaped, swam the slough under water and hid behind a log while his captors searched in vain for him. After lying hidden for hours, he wandered westward for two days until at last, half dead from exposure, he was picked up by a rescue party in Lake County, Tennessee, just south of Hickman, Kentucky.

The Night Rider tragedy shocked the moral conscience of the nation. Malcolm R. Patterson, afterward to come into the public eye as the pardoner of the slayer of Senator Edward Ward Carmack, was then governor of Tennessee. He ordered out the state troops, established a camp at Samburg, Tennessee, the chief fishing village of the lake, and took personal charge of the investigation.

Between forty and fifty men were arrested for the crime, six of whom were sentenced to death and two to twenty years' imprisonment, but the state supreme court reversed the sentences on a technicality and further prosecution languished. The Night Riders were never punished.

Five years later, in 1913, the state gained complete possession of the lake by condemnation proceedings, paying $25,000 for the property which is conceded now to be worth several million dollars, could peaceable possession be obtained.

The shore line of the lake is now approximately eighty miles in length and of this the West Tennessee Land Company owns more than nine-tenths, for the title of the state covers the lake but extends only to the low-water mark. The riparian landowners have cut away many miles of the once virgin forest. More than 2,000,000 pounds of fish are taken annually from the lake, almost a million pounds of which are sold for profit, and the annual kill of ducks, small game and fur-bearing animals is estimated at more than $1,000,000 in value. To conserve the game and Reelfoot and provide a great game preserve Governor Austin Peay has recently approved the program fostered by the Nashville *Tennessean*. This program calls for the purchase by the state of the entire holdings to prevent cutting of timber and open a great area for game preservation.

Alarm over the future of the lake was caused throughout the South by the recent discovery by the state geological survey that the area of the lake has shrunk from 56,000 acres in 1908 to only 21,000 acres in 1923. The shrinkage was due to erosion. The state government expects by proper drainage methods to stop this filling in.

Reelfoot is declared by national game authorities to be the finest natural fish hatchery in the world. In spite of years of commercial fishing the black bass, the crappie, pike, brim, carp, cat, striped jack and a dozen other varieties of fish abound at Reelfoot. Here is found the spoonbill catfish. The spoonbill's roe makes better caviar than the eggs of the giant sturgeon from the waters of the Volga.

At the first signs of frost the migratory waterfowl wends his way to Reelfoot from the celery fields of the Northwest. Here also are found the wild turkey, the wild goose, the lordly heron, the crane and the egret from whose plumage come the priceless aigrettes.

Police in Stiff Task: To 'Clean' New York Plays

With Nothing to Be Expected From Producers, Authorities Must Act

By PETER SCHUYLER

ONCE again there is a movement to clean up theatrical Manhattan. This time it is Police Commissioner Enright who has taken the broom in his capacious fist. Of course the commissioner is not going to do the cleansing, except vicariously. The actual work is to be performed by a committee of three, consisting of a deputy police commissioner, a woman member of the detective bureau, and the secretary of Mr. Enright. It will be observed that the theatrical disinfecting squad is made up of those whose police experience has hardened them to shocks against the old-fashioned virtue of modesty. The rate at which the producers are going in for filth and nakedness demands that the persons chosen to delouse the stage be experienced in dealing with iniquity. At this writing nothing has come of the plan except a loud roar of indignation from the people who do not want censorship of any kind except that of their own choosing.

A year ago, about April Fool's Day, as a result of some particularly rotten shows which were then running, a scheme was drafted by the managers, the authors, and the actors' union which was intended to head off what looked like a censorship as drastic (for publicity purposes) as that under which the motion picture producers are now squirming. There was to be a jury of twelve good men and true drawn from a list of four hundred volunteers who were supposed to have no connection with the theater, except as patrons. If a complaint was made against any play, the jury sat on the case. If the vote was nine to three the volunteers might order changes in dialog or situation or action. The jury might even order the play to be taken off the boards and the producing managers agreed to obey. What would happen if the producer refused to live up to his promise, no one said. The jury could do nothing except hold him up as a target for that very doubtful sharpshooter, Public Opinion, to shoot at. If the producer of the dramatic noisomeness happened to be outside the ranks of the Producing Managers Association he could thumb his nose at the jury and continue with his play without fear of interruption except from the law. Of course the law could be enforced, but to any sophisticated Manhattanite the enforcement of any law is a joke. Fortunately for the composure of those who created the gigantic idea of the volunteer censorship, it was never put into practice. The New York *Times*, with an innocence that is remarkable, explains the failure to function by saying, "The system was never tried, for it was never needed." This in the face of its own columns in which appeared all the details of the arrest and fining, last season, of the actors, actresses, and the producer of "The God of Vengeance," which began its career of viciousness down in the Provincetown Playhouse. This is one of the "little" theaters which so great an authority as William Archer declared to be "the hope of the American drama."

Jury Plan Forgotten

IT MAY be remarked in passing that the suppression of the play was urged, not on the score of the incredible foulness of some of the scenes in it, but because it reflected upon the Jewish religion, adherents to which very properly smashed it.

So the "volunteer jury" idea was suffered to snore on uninterruptedly, not because "it was never needed" but because it was afflicted with fatal sleeping sickness from its birth.

But theatrical producers, as a class, have no sense of public decency. They are engaged in serving amusement to the people simply and solely for the money involved in the game. They have no business morality and it is hardly to be expected that they will have any other kind. Money and money alone talks for and to them.

The dramatists, too, rise in their might when anything that savors of a restriction on their output is mentioned. Slightly less cynical and less frank than the producers, they base their claims to write anything they think will bring in royalties on the grounds of "artistic freedom." Their art-loving souls storm at the very thought of anyone or anything coming between them and what may bring an addition to a weekly percentage of the box office receipts. They are said to be responsible for the clause in the volunteer jury scheme which calls for a new set of twelve good men and true to sit on each specific complaint. This makes for what is ingenuously called "flexibility" among the jurymen.

The actors union is concerned only with getting work for its members (in the sense of not inhibiting any effort at production) and seeing that once hired they are not cheated out of their wages. In fact, the new agreement which has recently been ratified by the organization, although not accepted by the Producing Managers Association, explicitly states that the union agrees not to interfere in the selection of any play nor in the casting of it. This being applied means that once an actor is under contract to appear in a piece he must continue in it if the manager demands his services whether his stomach rebels at what he is called upon to perform or not. A case in point bearing on this particular situation is the action of two well-known leading actors leaving the cast of a new musical show, which is to open shortly in Manhattan, because they could not stand the environment of the company, the nakedness of the women, and the general filth of the show itself. If the agreement just ratified by the actors' union were now in effect, these men would be obligated to keep on in the show, as long as the management required their services. The union would be obligated to compel them to remain under the section of the agreement above quoted, or be accused of "violating the sacredness of contracts."

The non-interested members of the jury list, the laymen so-called, being made up of those who are not averse to a little publicity (and the chance to pop into the limelight to the envy of their fellow commuters) might reasonably be expected to be both spineless and voiceless.

The newspapers are against all censorship, though anyone who knows anything about the running of a newspaper realizes that not a day passes that some sort of censorship is not exercised either by the business office or the editorial room. The original censor must have been a blue pencil. The Manhattan dailies have consistently fought all efforts to establish a censorship for motion pictures, for clean books, and for the theater. Presumably their position is colored by the conviction that they will be next in line for the fumigators when the films and the stage have been cleaned up. Under the circumstances it is not strange that they are squarely opposed to a legally established, punitive or corrective tribunal conducted in the interest of general morality.

Season's Plays Outrageous

BUT like bad little boys, who return to their mischief when the threatening rod has been laid away in the closet, the theatrical producers this season have launched a series of plays so outrageous that poor old Public Opinion has staggered to its feet to make a fight of it.

"Artists and Models," a musical show, whose nudity startled even blasé Manhattan, opened the ball and has been followed by others of varying degrees of nastiness. A gesture of correction was made by the police in the direction of this presentation but it was so feeble that even those who would like to see the theater made safe for visitors had to laugh. Strange to say, the outcry against the indecency of the show, which is universally admitted, came not from Manhattan but in the shape of a blistering newspaper attack from Kansas City. Papers in the hinterland of Manhattan took up the fight and after a month a solemn visit was paid to the theater by a police official. By pure accident, of course, he appeared after the opening scene, which is the worst thing Manhattan has ever seen, and contented himself with ordering out of the dialog certain lines which in comparison with other matter in the entertainment were as innocuous as a baby's kiss. By purer accident still, everyone connected with the show knew that the official visitor was expected and the performance for that evening was literally "under wraps." Naturally business at "Artists and Models" has been at the very peak of capacity and the envy of other producers at fever pitch.

Then came three or four plays which outdistanced all previous efforts in the way of rawness, profanity, and "frankness of expression." Broadway held its breath waiting for each successive première, not knowing what limits of freedom it would reach. First nights have never been so well attended as at present. All the wiseacres want to be on hand to see the production before the cleaner is called in. One show tries to be a little broader than the one immediately preceding it. In fact the impetus to "free" speech has been given such a shove that the spirit has attacked stage directors of plays which, in their original form, are quite harmless. There was money to be made out of dirt so the producers went out and bought coal passer's scoops. But at least one healthy laugh has been stirred out of the miasma.

What They Call "Virility"

A PERFECTLY innocent drama was in rehearsal and was progressing fairly, when one morning the director, who by no stretch of the imagination could be characterized as "red blooded," called the star actor and actress into an important conference. "This play needs more virility and popular appeal," he began. "All the plays which are Broadway successes have strong and vigorous language and I am going to inject some of that into the dialog of this one. Now Mr. .... in the scene where you choke your wife just before you leave the house for the climax of the third act, I want you to say 'damn.'" The funniest part of the story is that it is true.

The shadow of the Society for the Suppression of Vice presently loomed large against the bright lights of the Great Shine Way in the person of John Sumner. Mr. Sumner is not a vigilant observer and a courageous attacker but he knows how to fight. When Mr. Sumner goes on the warpath there is no scarcity of action. Mr. "Big Bill" Tait, erstwhile sparring partner of Mr. Jack Dempsey, once remarked of the champion, "Man, when he hits, he HITS." When Mr. Sumner hits he wallops.

Complaints had been made both to the police and the Vice Society about the plays which were being given and Mr. Sumner got busy. There began talk about revoking the licenses of the playhouses involved and that dragged the Commissioner of Licenses, Mr. Glatzmeyer, into the foreground. Mr. Glatzmeyer seemed unable to remedy the situation so someone hauled the "volunteer jury" plan out of its slumbers and tried to shake it awake. Before that doubtful action succeeded Commissioner Enright took the matter into his own hands and without further ado appointed his committee to look over the theaters and disinfect them. The "volunteer jury" had specified that complaints must come from "legitimate" sources. That was presumed to bar out the industrious press agents who have time and again worked up a successful under-cover agitation against a dying play on the score of its indecency. Mr. Sumner is barred as a "legitimate" complainant by Commissioner Glatzmeyer (according to the *Times*) presumably because he knows what he is talking about and his business is to prevent vice. No one of even slightly mottled motives can be considered a "legitimate" kicker. Only amateur crusaders need apply to the "volunteer jury."

Mr. Enright, however, being a policeman himself, is more ready to listen to his un-uniformed brother, Mr. Sumner, than Mr. Glatzmeyer is. He knows that Mr. Sumner knows what he knows. Besides, the police commissioner says, "It is merely a question of common sense and everyday morals." He refuses to have any stuff and nonsense about "art," and "free expression," and "the artistic conscience." Anyone with a normal sense of smell and a pair of working ears can tell whether a play is rotten or not and in view of that fact the commissioner has picked his committee and ordered it to work. What it will do remains to be seen.

At any rate, his action has stirred up a hornets' nest. The newspapers have commented sarcastically on the capabilities of the police appointees to pass judgment on the drama. The point has been raised that, even if the committee reports that a play is putrid and the offenders are arrested, the purpose of the house-cleaning movement will be defeated by the legal appeals, and stays, and all the other machinery of the law which will be called into play. In the interim, say the objectors to the police committee, the publicity will draw patronage to the play. But one producer sent to jail will stop all that. Such a possibility, though, can be entertained by no one in possession of his senses. Manhattan's legal history proves that.

Police Really May Act

AUGUSTUS THOMAS, the mouthpiece of the Producing Managers Association, wants the volunteer jury system. He does not like the direct action tactics of the police commissioner and declares that there is no cause for such summary measures as letting the police in to mop up. It is an inside job, Mr. Thomas is quoted as saying, and should be done from the inside.

Owen Davis, of the Dramatists Guild, prefers the volunteer jury also because it is more "elastic," since out of the panel of four hundred good men and true none is to serve more than once. Both are of the opinion that there are laws on the statute books to handle the problem and that the Commissioner of Licenses has all the power needed to put an end to the nuisance. Both ignore the fact that the Commissioner of Licenses is apparently unwilling to exercise his power and that the police are the very instrument to enforce the law.

The real objection to the police commission is that it may actually do something and that is not to be thought of. The theater must be allowed to remain as it is or get even dirtier, but no one outside it must call for its purification.

That some respectable producers are worried over what may happen to the stage as a whole, is evidenced by the rough-and-ready statements of William A. Brady. Mr. Brady has been a constant opponent of censorship. He has gone up and down the country fulminating against it on every opportunity. He never lets an occasion, however inappropriate, pass without blasting away at his pet aversion. But Mr. Brady is not a fool. He realizes, as do other thinking managers and producers, that something drastic has to be done if the theater is not to fall into utter disrepute and public reprobation.

"The managers are asleep," asserts Mr. Brady with all the vigor for which he is noted. "If they keep on producing the stuff they are doing the law has got to stop it. If the theater and the press, and I couple them together, to sell their product, fly in the face of decency, they must clean up themselves to avoid a censorship. As for the police commission, if it will clean up it will be welcome. Anything that will keep us from committing suicide is helpful. Producers must do the job themselves or someone will do it for them."

Mr. Brady has been through the fight to keep the hands of the censors off the movies. He told the film producers, in season and out, that if they did not stop making indecent pictures the law would prevent their exhibition. Secure in their conceit, the picture producers laughed at him. Then like a bolt from a clear sky came the passage of the motion picture censorship law in New York State and every effort made to repeal, or alter it, has been a failure. Even in the face of that experience it is not probable that the producers will listen to him now. The men who are willing to make money out of the dramatic sewer will continue to do it as long as it is permitted. When they are stopped they will raise the cry of persecution by "blue law reformers."

"No Honest Yeggs Any More; Bad Ones Grow Worse"

In the Old Days, a Promise Once Given, Was Kept, But Now It's Different, Says Protector of Banks

By THOMAS J. MALONE

CHARLES D. BROWN,

Manager of the protective department of the Minnesota Bankers' Association—or, in other words, "yegg" hunter.

"THERE aren't any honest 'yeggs' any more." The paradoxical remark came from a specialist in yeggmen, and his tone was melancholy. For sixteen years Charles D. Brown has been "chief of detectives" for the Minnesota Bankers' Association or, as his title now is, manager of its protective department. In continuous, full-time tenure he is the dean of all "protectors" employed by bankers' organizations in the United States. One of the best informed men in the country on the ways of safe-blowers and "torchers," he believes their level of veracity is lower today than ever before in his knowledge; they are not to be trusted. His views on this and other phases of the "yegg" problem may engage not only, specifically, folks who deposit money and other valuables in banks but all who find fascination in the uncommon activities of the human animal.

"In the old days," Brown laments, "I could count on a 'yegg's' promise, once given, to leave our banks alone, but there's been a great change in the caliber of 'yeggs' in the last ten years or so and today there are few among them whose word is good. I can't account for it, unless by that trite resort—the demoralizing influence of the great war."

Brown's job is to protect banks belonging to the state bankers' association, nearly 1,500 this year, from the operations of criminals. This he does as much by prevention of crime as by detection and arrest after crime has been committed. His constant effort is to convince the burglar fraternity that it is unprofitable to rob a member bank, from a safety and every other standpoint. Knowing scores of criminals personally, he warns them when occasion presents, as when in jail after capture or on release after serving time, against tampering with his charges.

"Yes," he recalls, "there was a time when I could believe a 'peter man'—a nitroglycerin operator—if he promised to keep away from our banks. Today his word—or that of his more up-to-date rival, the gas torch user—is likely to mean nothing.

"Take the case of 'Wisconsin Max,' a chronic safe-blower. Max has served several terms in prison. When he got out about ten years ago from doing a turn, he came to see me. I had been party to sending him up and he was in contrite mood, wanted to talk things over and seemed anxious to be friends.

"That was all right with me. When a man does his time and is released, the slate is clear as far as I'm concerned and I'm ready to start over again on even terms if he'll promise not to fool with the banks that hire me.

"Max told me he had learned his lesson and would never again touch a bank showing the membership sign of the Minnesota Bankers' Association. I had known old Max for years—that last had been his third term—and I sort of believed him, looked for him to give us no more trouble.

"Yet hardly a year later he was one of a gang that blew the safe in the Scandia State Bank at Scandia, Minnesota. After the arrest, I waded into him for having broken his word. He insisted that he hadn't known he was breaking it, that it had been a mistake.

"'Honest,' he said, 'when we got inside I flashed the "bug"'"—your bank "yegg" is sometimes a poet, and a flashlight makes him think of fireflies—"'to see if the sign was around, but it wasn't. So we went to it. Wouldn't have touched the job if I had known it was a member bank.'

"I didn't believe this story, but I learned later from officers of the bank that the 'M. B. A.' sign actually had not been up the night of the burglary. It seems that cleaners working in the bank the day before had taken down the sign and neglected to replace it.

"Yet I've always suspected that old Max was quibbling."

It was in connection with this Scandia bank attempt—the burglars got only $1—that Brown proved the value of an intimate acquaintance with the crook gentry and their personal habits, even their mannerisms. Reputed to have a peculiarly acute sense for remembering names and faces—to be unfailing in ability to identify the owner of any of the several thousand faces in the rogues' gallery of photographs gathered for his department—he goes beyond that to storing up facts about personal traits, singularities, associations, of criminals who make a specialty of robbing or swindling banks.

So far as bank officials, the town marshal and the sheriff's forces could see, the burglars at Scandia had left no clew. They had gone hurriedly, frightened away probably by some outside noise before finishing their work, but no forgotten tools, no foot nor finger prints, were found to give the authorities something to mill over.

As his custom has been always, Brown went to the scene of the burglary, looked the ground over and talked with the bank folk. No, they hadn't noticed anything enlightening in the appearance of the bank quarters after the "yeggs'" visit. Some of them must have been excessive tobacco chewers, though, for the bank floor, from the window by which they had entered to the vault door, had been found littered by expectorations. It looked, in fact, as if the world's champion tobacco spitter had been trying to beat his record. They had had the floor scrubbed at once.

Brown smiled, but said nothing. He had heard some such story in connection with the robbery of a railway station in a neighboring town not long before—the station room and platform had been vile with tobacco spit.

Back in Minneapolis, his headquarters, he sent for one of his "cover men"—go-betweens who keep him informed of the whereabouts of bank crooks at large and of their plans.

"Where is 'Chi Tommy'?" he demanded.

The cover man knew and told. "Chi Tommy"—the "Chi" for "Chicago"—was temporarily resident in a place called "The Shack," over in St. Paul.

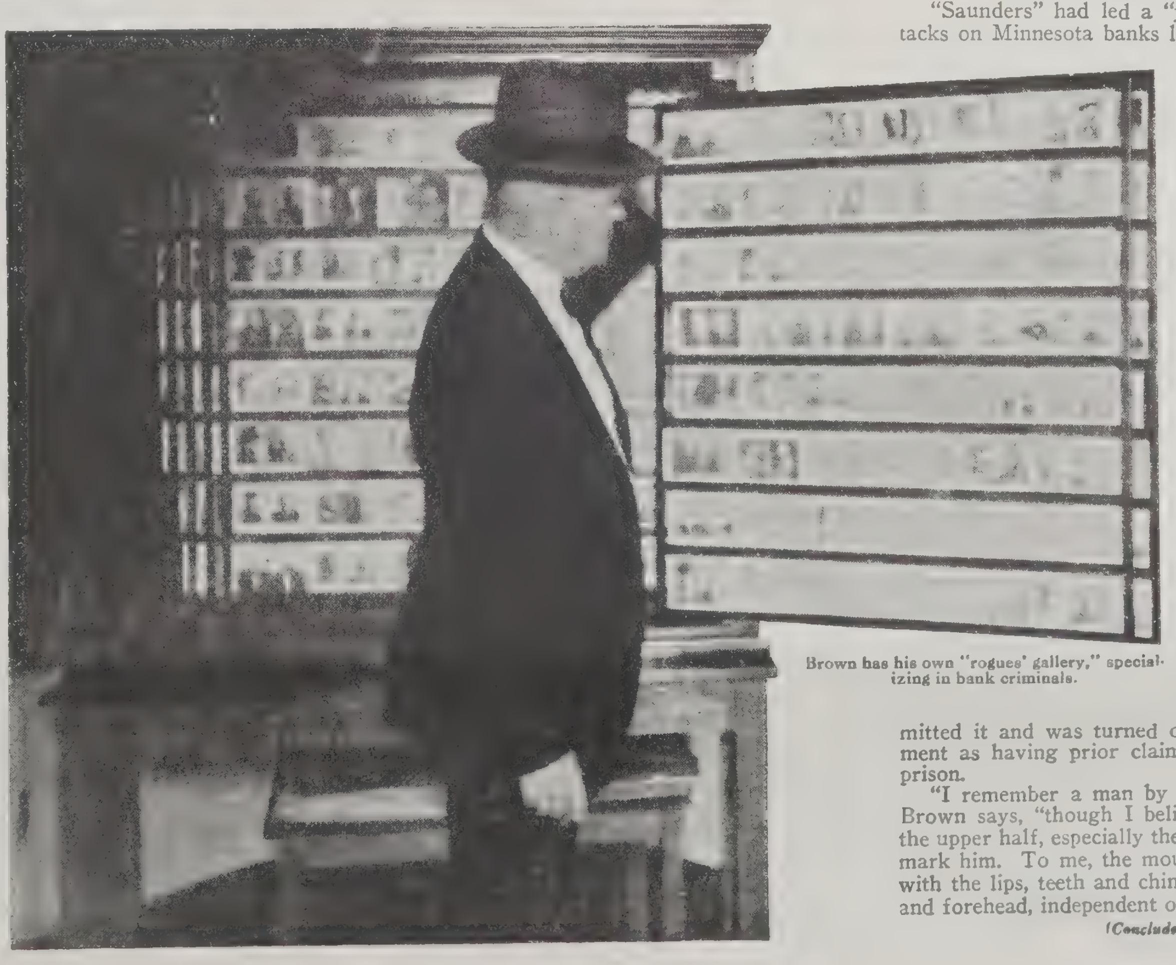
Brown and a friend went to the place, armed, and gathered in both Tommy and—you'd never guess—"Wisconsin Max." They admitted participation in the Scandia affair. What else could they have done, for hadn't Brown had the goods on them?

"I had known 'Chi Tommy' only in a general way," he explains, "for while he had operated in Minnesota before, it was not against banks. Tommy's tobacco-chewing habit is what made me remember him. He always had a chew in his mouth, it seemed—a large one that bulged out his cheek. He must have chewed tobacco in his sleep. What he did at meals, I don't know. Look at this picture of him in our gallery, taken a dozen years before that Scandia job. You see the bulge. Now if any one could chew tobacco 'like a gentleman,' Tommy wasn't that one. He not only chewed constantly, but he sought relief disregardfully, disgustingly. He left a telltale trail. I think I'd know him by it anywhere in America.

"That's why Tommy went to the state prison at Stillwater, along with Max, for the Scandia affair. When he got out, he, too, said he was 'off' Minnesota banks for good. I suspect he was. He's now doing thirty years in Waupun for a bank robbery in Superior, Wisconsin."

Not every one has a memory for faces, and the lack of it has been cause of regret and embarrassment to many. Brown has developed such a memory by years of painstaking effort. You may think nothing about the casual stranger who accosts you in the street for the time of day or a match, jostles your elbow in the theater window line-up or talks the weather or politics with you in street car vestibule; but with Brown the scar on his left temple or the deep lines around the mouth may call up one of the pictures in that gallery of "criminals I have known." The incident of "Saunders" illustrates this knack of identifying.

"Saunders" had led a "yegg" gang in numerous attacks on Minnesota banks last year and was recognized as an exceptionally dangerous gas torch operator. Police in an Iowa town captured him on information furnished by Brown and the latter went down to identify him. Brown had never seen the man. When he did see him, his mind began sorting out those gallery pictures and came to rest, confidently, at one. But he knew that the man who had sat, unwillingly, for that picture, was dead. Saunders couldn't be that man. Yet there was a resemblance, strong, unmistakable. Then he recalled that he had heard a brother of the man of the picture, going under a wholly different name from "Saunders," was wanted by Federal authorities for part in a mail robbery in Ohio. This must be that brother. The torch man admitted it and was turned over to the Federal Government as having prior claim. He is now in a Federal prison.



Brown has his own "rogues' gallery," specializing in bank criminals.

"I remember a man by the lower half of his face," Brown says, "though I believe it is generally held that the upper half, especially the eyes, will more distinctively mark him. To me, the mouth and the lines around it—with the lips, teeth and chin—serve better. I think eyes and forehead, independent of deformity or scars, are far

A Modest Shrine to Liberty on Kansas Plain

Beecher Bible and Rifle Church Marks Settlement of Free-state Pioneers

By C. E. ROGERS

WABAUNSEE, or Dawn of Day, name of a Pottawatomie chief, stands as a whistling post on Rock Island, one hundred miles west of Kansas City. To the motor tourist who speeds through Kansas on the Golden Belt or the Midland Trail it is a forlorn-looking country village, with a store, a blacksmith shop where simple automobile repairs are done, a cluster of a dozen or so dwellings, a country school and several churches.

Wabaunsee, a name which three-quarters of a century ago was on the lips of all who loved liberty, is a modest shrine. There is no brazen commercialism about the sacred significance of it. Wabaunsee treasures its tradition born of liberty-loving forbears, but it treasures it in the spirit of those who created it, modestly, with a dignified detachment.

That is why the tourist speeding through the country misses one of the most interesting historical shrines of the nation—the Beecher Bible and Rifle Church, situated in this barren little town on the Golden Belt. The "Beecher" church stands a quarter of a mile off the main road, in what was originally planned as the residential section of the city of Wabaunsee. It is the third oldest Congregational church in Kansas, a sturdy little stone structure, seeming to symbolize the strength of character of those who laid the stones of its walls.

One may gain entrance to the building by requesting the use of the key from a retired minister who lives in the village. Arriving inside a small frame vestibule, evidently a later addition to the church, one passes through a door into a hallway, and through this, to the main auditorium of the church. The hall is underneath an old-fashioned balcony. For thirty-odd years A. A. Cottrell, one of the founders, met in this gallery a Sunday school class composed of young men. The church furniture is that of the founders, the pews of the style of early New England churches, family sized, grouped upon either side of two aisles which divide the floor space into three sections.

The story of the Beecher Bible and Rifle Church carries one back to the stirring time when Kansas was the battleground of freedom in the nation. Those who established the colony were "pioneers of towns and cities, the seed of Christianity—the germs of civilization." They came to Kansas with one purpose uppermost—that of making Kansas a free state.

One of the best chronicles of the Wabaunsee colony is that written by the Rev. Sherman A. Willard, son of Julius F. Willard, one of the founders. Both the father and the son, chronicler of the colony, are now dead. Funeral services for the latter were held in the Wabaunsee church last Memorial Day when relatives and friends, sons and daughters of the founders, gathered from far and near to pay their respects.

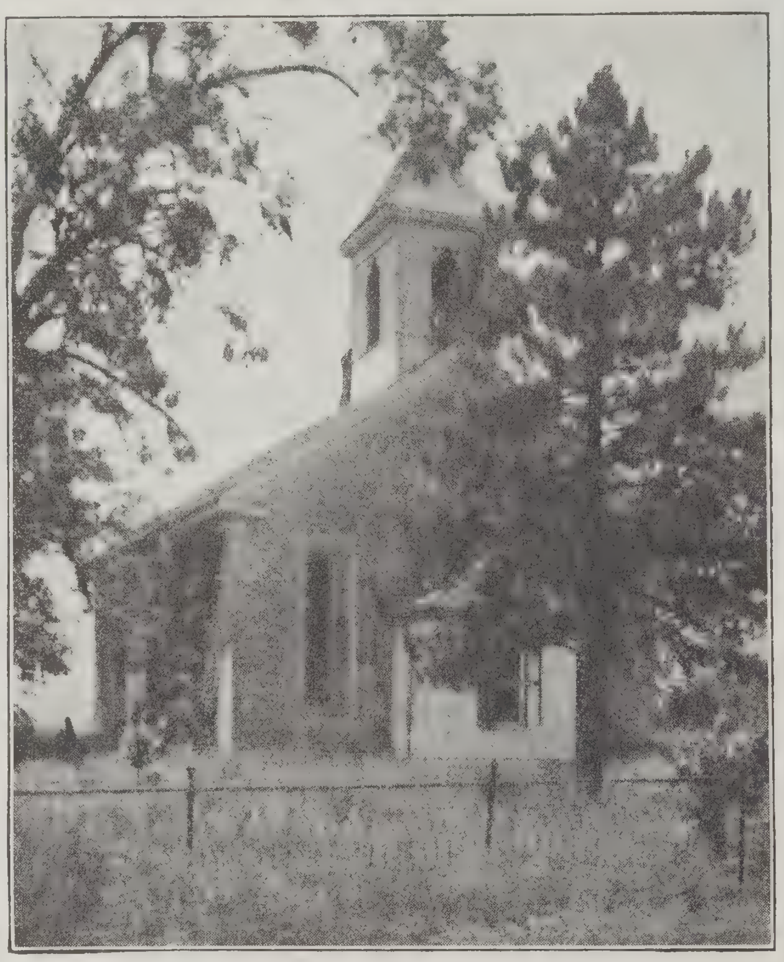
"The Connecticut-Kansas colony was formed in New Haven in the winter of 1855-56," the Willard account relates. "It was backed by the best men in New Haven and the East. Its purpose was to settle in Kansas to help in the free state struggle there and to found homes after the New England ideal. February 17, 1856, Charles B. Lines announced the formation of the company. Within a week eighty-five names were signed. By March seventh this number was increased to ninety. On that day Mr. Lines was chosen president.

The colony left New Haven the night of March 31, 1856. That evening a farewell meeting had been held in Brewster's hall. March 22, at a meeting in the North Church, Beecher and others had pledged the rifles with which the men were armed, and a few days after that meeting, A. Studwell, a member of Beecher's church, gave the funds for the purchase of twenty-five Bibles."

Beecher himself was not present at that last memorable meeting held in Brewster's hall March 31, 1856, but he gave the colony its charter in the form of a letter read by the Rev. Dr. Bacon. "The letter was a masterly production, full of vigor, beauty, courage, strength, and truth," remarked the New Haven *Palladium* in its issue of April 1, 1856. The letter in full, as reprinted in the New York *Daily Tribune,* Friday, April 4, follows:

C. B. Lines, Esq.,
New Haven, Conn.
Dear Sir:

Allow me to address you, and through you the gentlemen of your company, on the eve of your departure for Kansas. I hope and believe that you will find a settlement there to be a means of great personal prosperity. You are not like the early settlers of New Haven, going upon a doubtful enterprise, to a poor soil in a severe climate, the ocean on one side and the wilderness of a continent on every other side. You will not go far from us. In our day, we measure by time, rather than distance, by hours, not miles. You will not be as far from your old home as one Sabbath is from another. And yet you go upon an errand not one whit less Christian and less heroic than that of our common ancestors, who founded New Haven. You are pioneers of towns and cities; you are the seed of Christianity—the germs of civilization. You'll put your feet down in a wilderness, in a year it will be a populous place. And where the morning sun now rises upon herds of wild buffaloes couched deep in wild grass, in your own lifetime it will bring forth the cry of multitudes and the noise of a city. Nevertheless, such perils have been coiled about the young state of Kansas that it is an act of courage to settle there, if a man goes with a true spirit of American institutions. To go there determined to transplant to its soil that tree of liberty, which under God has in older states borne and shook down from its boughs all the fruits of an unparalleled prosperity, requires heroic courage. It is a pleasure and honor to us to be in any way connected with such an enterprise by furnishing to the emigrant material or moral aid. I have personally felt a double interest in your company, because it springs from New Haven, my father's birthplace and home of my ancestors. A friend and parishioner (A. Studwell) desires me to present to you twenty-five copies of the Bible. This is the charter of all charters, the constitution of all constitutions, the source and spring of Christian manliness. This book will be at the foundation of your state. It will teach you to value your rights, and inspire you to defend them. The donor has caused to be inscribed upon them: "Be ye steadfast and unmovable." It is a shame that in America, amid our free institutions, anything else should be needed but moral instrumentalities. But you do need more. You will be surrounded by men who have already committed the wickedest wrongs, and the most atrocious crimes. They have scrupled at nothing by which slavery may be fastened upon the young state. To send forth companies of men with their families, amid those who have been bred to regard helplessness as a lawful prey to strength, would be a piece of unjustifiable cruelty. I send to you therefore, as I promised, the arms required for twenty-five men. I have not the least fear that a hundred men bred under New England influences will be too eager or too warlike. You have been taught to create wealth, and not to rob it; to rely on intelligence and rectitude for defense. And you will not be in any danger of erring on the side of violence. But you are sent for the defense of great rights. You have no liberty to betray them by cowardice. There are times when self-defense is a religious duty. If that duty was ever imperative, it is now, and in Kansas. I do not say that you have barely the right to defend yourselves and your liberties; I say that it is a duty from which you cannot shrink, without leaving your honor, your manhood, your Christian fidelity behind you. But this invincible courage will be a shield to you. You will not need to use arms when it is known that you have them, and are determined to employ them in extremities. It is the very essence of that spirit which slavery breeds to be arrogant toward the weak, and cowardly before the strong. If you are willing to lose your lives, you will save them. If, on the other hand, you are found helpless, the miscreants of slavery would sweep you from Kansas like grass on the prairies before autumnal fires. If you are known to be fearless men, prepared for emergencies, slavery, like a lion, will come up, and gazing into the eyes of courageous men will stop, cower, and creep away into ambush. I trust that the perils which a few months ago hung like a cloud over that fair state, are lifting and passing away. May you find an unobstructed peace! Then, let these arms hang above your doors as the old revolutionary muskets do in many a New England dwelling. May your children in another generation look upon them with pride and say, our fathers' courage saved this fair region from blood and slavery. We will not forget you. Every morning's breeze shall catch the blessings of our prayers, and roll them westward to your prairie homes. May your sons be as large hearted as the heavens above their heads; may your daughters fill the land as the flowers do the prairies, only sweeter and fairer than they.



The Beecher Bible and Rifle Church, Wabaunsee, Kansas.

I am in the bonds of the Gospel and in the firm faith of liberty truly yours,

(Signed) H. W. Beecher.

The Willard chronicle tells of the departure from New Haven, the trip by boat to New York, then by ferry to Jersey City. There were approximately seventy persons who finally set out for the West, taking the train as far as St. Louis and a steamboat thence to Kansas City. In the party were four women and two children, all the rest being adult men. They were mostly city men, tradesmen, music teachers, tutors of Yale College, politicians, and preachers. Few had been farmers or wanted to be. As a whole they were not naturally adapted for pioneer life or good material of which to make farmers.

Several days were spent in Kansas City buying oxen and equipping a wagon train. They proceeded by wagon, hack, and by foot, to Lawrence. Here they were met by pioneers sent ahead to find a location. At Wabaunsee on April twentieth the entire company camped on the east side of Antelope Creek.

Here the settlers found their land and built their homes. A Congregational church was organized June 28, 1857, but it was not until May 24, 1862, six years later, that the present stone church was dedicated, "some members of the colony having left their own homes unplastered that the walls of the house of God might not remain bare," according to the pastor, the Rev. W. A. McCullom, in his dedicatory address.

Years of hardship and deprivation followed the founding of the "New Haven of the West." It was a raw country, with hostile Indians menacing the settlers on the one side and border ruffians an ever-present danger from the other.

"It will be well to remember that at this time the President of the United States, the Secretary of War, and every territorial officer were doing all they could to make a slave state out of Kansas," Mr. Cottrell writes in his reminiscences.

"I built a house by putting a sixteen-foot pole in two forks set deep in the ground; ten foot rails, one end of the rails on the ground, the other end on the pole. These covered with prairie hay, then dirt on the hay, made the two sides of the house. The north end had a large fireplace built of prairie sods. A bed tick split in two and fastened to willow poles, made an excellent door on the south end. This made a warm, comfortable house for winter and a good harbor for snakes the next summer. Many times as I was taking my noonday rest on my bed in the heat of the day, I saw different kinds of snakes crawling over and under the rails above my head. My place was so near an island that had good house logs on it that it was not long before S. H. Fairfield, S. R. Weed, J. E. Platt and J. F. Willard came to live with me, so as to be near the timber on the island. We were all making rails to fence our claims. Each one furnished his own bed and food. The cooking was done in the sod fireplace. The standard for a good cook was to be able to cover the bottom of a frying pan with batter, then turn the cake without knife or fork by giving the frying pan a flip, bringing the flapjack bottom side up in the exact spot in the frying pan that it was at first. If by any means it landed in the ashes it was eaten all the same. Four of these flapjacks soaked in one or two spoonfuls of bacon grease and four generous slices of fried bacon rolled up in those cakes made us an ideal dinner while making rails, provided they did not become frozen so hard that we could not bite through them all at one bite. When the cooking utensils were shoved under the eaves and we were all in bed on the 'ground floor,' the house was full. When one fellow wanted to turn over in bed the rest had to turn over or get mixed up with our grub and dishes.

Several of the Wabaunsee homes were stations on the "underground railway," the pre-war organization for aiding runaway Negro slaves.

"The dreams of the town founders were not all realized," the Willard narrative concludes. "We have a second New Haven in spirit but not in size."

That was written fifteen years ago and Wabaunsee has changed but little. It probably never will be anything but a village on the Golden Belt highway to thousands of tourists. But the Beecher Bible and Rifle Church will continue to symbolize the "seed of Christianity—the germ of civilization."

Mr. Ford's Page

WE ARE probably right in regarding the radio as the highest point of refinement and precision in all our mechanical methods of communication. Its development has been perfected until now it leaps over seas and binds continents together. What the sailing ship did in six months, the modern steamship in six days, the ocean cable in a matter of minutes, the radio now accomplishes on the instant.

But greater than radio is language. At best, any method of communication is but the servant of language. Speech itself is a product of man's need to do things, to get things done, to fulfill wants, to co-operate. Language is one of the basic tools in the business of living and developing the earth. And it is the *business* of life that has brought into existence those auxiliaries of speech —telephone, telegraph, radio, and indeed all the other aids to communication which exist today.

There is, however, something more than that. Speech, marvelous as it is, does not reach its fullest glory save in a unity of language. If there had been no large section of the earth using the same language, certainly all of these modern devices would have remained mere scientific toys. It is a singular fact that the practical development and world-wide use of these instruments of communication have been the work of one section of the world—that section which represents the largest block of language unity. The human checkerboard of Europe, where the language changes every little distance, sometimes oftener than even the customs frontiers change, which is often enough, has not perfected for general use any of the modern speaking devices just because of this lack of language unity.

Difference in language indicates a difference in thought, in ambition, in method. Difference in language hinders science and invention and commerce, just as it hinders world peace and understanding. Language leaves its mark on everything, and you can readily see it in government and mechanics. It is possible for an engineer to tell what language a machine was built in, just by looking at it. Indeed, there are some languages in which you cannot build a machine at all. There are some languages in which you cannot successfully run a factory.

So that the question is not only language, the question is *which* language and its *extent*.

If the world today has one dominant trend it is because the world is approaching a dominant language. And that is the English language. Some people foolishly object to that statement because they fancy it is part of some subtle pro-British propaganda; they associate English language somehow with English Government. It is well for such people to know, however, that there was an English language before there was an England. There is nothing political nor geographical in the use of the term "English language." It comes about as near being universal as anything which we have in this world.

If there were no English language, the greatest republic and the greatest empire in the world would have been impossible, and in their places would exist a hopeless, futile chaos of little factions. There would be no unity of opinion possible in the world, no large expression of definite human ideals. There would be no strong drive toward peace and prosperity and progress—three elements which accompany the English language wherever it goes. Wherever you find the English language, you will find certain fundamental liberties in existence or being brought into existence. This is the whole secret of the colonizing power of the language—it bears with it elements that tie men and communities together in a bond of principle.

Take industry for example. It is undeniable that where industry is run by the English language it is a different kind of industry with a different kind of spirit than can be said of industry which is administered through any other language. The type of industry that sets the pace for the world, and supplies ideas to the world, and fills the major part of the world's industrial needs, is the industry that has been developed under the clear, adaptable, forceful language which is used by the dominant portion of the industrial world. This is not mere accident. It is not as if the same men could have done as much in another language, or in a mixed variety of languages. For a reason which may be fully discovered some day, the very speech itself was one of the fundamental ingredients in the achievement.

The industry of the backward nations, insofar as it has been developed, is an imitation of the industry of the nations which use the English language, but because of the language barrier those backward nations are imitating our mistakes rather than our best successes. The things which have become obsolete with us are the things they have picked up. This is one of the tragedies which result to the world because it lacks language unity.

The English language, we are told on every hand, is rapidly becoming the world tongue. This is not due to any extraordinary efforts made to spread it, for it has a way of spreading itself. It is willingly adopted on merit, for the sake of its usefulness, because the world becomes increasingly full of things that must be done in English if at all.

Prosperity has a meaning in English that it does not have in any other tongue, and you have only to attempt to sow some of our most commonplace American industrial ideas into the minds of foreigners who use another tongue, to discover how different are the very bases of thinking. You may converse with industrial leaders from every country in Europe and discover that to them prosperity means only the prosperity of the employer. Their employes?—why they look at you in amazement! Pay the women as high wages as the men?—they scrutinize you to see what kind of an American joke you are working off on them! They are always looking for a market outside of their employes. Never do they consider making their employes prosperous enough to become possible purchasers of their product. In Germany the hope of prosperity is that somewhere else in the world there is a working class prosperous enough to buy what the German working class has never been prosperous enough to buy. Prosperity to the German worker does not have the same meaning as it does to the English-speaking worker.

The world needs prosperity in the English-language meaning of the term. It needs opportunity as defined in English. Any other definition falls too far below the level of human rights. The dollar would never have been high were it not that American ideas of justice to the other man were high too. We have made mistakes, we have too often fallen below our best, but there is this to be said, namely, that the worker and the woman and the child know more of the blessings of life in America than in any other land. It is because our definitions of the elements of life are worked out in the English language.

It is not good, however, that one or two nations should forge so far ahead of the rest of the world. It is not good for the balance of life. And this is one of the causes for gladness that the English language is spreading over the earth and among all the races of men; it is going to serve as a great power to restore the balance of the world, to put all the nations in more equal relations one with another. It is not expected, nor would it be desirable that all the nations and races shall excel in the same things, but each shall be enabled to bear a more equal part in the entire world job of providing humanity with its daily bread and all the commodities necessary to a satisfying standard of life.

SPEECH is one of man's most marvelous tools, and there is a direct relation between the kind of speech which he uses and the kind of work which he does. A good and experienced engineer can tell what language a machine has been built in, just by looking at it. There are some languages in which a machine could not be built at all. There are languages in which it would be impossible efficiently to manage a factory. The English language is the world's tool in industry, colonization, and the bringing of prosperity to every kind and degree of men. It is the World Language. The world accepts it because justice, freedom, prosperity and opportunity have higher meanings in English than in any other tongue. The more we promote language unity, the nearer we bring to the world the things which mankind needs.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Starving Children Calling

DISPATCHES from American newspaper correspondents in Germany picture the sky of Silesia aflame with the reflection of thousands of burning farmhouses and barns. Innumerable bands of unemployed from towns and cities plunder the smoking houses and drive off the live stock. Rifles of the police spit fire and lead at the plunderers homeward bound. Communists, Separatists, anti-Separatists, police and peasants fight and loot.

Amid all these conflicting forces and confusion the children of Germany should have the sympathy of the world. We, in America, have never been forced to depend on other nations for sustenance for starving children.

Major General Henry T. Allen, chairman of the American Committee for the Relief of German Children, and the officer in charge of the American Army of Occupation in Germany, has this to say of the situation:

> "Since we announced the organization of the American Committee for Relief of German Children, we have received telegrams, letters and newspaper editorials from all parts of the United States indorsing this emergency appeal to all Americans.
>
> "I accepted the chairmanship of this representative American committee because my experience as head of the American representation on the Rhine for four years and my observations during a recent visit to Germany convince me that starvation faces Germany's undernourished children this winter. Under these conditions it seemed imperative for me to act.
>
> "This committee will make a nation-wide appeal for funds and the American Society of Friends (Quakers) will have exclusive charge of the feeding.
>
> "As there is such keen interest throughout the United States in this undertaking we should like to have every editor know that we shall be glad to give him, or any local committee, the fullest information in regard to the need in Germany and our program for this humanitarian work.
>
> HENRY T. ALLEN,
> "Chairman."

"How does it happen?" General Allen was recently asked, "that you, a commander of American soldiers in Germany, are heading this committee to feed German children?"

The General answered:

"America never waged war on children."

A Taxation Fable

YEARS ago, when magazines were a luxury and the family subscribing for *Harper's* sent it around the neighborhood, a lad saw an illustration, in which a savant was depicted as gazing at a calf's tail hanging from an augur hole in a tanner's doorframe. The text read: "Now I wonder how the calf got through that small hole."

The lad took it all as an actual occurrence, and told his mother that any boy would know the tanner had cut the tail from a hide and stuck it in the hole, that the calf didn't go through the hole at all.

The tale was brought to mind by a dissertation on taxation in a recent feature article by Dr. Frank Crane, who enjoys a large income from the sale of the product of his brain and pen. Among other things he says:

> "Everybody knows that the value of stocks has decreased by millions of dollars during the last year. That means that the public is holding off from putting its money into those industries that employ labor and make the country prosperous. The income tax, therefore, is the enemy of labor and the cause of depression and unemployment."

If that isn't a word picture of the philosopher after satisfying himself how the calf got through the augur hole, what is it?

The market value of stocks is of no interest save to those gambling in them and perhaps some investors anxious to sell. The immense losses or gains in market fluctuations are merely the shifting of wagers between stock speculators and rarely represent any deal in actual shares or any change in ownership.

That the income tax is therefore inimical to labor does not follow, while at least one postulate of the doctor is exploded in the fact that there is less unemployment than when stocks were having a boom some months ago.

Technicality Frees Murderer

CHICAGO reports a dismissal of a murder case which seems a travesty on justice. The State was able to prove the defendant killed a man in jealous rage. It was not a case of circumstantial evidence, but where the crime was proved beyond a doubt. Discharge of the prisoner followed failure of the prosecution to prove the victim ever lived.

Only three witnesses of the crime knew the murdered man. These were the murderer, who refused to testify, his wife, whom the law does not permit to take the stand, and a brother of the dead man, who has mysteriously disappeared.

Here is a technicality which does not seem to warrant the reasonable doubt which protects a suspected criminal from conviction on circumstantial evidence. The man was shot and killed and his assailant was proved guilty, but because the State could not present a legal witness to the fact that the victim ever lived, the magistrate felt it his duty to free the man who was charged with the crime.

Truly, as one jurist has said, it is difficult to commit a legal crime.

Are You "Stamped"?

THE country has been "driven" to exasperation—charity drives, community drives, dozens of altogether maddening efforts to buttonhole us, and let no man, woman or child escape.

But at Christmas time, the season of good will and good cheer—the antithesis of disease—we welcome most heartily being "stamped" by the Society for the Prevention of Tuberculosis. Our Christmas packages would lack part of their charm if the neat little tuberculosis stamp were missing.

In the first place, no cause is nearer the heart of the average American than that of stamping out the White Plague. That is the dragon with which we have been coping for years, and he just now shows signs of losing breath. It is to our interest to lend all our weight against him, lest he get a second wind. And one of the pleasantest ways we have of lending our bit is by buying and using these tuberculosis stamps, thereby definitely contributing our mite and making known that we endorse and support the cause.

Each year has seen this "stamping" custom become more widespread, and each Christmas has correspondingly seen a new and altogether attractive design on the stamp. This year's shows Santa's smiling face appearing in the fire before an expectant child, and the ever-present tuberculosis cross.

We experience a singular pleasure when we find packages from all parts of the country bearing this insignia of twofold significance: a coat of mail in the fight against tuberculosis, and the cheering Christmas wish that it brings.

No other cause can with equal appeal usurp the place of the tuberculosis stamp; likewise no Christmas mail is quite complete without it.

Another Subsidy Scheme

THE National Merchant Marine Association, of which Senator Joseph E. Ransdell, of Louisiana, is president, presents a new subsidy scheme. Senator Ransdell, it will be remembered, is known more as the proponent of the subsidy idea than for any other accomplishment in the line of his duties as representative of a commonwealth in the Upper House of Congress.

Having failed to secure the direct subsidy proposed in the last Congress, the National Merchant Marine Association now proposes to turn over to the ship owners a large part of the revenue derived from customs duties. That is, so far as the suggested plan becomes operative, the protection of American manufactures will be nullified or the tariff handed outright to those who ship in American bottoms. Under the plan Government would issue to American exporters and importers certificates representing a fixed percentage of the value of the goods exported or imported in American ships, if the latter are free of duty. These certificates are to be transferable and negotiable, and good at face value for the payment of any customs.

To illustrate the working of the plan, suppose the percentage be fixed at five. On a cargo worth $100,000 the certificate would be $5,000, worth its face to any importer of dutiable merchandise. If an exporter is also an importer, he could use the certificate to release his own imports. If it exceeds such duties he could transfer the certificate, realizing the excess in cash, and if it did not cover the amount of duty he must pay it would be received as cash toward that amount.

The argument in favor of the plan is intended to convince the manufacturer, the merchant and the farmer that the benefit will, through economic law, work back to the users of raw material, the retailer and the consumer, but a little thought must convince one of its sophistry, for the certificates, being equivalent to a direct subsidy, can benefit nobody but the ship owner; and his benefit will be discounted if established foreign lines meet the increased competition by reducing transportation costs.

The burden will fall, as every burden falls, on the people, and there will be no relief for the consumer unless competition reduces prices.

A Right Merry Christmas!

THE spirit of radiant good will, of cheer and happiness—that is Christmas. If it is anything other than that, ours is the blame.

It has become a welcome custom to remember all our friends at this time. The bearer of our message is of minor importance; the actual good will with which it is sent is all-important. It is essential that we remember at all times, with Sir Launfal, that "The gift without the giver is bare." We send merely a token to share our happiness. To violate this spirit by extravagant or mercenary motives kills all that is finest and noblest about our most glorious season.

It has also become a custom, a beautiful custom, to "be our brother's keeper" more than ever at this season, and to see to it that no person, rich or poor, is forgotten. Municipal trees and exercises are coming to be more popular year by year. We are translating into our changed life of today the old, old Christmas of the carols, when

All you that to feasting and mirth are inclined,
Come, here is good news for to pleasure your mind,
Old Christmas is come for to keep open house,
He scorns to be guilty of starving a mouse.

The holly and ivy about the walls wind
And show that we ought to our neighbors be kind,
Inviting each other for pastime and sport,
And where we best fare, there we most do resort.

Who Profits by Destroyed Currency?

A CORRESPONDENT in Louisiana asks who benefits when a silver certificate is destroyed.

Naturally, a certificate being the representative of a silver dollar in the Treasury, the Government will hold the coin in the end, as a destroyed bill cannot be presented for redemption.

The question brings up a matter which is alluded to by reformers occasionally, that of the profit arising from the destruction of other notes. Eventually the issuing authority, government or bank, must be the gainer to the amount of the notes which cannot be identified, and for this reason it is argued that, by direct issue of currency, a considerable sum will be saved to the government. If a National Bank, for instance, goes into liquidation, it would redeem only those of its notes that could be found.

He Didn't Kick It—He Ran—and 'Made' Football

And Ivy-covered Walls of Rugby Bear Testimony to William Ellis' Feat

SEVERAL years ago Sammy White twice came in the path of a bounding football within the space of eight days. Instead of falling upon the ball, as was the habit and custom of the men playing the game at that time, Sammy White picked up the bounding ball and ran across his opponents' goal line. The first Saturday he did this he caused the defeat of Yale and on the following Saturday, when he again picked up a bounding ball and raced across the goal line of his opponents, he brought about the defeat of Harvard. And, just because he picked up a bounding ball and, instead of falling upon it, ran with it, Sammy White remains as one of the football heroes of Princeton University.

On an autumn day in the year 1823 and on the playing fields of Rugby School in England, one William Webb Ellis caught a ball and, instead of following the custom and rule of the game as it was played at that time and retiring back and kicking the ball or placing it for someone else to kick, William Webb Ellis ran with it, straight ahead and across the opposing team's goal line.

The feats of William Webb Ellis of Rugby School and Sammy White of Princeton University were similar. Each grabbed a football and, instead of doing the customary or obvious thing with the ball, ran with it across the goal line. But, while Sammy White remains only as one of the football heroes of Princeton University, William Webb Ellis became the father of Rugby football through his feat.

On November 1, 1923, Great Britain celebrated the one hundredth anniversary of the exploit of William Webb Ellis. There were exercises befitting the occasion at historic Rugby School. The feature of the centenary celebration was a match in which representative players from England and Wales opposed those of Scotland and Ireland. Those of Great Britain who like sport, and nearly everyone in Great Britain does, gave some thought on that Sunday in November to a man whom posterity nearly overlooked.

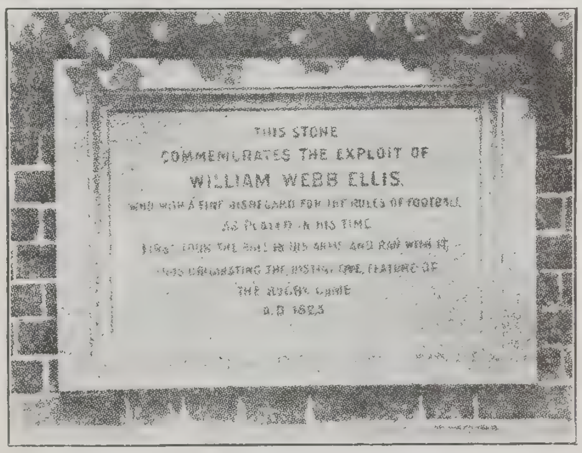
On the grounds at Rugby is an ivy-framed tablet that reads:

This Stone
Commemorates the Exploit of
WILLIAM WEBB ELLIS
Who, With a Fine Disregard for the
Rules of Football
As Played in His Time
First Took the Ball in His Arms and
Ran With It
Thus Originating the Distinctive
Feature of
The Rugby Game,
A. D. 1823

Great Britain was a long time giving credit to William Webb Ellis. Football has been played a long time. Some historians maintain that it was played in the days of the Pharaohs, the Caesars, all the way down through the long lane of history. Ancient cities, excavated and their ruins disclosed, have testified in behalf of the historians. It was football of a kind, but all football is that. No one knows who started the game. It apparently antecedes Christianity by many years and its true origin will never be clearly established.

Years ago a dispute started in England regarding the origin of the game of Rugby and some of the best minds in England became engaged in the discussion. It was all caused by one Sir Montague Shearman, a distinguished athlete, who compiled a book on football. This was published in 1887, and among other things Sir Montague said that running with the ball had always been part and parcel of the game at Rugby School. This opinion, at the time, was shared by nearly everyone else. But there were some veteran followers of the game who did not accept the opinion and raised a point of difference. As a result of the controversy an official committee was appointed in 1895, seven years after the discussion started, to investigate the matter thoroughly. Two years later the findings of this committee were published in a report that contained a mass of correspondence upon the subject together with the committee's findings. It was then officially set forth for all time that prior to 1823 running with the ball was unknown in Rugby football and that in the autumn of that year one W. Webb Ellis undertook "unfair practices" and ran with the ball, an innovation of doubted legality at the time but which gradually became accepted as part of the game and obtained a customary status a few years after introduced by W. Webb Ellis. Running was duly legalized in 1841-42 and finally by the rules of 1846.

From the official report we discover that exactly twenty-three years after the son of old Rugby School ran with the ball this feature of attack was written into the rules but for twenty-three years it had been practiced by other players. The year 1846 was not so far removed from the year 1887 when the discussion started regarding the origin of running with the ball but it required seven years from the time the question was brought up to reach a definite decision. Football is an old game and it develops slowly.



Above—Rugby School from the playing fields. Below—The tablet to the boy who "invented" the game.

As a matter of fact, our modern football game is not so far removed from the game of Rugby football as it was played before William Webb Ellis made his now immortal run. At that time the ball was caught by a player and then, according to the rule, the man who caught the ball retired as far back as he pleased keeping possession of the ball while his opponents could not advance any farther than the spot where he caught it and were unable to rush forward until he had either punted the ball or placed it for someone else to kick, for most of the goals in those days were made by place kicks. The moment the ball touched the ground the opposing team might rush on and try to gain possession of the ball. Ellis, on this occasion, instead of retiring back and punting the ball or placing it for someone else to kick, took a tight grip on the ball and rushed forward, carrying it across his opponents' goal line.

To associate this point of play with college football in the United States: It is similar to making a fair catch and signaling intentions of trying for a field goal. In this play, also, the opposing team cannot advance until the ball has been put into motion.

The University of California's crack football championship team a few years ago worked out a sequence play from this situation. It could be worked only when the opposing eleven punted from the goal line or behind the goal line. Such a kick is always made hurriedly because of the danger of a blocked punt at that particular spot. The result is invariably a kick that does not travel more than thirty yards, often not that far. This distance is fairly safe for a try for field goal.

California's play was to make a fair catch of the ball on such a kick and signify intentions to kick. The best punter on the squad would lie on the ground and hold the ball. His ten team-mates would be onside. The play would start. As they approached the man lying on the ground he suddenly jumped up and punted the ball to one side, an onside kick. At that time the famous "Brick" Muller, California's giant end, was playing the extreme position on the left and the kick was to the left. Muller, because of his great height and jumping ability (he was the intercollegiate high jumping champion of America as well) could jump above the reach of his opponents and catch the ball.

While Muller was going after the ball the right end was going to the opposite side line. As soon as the play ended, with the ball in Muller's hands, California jumped into scrimmage formation with Muller back of the line. The ball was snapped to Muller who made a quick, high pass to his right and the right end, unnoticed up to that time because of the surprise element of the play, was unhindered in making the catch and walking across the goal line.

A few years ago, when Ohio State University met California at Pasadena, Ohio State, late in the game, got possession of the ball in front of her own goal line. The Ohio State punter fell back into punt formation, ten yards behind his own goal line. The "only play," of course, was a punt. California's defense spread wide, ready to make the catch and spring the surprise play of the season, but another surprise play killed the California play, for the Ohio kicker, instead of punting, ran with the ball through the scattered defense of the Golden Bear. He did not manage to reach the California goal line but ran almost to midfield before he was brought to earth.

The onside kick has been abolished from football and California will never be able to work her surprise play so it can be set down here as a chapter that was never written into football history.

Like the immortal William Webb Ellis, the Ohio State kicker ran with the ball instead of kicking it. But the same thing had been done before under the same circumstances and the play has carried better results.

How like American football sounds the list of limitations on running with the ball that were agreed upon in England in 1841-42:

(1) That the ball must be caught on the bound.
(2) That the catcher is not offside.
(3) That there can be no "handing on" but the catcher must carry the ball in and "touchdown" himself.

The expressions were old then. In fact, expressions familiar to Rugby football one hundred years ago are similar to those we employ today.

Rugby is not England's most popular game. Soccer ranks first. Rugby has been tried in this country; so has soccer. Rugby failed to get a foothold in the United States but soccer caught on and is becoming more popular each year.

Rugby was adopted as an American college game on the Pacific Coast. One reason for the adoption was that the game did not seem to be as rough as American college football; another reason was that Rugby seemed more fitted to the climatic conditions of the far coast. But Rugby could not be popularized. The trouble was that Rugby too closely resembled American college football. Broadly, the difference between Rugby and our college game is that college football has taken on certain features better adapted to the American sports angle. Soccer differs more widely from football and therefore appeals to a separate taste. This Rugby cannot do. It conflicts with the American style of football.

In connection with the celebration of the one hundredth anniversary of the exploit of William Webb Ellis, the London *Observer* made this comment on Rugby football:

"From a crude and, no doubt, rather brutal pastime in its earliest stages, football has, in the course of generations, so developed that today it furnishes not only a manly and vigorous exercise but a splendid discipline. It calls for strength and pace, quickness of eye, hand and foot, intelligence to seize an opportunity in attack, and pluck and resource in time of pressure. While by some old folk it may still be regarded as nothing more than an outlet for the native savagery of the race, to those of us who have been identified with it for half a century it has become something of a religion. We know what it has done for the youth of the race, and realize that so long as it is played in the proper spirit, its possibilities for good are illimitable."

Any one among American coaches or players or writers upon the subject of football would write something quite similar if requested to set down a few words upon the American game. Nothing could give stronger evidence that Rugby football carries the same appeal and makes the same impressions that the American game does.

When William Webb Ellis violated all customs of the game, and even the rules of his day, by running with the ball, he introduced a feature that made possible our leading college sport. It was the running part of football as played in Great Britain that carried the appeal to America and that made adoption of the chief features of Rugby desirable. The chief thrill of modern football, regardless of the many changes and the numerous innovations, is the run.

Many changes have been made in the rules governing the game in this country. New features have been introduced, such as the forward pass. But always have the rule makers tried to make the game more appealing and, going back over the changes that have been made, it is discovered that the aim has been to open the game more and more and add opportunities for running with the ball. Some of the most spectacular runs in history have been made from forward passes.

Three famous runs, all historic plays, were made possible by the forward pass; for the run is the life of football and William Webb Ellis made it possible to be. If it was not for William Webb Ellis the strong-lunged legions of the cheering sections at our 'varsity football struggles would not arise and chorus:

He ran,
He ran,
Oh, how he ran!

North Caring for Negroes of Great Migration

Gradually, as Experience Grows, Colored Labor Is Given Responsible Work

By LLEWELLYN SMITH

The writer of this article and others to follow is a Negro sociologist who is particularly interested in the larger aspects of America's racial problems. During the war he conducted a series of investigations dealing with the growth of radicalism among the Negroes, which took him to the "black belts" of both the North and the South. At present he is on the staff of a social service organization, national in its scope, which is devoting a great deal of attention to the study of some of the basic contributing factors to the so-called Negro problem.

ACCORDING to Phil H. Brown, Commissioner of Conciliation, United States Department of Labor, 478,700, or nearly half a million, Negro migrants forsook their abodes and occupations and drifted to the teeming industrial centers of the North during the period beginning September 1, 1922 and ending August 31, 1923.

In an analysis of the 478,700 total, Commissioner Brown, who is one of the few colored government officials at Washington, is careful to point out that of Negro migrants for the period noted, Alabama yielded 90,000; Arkansas, 5,000; Florida, 90,000; Georgia, 120,600; Kentucky, 2,500; Louisiana, 15,000; Mississippi, 82,600; North Carolina, 25,000; Oklahoma, 1,000; South Carolina, 25,000; Tennessee, 10 000; Texas, 2,000; and Virginia, 100,000.

For further comparison and inferences, the table below, showing the normal population of each state, and the number and per cent of Negro migration therefrom, is presented:

State	Population	Number of Migrants	Per Cent of T'l M'gr'ts
Total	8,441,106	478,700	100 0
Alabama	900 652	90,000	18 8
Arkansas	472,220	5,000	1 1
Florida	329,487	90,000	18.8
Georgia	1,206,365	120,000	25.2
Kentucky	235,938	2 500	.5
Louisiana	700,257	15,000	3.1
Mississippi	935,184	82,600	17 3
North Carolina	763,407	25 000	5 2
Oklahoma	149,408	1,000	2
North Carolina	763 407	25,000	5.2
Tennessee	451,758	10 000	2 1
Texas	741,694	2,000	.4
Virginia	690,017	10,000	2 1

It will be remembered that during the period of the war the exodus of Negro migratory labor approximated 400,000. While some of the men, with the coming of the winter season, drifted back South, the bulk of them remained. A glance at the mushroom growth of the "black belts" of Chicago, New York, Pittsburgh, Hartford (Connecticut), Detroit, Cleveland, is conclusive proof of this, in spite of the South's "shameless wooing of the departing Abyssinians."

"Not since the children of Israel crossed the Red Sea," said Commissioner Brown, "has the world seen such a cataclysmic sweep of human folk from one part of the country to the other."

Without endeavoring to get at the basic causes of the migration, which are multitudinous, it is reasonably certain that by coming North the Negro did not leave his problem behind him, but brought, literally brought, a stranger, fiercer, more complex one, the solution of which lies in the hands of forward-thinking leaders of both the white and the Negro races.

In the words of Dr. John Hope, President of Morehouse College, of Atlanta, Georgia, the North-bound Negro belongs to a "group of people who have had as a background and habitat for over one hundred years the country rather than the city, and that up until a comparatively few years ago, seventy or eighty per cent of these people lived in the country."

Housing a Grave Problem

INNUMERABLE problems, such as that of housing, of finding a job, of adjusting himself to his new environment, must be reckoned with. Agricultural workers for the most part, one can readily conceive, from a purely industrial standpoint, of the problems that must of necessity arise out of a situation where skill and experience and a modicum of technical knowledge of industry and the life that is synonymous with it are enthroned.

In an interview with the writer, an official at Washington remarked, "It is all very well to help the Negro to come North, but you must not forget that you cannot convert a cotton picker into a steel worker overnight."

Besides the problem of industrial adjustment, there is the larger, more vital one, of the relations between the races. Your Second avenue radicals are continuously harping on the solidarity of black and white workingmen. It is said that the Socialists have gone so far as to subsidize a Negro magazine in New York which is doing its utmost to bring white and black workingmen together. Fortunately, or unfortunately, the magazine in question, from its lofty messianic pedestal, is not and cannot possibly be read by the Negro working class. It is too glamorously intellectual, too obviously and characteristically a re-hash, without regard to the Negro's condition or particular needs, of the Marxian theories of the scarlet journals.

In other words, while it is conceivable for a Negro poet or scholar, out of the moaning void, to rise up, and sound a discordant note in defense of the spiritual liberties of the black man, the bulk of the Negro people, for a long time to come, must resign themselves to the soil, to the accumulation of wealth and property and the development of a living standard approximating that of the white man. This is an elemental fact that most Negro leaders are not willing to face.

With the oncoming of the blacks to the cities of the North the need for work of this nature is becoming more and more acute. There is one organization, however, that is bravely blazing the trail along this line. That organization is the National Urban League for Social Service Among Negroes.

The Urban League was founded twelve years ago by Mrs. William H. Baldwin, a white woman. Its aim was to help adjust the Negro migrant from the South to the conditions confronting him in the North. With a budget of $2,500 to start out with, its first executive secretary was Mr. Eugene Kinckle Jones, a colored graduate of Virginia Union University, and a former teacher in the high schools of New York City.

At first the Urban League concerned itself chiefly with finding the new migrants jobs. It brought to the attention of Northern employers the vast reservoir of Negro labor that was then coming North. (Negro labor was migrating at the rate of 20,000 a year.) All it asked was "not alms, but opportunity." It opened hitherto closed doors to skilled and unskilled Negro labor. Gradually its scope widened. It discovered that after it had found the migrant a job it was expected to do something about finding him a suitable place to live and to furnish advice and counsel with regard to such basic things as health, child welfare, thrift, recreation, racial co-operation, and so on.

EUGENE KINCKLE JONES,

Executive Secretary, National Urban League.

Work of the Urban League

SOON the work of the Urban League grew to gigantic national proportions. Now it has offices in charge of League-trained workers in forty cities in the United States. Its annual budget is now $250 000. And Eugene Kinckle Jones, who is "not unknown to fame or oratory," is still on the job. Through its field workers, Negroes trained at Harvard and Yale, it gathers and disseminates the *facts* of the Negro problem, and all phases of it.

It publishes a monthly magazine, *Opportunity*, which is edited by Mr. Charles S. Johnson, Director of Investigations and Research, a graduate of the University of Chicago, and one of the six Negroes appointed by Governor Lowden on the famous Chicago Race Commission.

L. Hollingsworth Wood, a prominent Quaker lawyer of New York, is president of the League. William H. Baldwin, son of the founder, and fiscal agent for Fisk University, is secretary. On its Board of Directors are Major Robert R. Moton, of Tuskegee; Dean Kelly Miller, of Howard University; John T. Emlen, Roger N. Baldwin, A. S. Frissell, George C. Hall, Miss Nannie Burroughs, Mary McLeod Methune, Mrs. Booker T. Washington, Theodore Roosevelt, Miss Elizabeth Walton, John W. Davis, and Dr. James H. Dillard.

From October 16 to October 19 of this year the Urban League held its annual convention at Kansas City, Missouri. Delegates from Florida, California, Louisiana, Massachusetts, in fact, from every part of the country, were in attendance. In addition to League workers, there were representatives of large employers of Negro labor, each of whom presented the attitude of the employers with regard to the induction of Negro labor into Northern industries.

It might be well here to state that the concerns represented, all large employers of Negro labor, felt that the experiment was a successful one and that the Negro workers were just as competent and as desirable as any other. It was felt, however, that too much cannot be done in the way of safeguarding the Negro from the possibilities of a business depression, the action of a manufacturing concern in Middleton, Ohio, which has provided for the utilization of surplus Negro labor by constructing camps and encouraging farming and truck gardening, and so on, being used to illustrate the sort of thing the larger employers should be prepared to do.

In the steel district of Pittsburgh, according to John T. Clark, executive secretary of the Pittsburgh Urban League, estimates of several steel officials indicate that from ninety per cent to ninety-five per cent of steel mill work is unskilled, therefore, it is reasonable to suppose that practically all of the 16,000 Negroes representing twenty-one per cent of the working force in 23 mills of that district are almost entirely engaged in common labor. This supposition will be strengthened when it is considered that prior to 1916 there were no Negroes employed at all in 19 of these 23 mills.

In spite of the official classification of so large a part of the work done by Negroes as unskilled, the observer is inclined to consider any workman skilled who quickly learns to synchronize his movements with machine operations, so as not to slow up their normal production. Whether steel officials agree with this intrepretation or not, they testify that Negroes adapt themselves readily to the work. Frequent reports of production records being broken with smaller crews of Negroes than crews of foreigners doing the same work, might be attributed largely to the eagerness of Negroes to make good and to earn more money with which to re-establish their families in the North.

Conditions Then and Now

DURING the first years of the war, when a Negro obtained a job in most mills, he had to make friends with the groups of white workmen to stay, but under present demands for labor, Negroes are gradually being advanced according as they show qualities of dependability, efficiency and leadership. Foreign leaders of Negro gangs are gradually being displaced by Negro straw bosses. This policy seems to have been adopted by several corporations, even where Negroes form less than one-third of the gangs. In one plant employing 2,875 Negroes, there are thirty-five Negro straw bosses, directing the work of 883 men, 273 of the laborers being foreigners. In most of the larger steel mills usually an equal number of Negro straw bosses may be found. This is very significant. The greatest difficulty previously experienced by Negroes entering the mills was the lack of sympathy and understanding and ofttimes hostility shown them by these foreign straw bosses. One result of the increased use of Negro straw bosses is the reported length of time three-fourths of the Negro employes remain in mills. It has been increased from an average of one month during the war to three and a half months at the present time.

Efficiency engineers say that Negroes have constitutions which render them peculiarly efficient at work in high temperatures. Negro foremen have been found performing other work, some including the direction of skilled white workmen.

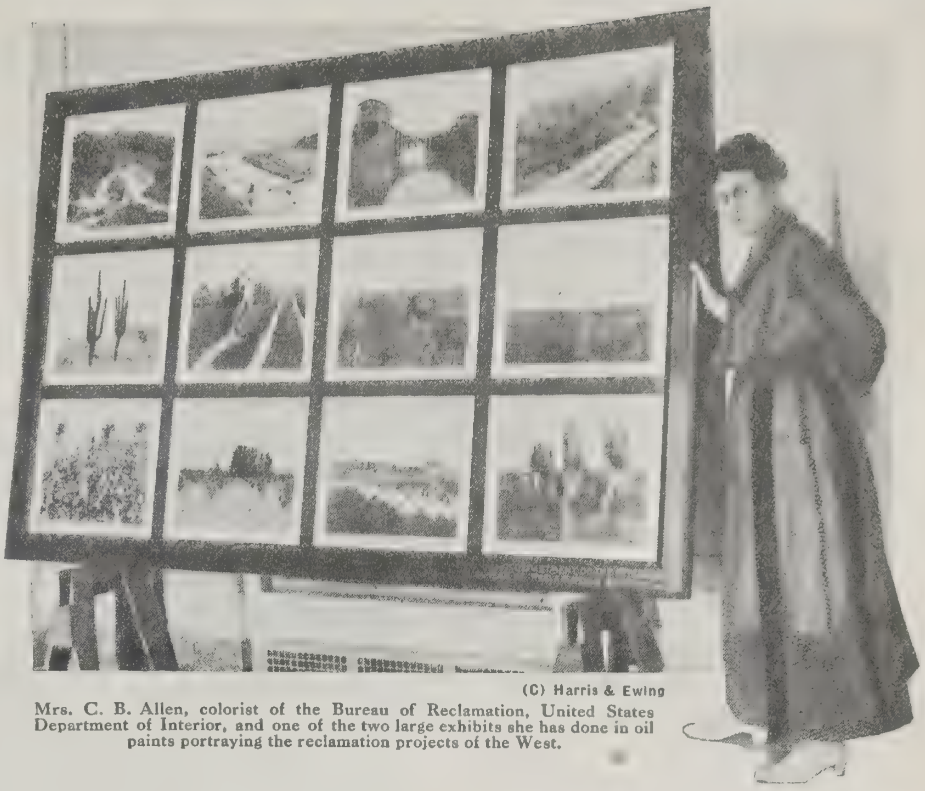
The experience of Negro labor in two small steel mills, Park Works of the Crucible Steel Company and Clark Mills of Carnegie Steel Company, can be cited to give a better indication of how well Negroes may ultimately intrench themselves in larger plants into which they are just being absorbed. Both of these plants introduced Negro labor more than thirty years ago on the occasion of a strike. They have used an increasing number ever since. The Park Works employs about twenty-five per cent Negroes and the Clark Mills forty-two per cent. Negroes are employed as grinders, heaters, shearers, chippers, rollers, squeezers, ruffers, crane operators; in fact, work on practically every job in the mill. Both plants employ Negro millwrights who repair all the machinery. In addition, the Park Works has a Negro chemist in charge of three white subordinate chemists. They also employ a Negro draftsman. At one time, before the recent depression, a Negro civil engineer was employed. At the Clark Mills, according to their own statement, no limitations were placed on Negro workmen. They cite the case of "Daddy Clay" who developed into one of the greatest experts on shaft steel in Pittsburgh. For years he earned from fifteen dollars to forty dollars a day.

As for the mills recently entered by Negroes, there are unusually illuminating evidences of the progress they have made in the more skilled work. Bonuses on every ton run the workmen's pay often to twenty dollars a day. Reports of extraordinary wages have brought thousands into the steel industry. Disillusioned, they work but a few days, then join the army of steel work floaters, try out mills everywhere, hoping by accident they may stumble into a job paying big money.

Woman Tells Story of Irrigation in Colors

Oil Paintings by Mrs. C. B. Allen, of the Department of the Interior, Show Scope of Reclamation Work

By S. R. WINTERS



(C) Harris & Ewing

Mrs. C. B. Allen, colorist of the Bureau of Reclamation, United States Department of Interior, and one of the two large exhibits she has done in oil paints portraying the reclamation projects of the West.

IF ALL the water-carrying channels in the twenty-eight reclamation projects of seventeen western states formed a single canal it would extend 14,000 miles. The excavation of 209,000,000 cubic yards of soil, rocks, and other material, was involved in the digging of the canals, ditches, and drains whereby water is supplied for the irrigation of 33,000 farms, which sustain 450,000 persons.

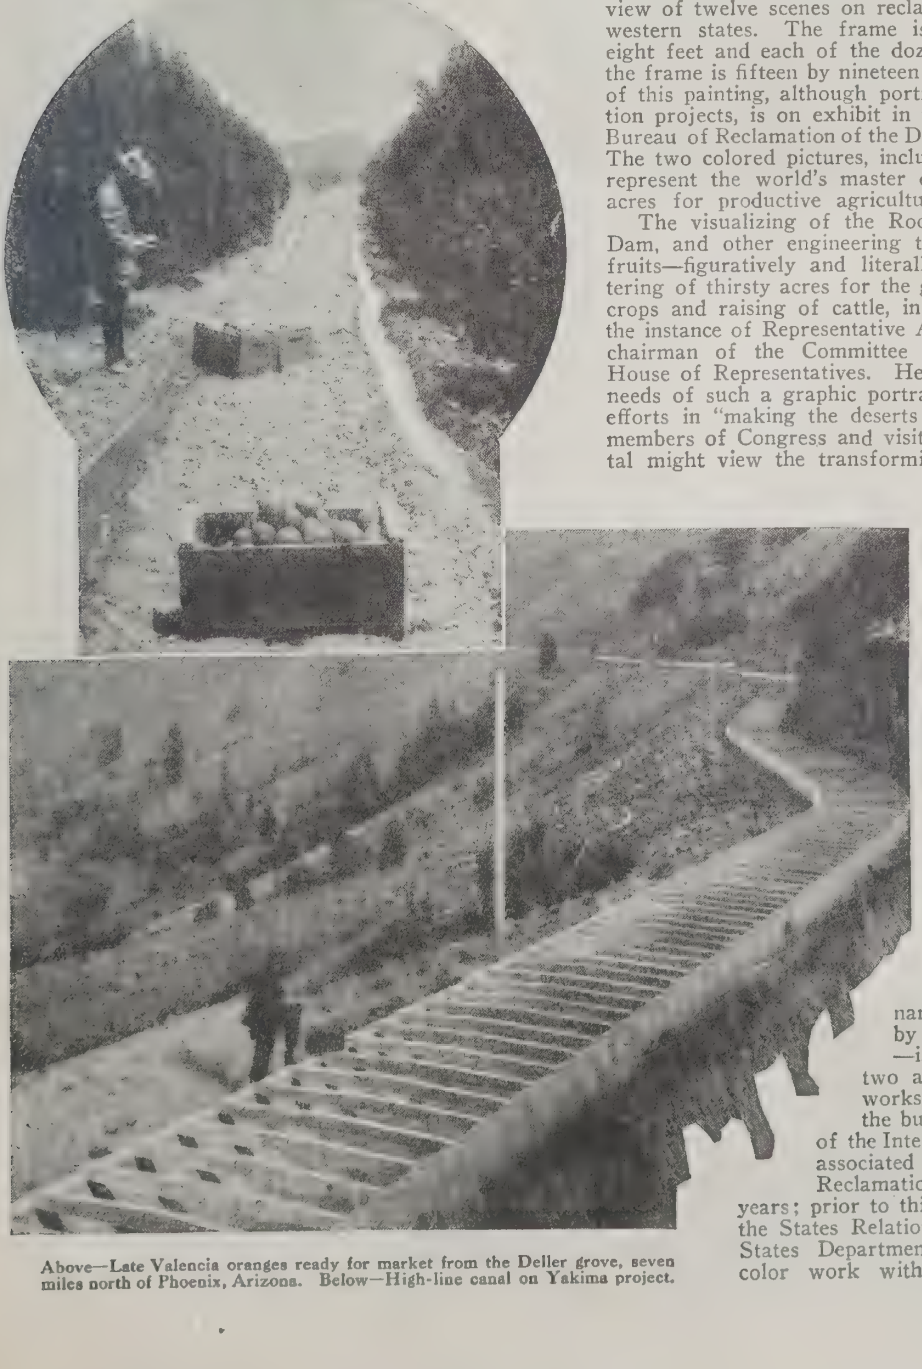
The reclaiming of more than 3,000,000 acres of arid lands also involved the construction of one hundred and one tunnels, in excess of 1,000 miles of highways, eighty-three miles of railway, 3,294 miles of telephone line, a dozen power plants, and 970 miles of electric-transmission lines. Coal was mined and cement was also manufactured, the production of cement amounting to 1,676,000 barrels.

The storage and diversion dams for the containing and distributing of an artificial water supply, built by the Bureau of Reclamation of the United States Department of the Interior during the last two decades, exceed one hundred in number, with an aggregate volume of 15,000,000 cubic yards of water. These pent-up supplies of water include the Arrowrock Dam, on the Boise River, Idaho. This structure, in towering 349 feet above bedrock, is the highest dam in the world. The Elephant Butte Dam, on the Rio Grande, New Mexico, is 306 feet high.

The magnitude of the structural units comprising the reclamation projects of the West is, however, only a means unto an end, namely, the conversion of unproductive acres into crop-producing lands. Of the 3,384,000 acres comprising these irrigation enterprises, water was furnished to 1,227,900 acres, in 1922. And of this crop-producing area, 1,109,100 acres yielded crops valued in excess of $50,000,000. The additional lands applying stored water harvested crops worth $33,000,000. Thus, with the Bureau of Reclamation functioning at a yearly expenditure of approximately $10,000,000, the returns to the settlers are in the neighborhood of $83,000,000.

The total cost of the construction of the irrigation projects was $143,000,000, according to an estimate made at the end of the fiscal year terminating June 30, 1923. Funds for the construction and operation of these reclamation works are largely derived from the sale of public lands, from repayment by the users of water, and recently from oil-leasing and other mineral operations. These sources of revenue are augmented by payments of settlers, whose obligations are customarily made in twenty annual installments without interest. At present, soldiers of the World War have priority of entry to farm units recently made available.

If the water hemmed in the reservoirs maintained in these seventeen arid and semi-arid states were released, it would flood an area equal to the dimensions of the state of Connecticut to a depth of three feet. The beneficent results to mankind in the creation of artificial water supplies where there is a scarcity of rainfall from the clouds are evident in the transformation of sagebrush and desert into fertile areas, on which have been produced approximately $400,000,000 worth of crops in twenty years. That is to say, 450,000 persons are sharing in the newly created wealth found on 33,000 irrigated farms.



Above—Late Valencia oranges ready for market from the Deller grove, seven miles north of Phoenix, Arizona. Below—High-line canal on Yakima project.

Temporarily on exhibition in the lobby of the House of Representatives, but later to be permanently installed in the cloakroom of this wing of the national lawmaking body, is an oil painting presenting a panoramic view of twelve scenes on reclamation projects of these western states. The frame is approximately five by eight feet and each of the dozen miniature pictures in the frame is fifteen by nineteen inches. The counterpart of this painting, although portraying different reclamation projects, is on exhibit in the building housing the Bureau of Reclamation of the Department of the Interior. The two colored pictures, including twenty-four scenes, represent the world's master effort in reclaiming arid acres for productive agricultural purposes.

The visualizing of the Roosevelt Dam, Arrowrock Dam, and other engineering triumphs, as well as the fruits—figuratively and literally—of the artificial watering of thirsty acres for the growing of orchards and crops and raising of cattle, in oil paints, was done at the instance of Representative Addison Smith, of Idaho, chairman of the Committee on Reclamation of the House of Representatives. He realized the educational needs of such a graphic portrayal of the government's efforts in "making the deserts blossom," that both the members of Congress and visitors to the national capital might view the transforming powers of irrigation within the period of twenty-one years. His request was transmitted to the Bureau of Reclamation for execution, with the result that after three months, the most pretentious exhibit of its kind is in completed form. In a word, the artist has told the story of the development of 3,384,000 acres of arid lands, converted into 33,000 farms for the occupancy of 450,000 persons, in oil paintings. The scenes are faithful to detail and pleasing to the eye.

A woman artist—Mrs. C. B. Allen, by name, officially designated by Uncle Sam as a colorist—is responsible for these two artistic productions. Her workshop is room No. 6040 in the building of the Department of the Interior. Mrs. Allen has been associated with the Bureau of Reclamation for the past three years; prior to this she was identified with the States Relations Service of the United States Department of Agriculture. Her color work with the latter government bureau did not widely differ from present assignments, save that scenic coloring of reclamation projects partakes of the vastness of landscape and the bigness of engineering endeavor.

Mrs. Allen was born in Springfield, Ohio, but early in girlhood moved to Topeka, Kansas, where she attended public and private schools. Her art education was received under private tutelage in Washington, D. C., and in the course of instruction at the Corcoran Art Gallery. She has copied many of the best pictures hanging in this national receptacle for the products of brush and paint.

The execution of the paintings depicting the accomplishments of the Bureau of Reclamation was done in a room containing modest furnishings and with only the absolutely necessary equipment for coloring—oil paints, brush and easel. Mrs. Allen labored amid interruptions for three months, painting with patience and fidelity the towering Arrowrock Dam, 349 feet high, and the cotton blossom which potentially clothes the settlers in the Rio Grande project of New Mexico and Texas. The photographic files of the Bureau of Reclamation, over which she also presides, are drawn upon for likenesses of the various scenes that were to be portrayed in colors.

A homesteader of one of the far western states came into the workshop of Mrs. Allen one day recently while this writer chanced to be present. His flowing beard and sun-kissed brow might have identified him as one of the pioneers of the West. He spoke with a frankness and honesty of opinion that lent weight to his views. This tiller of the soil, one of the 450,000 persons to be the recipient of the fruits of irrigation, obviously came to see and criticize the artistic productions of Mrs. Allen. He marveled in pleasurable anticipation at the realistic touches of the apples, the detail and magnitude of the water reservoirs, and spoke of the faithful likeness of the scenic surroundings. His criticism was adverse in only one instance, when he expressed the opinion that a field of alfalfa was a bit off color. This observation indicated the critical eye with which he viewed each scene, in other instances only to marvel at the fidelity of likeness and the splendor of the scenes.

From the cotton patch in Texas and New Mexico to the grain field in Oregon and the apple orchard in Washington, these brilliant scenic views embrace the range of activities of the settlers on these reclamation projects. The inviting colors of the paintings are pleasingly introduced by alluring text, prepared by Dr. Hugh A. Brown, of the Washington office of the Bureau of Reclamation. A herd of Jersey cows maintained on the Newlands Project in Nevada is labeled "Aristocrats that are helping to put the projects prominently on the map," whereas, a flock of chickens on the Belle Fourche Project in South Dakota is identified as "pin-money," the proceeds from poultry and eggs netting $100,000 each year to the settlers on the twenty-eight irrigation enterprises.

Alluring enough are the descriptive legends, "Great seas are created whose waters make the desert blossom," "Huge storage dams block abysmal chasms," "Vast level-floored valleys have been transformed from regions of desolation into compact farming units," and "Scattered through the arid states oases of gold and green fulfill the prophecy of Isaiah." Views of a peach orchard, alfalfa field, orange grove in Arizona, diversion dams, a barren desert in New Mexico, a canal; an apple orchard in Washington, a flock of sheep in Montana, are among the panoramic presentation of Uncle Sam's vast reclamation system. Beautifully done in oil paints, and appropriately explained by text, these artistic productions, placed in the lobby of the House of Representatives, should enable Congressmen and visitors to the capital alike to comprehend and appreciate the reclaiming powers of the stroke of the engineer, an artificial water supply, and the resultant transformation of sagebrush and desert into productive areas.

St. Louis' "Forty Thieves" Are Gangsters

Mississippi Port Is Wrestling With a Reign of Lawlessness Which Has Evaded Police Control

By GEORGE H. DACY

THE tale of Ali Baba and the forty thieves has almost as many rivals as there are weeks in the year in the environs of St. Louis, once a center of French chivalry but now a city that suffers from a cancerous outgrowth of gangster misdeeds.

Three gangs of youthful criminals—highly organized, fortified with the support of prominent political henchmen and ruled by the "might is right" theory—have for many months been playing pushball with law and order in Missouri's leading municipality. In many respects, their misdeeds make the heinous offenses of the notorious Jesse James look like the juvenile delinquencies of third-rate amateurs.

As this story is being written, I have before me two of St. Louis' evening newspapers. The leading story in one daily tells about a $1,000,000 mail fraud ring operated under the auspices of the Cuckoo Gangsters. The other journal carries a front-page story about "Jelly Roll" Hogan, ringleader of the Hogan Gang who was apprehended on a prominent avenue at midday because he was "heeled," in the popular style of the early western frontier, with one concealed revolver in his hip pocket and four other weapons in the pockets of his automobile.

Killing Each Other Off

A FEW days ago "Whitey" Doering, an ace of another band of rascals called "Egan's Rats," was sentenced to life imprisonment for a notable mail truck robbery and shooting affray which resulted in a loss of a quarter million dollars to Uncle Sam. Doering, who owns a $25,000 home in the fashionable West End section of St. Louis, is now out on an appeal bond of $90,000. "Bill" Wiseman, another Eganite and confederate of Doering, received a twenty-year sentence the same day.

One night, several months ago, a quartet of Cuckoos, whose ages ranged from eighteen to twenty-five years, held up three fashionable road houses and escaped with a valuable lot of booty. They remained in the neighborhood of the last road house. An hour or so later, a St. Louis policeman, off duty, stopped at the place during an automobile ride with his sweetheart. The pair seated themselves and ordered soft drinks. A gangster walked over to the policeman's table, quickly drew a gun and shot the officer without any provocation whatever. The gangsters then abandoned their automobile but at pistol point commandeered the powerful car of a passer-by, forcing him to drive them at great speed to the city. On the outskirts of St. Louis, they ordered the owner of the car to jump out. When his back was turned, a gangster shot him dead. The boy bandits then raced into St. Louis, where they wounded another innocent citizen before they were finally captured by the police.

A feud as bitter as any ever waged in the highlands of Kentucky or Tennessee is now threatening the ultimate extinction of the Egan and Hogan bands of gangsters. This deadly enmity between the two clans has been more effective than the officers of the law in consummating the curtailment of crime. Kerry Patch, now the nucleus of the St. Louisian Little Italy, is the native heath of both the Hogan gangsters and "Egan's Rats." The Patch covers an area of approximately fifty square blocks and has been the breeding grounds of some of the most dastardly crimes committed during the history of St. Louis. About a dozen years ago, "Egan's Rats" and the Hogan Gang came into being. "Tom" Egan, a saloon-keeper and powerful politician in St. Louis in those days, was the citizen chief and political power of the gangsters who naturally became members of his following in the district where he operated his bar.

Brother Takes Leadership

WHEN "Tom" Egan died, the leadership of his gang passed as a logical legacy to his brother, "Will," who ran another saloon. The gang prospered as previously. Egan engineered political strategems which kept the gangsters out of jail. It was almost impossible to tie a crime and to assemble adequate circumstantial or armor-sure evidence to convict the culprits—if they were caught. No matter how high was their bail when captured, Egan always produced the cold cash. The criminals never would talk on the witness stand. Clever lawyers always represented them. Other witnesses, in fear of death, would refuse to testify against the "Rats." Gang loyalty such as is rarely met with among catch-as-catch-can criminals has always been the first commandment of the Eganites. They have endured because of this fealty of the members and because they have terrorized the sections of the city where they have operated.

For several years, ill feeling existed between the members of the Hogan and Egan gangs. This bitterness finally culminated in the murder of "Bill" Egan, a memorable crime which instituted the death feud between the two groups of criminals. One evening Egan was standing in front of his place of business. A large touring car, closely curtained, came racing down the avenue at fifty miles an hour. As the car tore by the curb where Egan stood, a fusillade of shots rang out. Egan dropped to the pavement, dead.

"Egan's Rats" ferreted out the secrets of the case and finally traced the crime to leaders of the Hogan tribe. Then began an era of midnight killings such as St. Louis had never previously experienced. The common saying among the police and plain clothes men was the effect that "when gangsters ride, somebody is due to die," for most of the murders were perpetrated in the same manner as that which attended the death of "Bill" Egan. One Hogan man was decoyed into an automobile at night and lured to a lonely road by a young woman—an adherent of the Egans. Another car sped by at a breakneck speed, a torrent of shots belched forth and the Hogan gangster milled over in a heap, another victim of the deadly feud.

One of the "Rats" after a criminal excursion which kept him awake for two days and nights stopped at a gangster road house, rented a room and told the proprietor he intended to sleep for thirty-six hours. He never awakened from his deep slumbers, as one of the Hogan supporters shoved a sawed-off shotgun through the window and killed his hated rival as he slept.

All this time, the St. Louis police were doing their best to exterminate the gangsters. They followed orders from headquarters to "shoot to kill" in all encounters. As often as not, however, the gangsters shot first or else submitted quietly and calmly to arrest. If concealed weapons were found in their automobiles, the boy bandits would immediately flash the stars of constables, deputy constables or other badges of authority which permitted them to carry firearms. These credentials were always simon-pure. One criminal finesse of the "Egan Rats" was to devote political strength to the securing of such minor offices for members of the desperado clan.

The police forces, however, in the long run, made the city of St. Louis too hot for the gangsters. Then the miscreants boldly moved their headquarters and notorious rendezvous out into the highways and byways of St. Louis County. The abandoned buildings of a deserted race course have now for many moons been the homing haunts of the members of one of the gangs. Their enemies meet in several disreputable road houses. The dangerous task of trying to run the gangsters to cover has been shifted to the county sheriff and his deputies. These officials are performing efficient work and their lives of constant action are as perilous as those of the Canadian mounted constabulary.

The Courage of This Deputy

ONE of the deputies, George Roth by name, is deadly accurate with a pistol, and courageous. One evening, he stopped to rest for a while in a road house. Shortly afterward, four men entered the room, ordered something to drink and, unexpectedly, as they were being served, pulled out revolvers and commanded every other occupant of the resort to throw up his hands. One gangster thrust his gun into Roth's face. The deputy made a feint as though to raise his arms over his head. With one fist, he knocked the revolver from the criminal's hand and with the other tumbled the ruffian to the floor. Roth drew a revolver, seriously wounded two of the holdup men and chased and finally captured the other pair that fled.

Such exploits, admittedly, put failure into gangster activities and gradually reduced their ranks. The mortal combats are not always decided in favor of the authorities. Not infrequently, it is the officer of the law who is wounded or killed. There has been a sort of local slogan which has developed in the neighborhood of St. Louis, "Just leave the gangsters alone and in time, in their feud warfare, they will solve the problem by killing each other."

In the expression of such an opinion, the general public is evading a duty. San Francisco, years ago, faced a terrible crime wave which was more extensive and critical than the one which has latterly confronted St. Louis. The Vigilantes solved the riddle and dissipated misdoings in the environs of the Golden Gate. A similar private organization in St. Louis County may be a development of the future if the gangster crimes continue. Such a citizen procedure is probably the most efficient cure-all of the gangster régime. The calling out of state troops to suppress the outrages would establish a notable precedent in the disposition of such crimes. The mobilization of a sheriff army which would comb the countryside, round up all the gangsters and then see to it that impartial justice is served to them will solve the crime crisis in St. Louis or any other American county which is suffering from a similar affliction.

During the last two years, as many bank messenger and pay-roll robberies have occurred in St. Louis as in any other city of similar size in the world. Such pursuits have been favorite pastimes of the organized gangsters—specialized freebooters who spurn ordinary crimes when the plunder from the lines they follow offers more attractive booty. The St. Louis police and detective departments are highly efficient but they have been unable to crack the gangster conundrum with the facility that they have worked out other criminal enigmas. Illustrative of the good service rendered by the police, the St. Louis record of a recovery of more than ninety-six per cent of all the automobiles stolen in that city during the last twelve months is outstanding—one of the most creditable showings of any city police force in the country. The St. Louis gangster problem has been different from that of any other city in the United States. It has not reacted successfully to treatments that have expurgated band criminals in other cities.

Since prohibition, many foreigners who live in St. Louis have abandoned their ordinary avenues of livelihood and engaged in the surreptitious business of making liquors and wines which they peddle at great profits. Immediately, the gangsters specialized in a new and novel lawlessness now known as hi-jacking. They kept close tab on the bootleggers and whenever the liquor salesmen made large collections, the gangsters would be on hand to relieve them of their illicitly acquired gains. In time, for purposes of self-protection, the wine-makers allied themselves with the different St. Louis bands of lawbreakers. This material has restocked the depleted ranks of the gangsters and provided new and numerous supporters who, in the main, take kindly to professional crime and feud justice.

"Egan's Rats" for a time also specialized in the original diversion of holding up "crap games" where the stakes were high. The "Rats" never had any trouble finding out the localities where dice games were popular. They easily familiarized themselves with all the inside workings of these games. When the stakes were the maximum and the attendance largest, several of the "Rats," armed and masked, would "drop in" and clean out with the profits.

The Present "Master Mind"

THE Missouri gangs also evidently issue guest cards and visitors' privileges to itinerant criminals who come that way. In one raid of an "Egan Rat" stronghold, the St. Louis police captured five safe blowers from the Far West who were positively identified as non-members of the local gangster squads. On another occasion, one of the notorious McNamara brothers of San Francisco was rounded up in St. Louis as a guest of the hordes of Hogans who terrorized the district where the Pacific Coast "bad man" was found.

The present leader of "Egan's Rats" is a former lieutenant of William Egan. Meet this man in an office, club or restaurant anywhere in St. Louis and you will be delighted with his gentlemanly manners, conversational poise, wit and humor. As the directing genius of the gangsters, he has repeatedly measured wits with the police, private detectives and able lawyers—and won. He is a master mind of the underworld which commonly is met with only in fiction. Under his leadership, the "Rats," unquestionably, are engaging in more daring crimes which involve princely rewards of plunder.

Latterly one of the sheriff deputies of St. Louis County who has spoiled some of the best-laid plans of the gangsters received a number of anonymous letters warning him not to travel after dark a certain road which led to a farm that he owned some distance from the city. The deputy finally visited a road house meeting-place of the gangsters one evening when he knew the leader would be on hand. He told the gang chieftain all about the case and suggested one of the "Rats" whom he suspected as author of the letters. The master mind said, "If........did this, I'll shoot him right before your eyes."

A Clean-up Is Certain

THE leader then called the gangster in question before him and ordered the young fellow to write a message which he dictated. The gang chief then compared the writing. There was no similarity between it and that of the anonymous letters which the deputy had received. Nothing more came of the matter. The deputy traveled the highways and byways without misfortune. The incident merely illustrates the boldness of the gangster chieftain. He threatened to shoot one of his underlings in cold blood right before an officer of the law and doubtless would have done so if the writing test convinced him of the guilt of his follower. More than likely, even if the chief had killed the gangster, he would not have been punished for his crime immediately, as, in his usual able manner, he probably would have circumvented justice in one way or another.

The St. Louis gangsters have largely been throwbacks from the general principle that the ultimate goal of the most of criminals is either death by violent means or life sentence in the penitentiary. The time is not far distant when both St. Louis City and County must be cleared of these young desperadoes. How it will be accomplished would be only conjecture if mentioned in this article. It will be as certain as the millennium when it does occur. Like the murmur of far-distant breakers sweeping in from the sea, the popular campaign is already simmering and seething in the neighborhood of St. Louis which will shortly mature into a thorough clean-up of Chicago's cousin municipality.

Bavarian Carvers, With Lang, Come to U. S.

Passion Play Participants of Oberammergau Seek to Sell Products Here

By ROBERT S. ALLEN

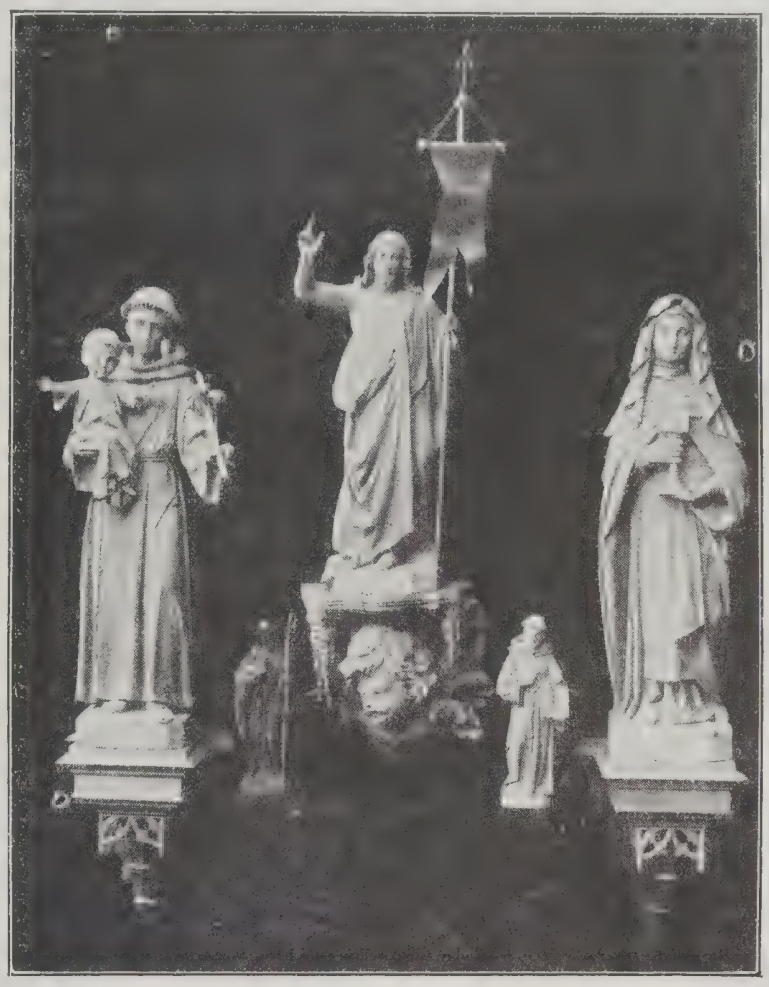
FROM the foot of the Bavarian Alps on the little stream Ammer, from which Oberammergau, Germany, the village of Passion Play fame, derives its name, there left for America on November 29 a group of twelve wood and pottery artists headed by Anton Lang, the Christus of the Passion Play. The visit includes New York, several other eastern cities as yet not determined upon, also Chicago and possibly Milwaukee. With them they bring wares of pottery and wood carvings which they have made with their own hands. They come to make a market for their artistry. Germany in the throes of misfortune can no longer support these gentle artisans. Germany today cannot buy workmanship in wood and pottery, even though it is of an artistry unrivaled in the world. Germany is fighting for its bread and meal. And so these men, the sons of sons who were sons of sons of potters and wood carvers who lived and worked in this little hamlet, are bringing their wares and the wares of their friends and neighbors to America to show their craftsmanship and sell their work that they may not starve.

This is the first time in the 300 years of Oberammergau's existence that its artisans have left their native soil. This is the first time that the beloved and revered Christus has left Bavaria, the southern state of Germany in which the village lies.

Oberammergau pottery and wood carvings are not unknown in America or Canada. Before the war there was considerable work ordered from these countries. But since the war the trade has practically disappeared and, with conditions at home as they are, these craftsmen are in a desperate plight.

Without a market for their wares the life of the community is at stake. Oberammergau is but a small village of four hundred or five hundred families, whose sole industry and life work is the Passion Play given every ten years and their wood carving and pottery. Without a market for the latter the community must disintegrate and scatter. And so it is to preserve its community and its history and work that this group is coming to sell its beautiful images and to create a market for future sales.

Anton Lang, the Christus, is a potter, now the only one left in the village. The community is famed next to its play for its beautiful wood carvings of holy figures. Lang's pottery deals mostly with the same subject, though he accepts orders for any style of work. He has a small shop in the rear of his home where he works with several assistants and apprentices. The Lang family is an important and large one in Oberammergau. There are at least a dozen Lang families in the village, all leaders in the community. The family has numbered among its progenitors many Burgermeisters, which translated means mayor but in Germany means more than the term implies in America. A Burgermeister is the father and the leader of his people, their judge and their guardian, in the most literal sense. The Lang family has also wood carvers, but the Anton Lang branch have been potters for more than 200 years.



These are reproductions of holy figures, life-sized and smaller, made by the wood carvers of Oberammergau who have come to America to place their craftsmanship on sale. These reproductions were taken from the model book of one of the best carvers in the community, Sebastian Schauer. The models are of figures made by his grandfather and father and now by himself and his son. The craft is centuries old and has grown up with the Passion Play.

Oberammergau is at least 400 years old. Nestled right at the foot of the Bavarian mountains, at the head of an ever-widening plain that issues from these Alps, in medieval times it was a first stop into Germany from the south and the last before the strenuous journey to the south. It was never a fortified city. Just a rambling sort of a farm community at first, with a few wood carvers who traded with travelers who came across the mountains.

In 1630 the black plague ravaged the community. The small city was decimated. A solemn vow was made that if the village was spared from total extermination that every ten years would be given a pageant portraying the career of Jesus. The scourge abated and the survivors have fulfilled the vow, on every tenth year since. Because of the war there was no play in 1920 and for the first time in the history of the play it was given on an odd year when it was shown in 1922. This briefly is the well-known story of the Passion Play.

And with the play grew up this art of holy carvings and pottery. The entire community takes part in the play and the many principals are trained from youth not only to act their part, but live in their daily life the gentleness and simplicity of the founders of Christianity. And so it was natural that in their work they should reflect their lives, and the carving of holy images of all kinds grew up with the fame of their play. Before the war they had a world trade, the beautiful workmanship of figures from inches to many feet in size adorning places of worship in Australia, America, North and South, Africa and in missionary countries.

The woods worked with are linden, pear and maple, all grown in the neighborhood. The linden and maple are white woods, and are used for figures that are to be painted. The pear is a darker wood, given to beautiful stainings. Every bit of carving is done by knife or chisel. Not a wheel or lathe can be found in the village. Even sandpaper is seldom used, and only when the decorations call for gilding.

The work is mostly of holy figures, which have been developed to hundreds of varieties and sizes and extraordinary beauty by the centuries of development and production in the same place and by the same families of artists. Other figures, however, are made when ordered.

The group coming to America brings its own work and that of the other craftsmen who were unable to make the trip. The group consists of The Christus, Peter, who is one of the best wood carvers in the village, and Judas, with nine others who are wood carvers and players in the Passion Play. They are arriving in time to place their wares on sale for the Christmas buying.

"No Honest Yeggs Any More"

Concluded from page 5

less distinctive in the average person than the mouth. The mouth is the great give-away feature; it tells what you are, the kind of life you have led."

Something has been said about "cover men." The everyday citizen probably has little idea how necessary they are to the work of preventing crime and leading to arrest of criminals. They are peculiar halfway folk who are in the confidence of the underworld and yet give information to the law enforcers. Some are former criminals who have "cut it out." Some, not criminals themselves, like the adventure, and the danger, in mixing with criminals, justifying their choice of associates by serving the law. Nor are the "cover men" confined to these two classes.

"Without plenty of 'cover men' at work or available, I could hardly do business," Brown admits. "Of course, we say little about them and protect their identity absolutely. We are constantly finding new sources of recruits for this work, and just now prohibition is helping us largely.

"Yes, that may seem odd, but it's this way. You see there's a bond of sympathy among criminals. It is a peculiarity of the crook class that they admit all kinds of lawbreakers to their circles on a basis of absolute equality and confidence. Prohibition has created an army of bootleggers, and the bootlegger, being an outlaw, is received as a brother by the bank 'yegg' and crooks in general. They talk freely before him, assuming that he is one of them. But it happens that your bootlegger often is far from being an all-round criminal; on other phases of law observance his views are likely to be quite correct. So we get many 'cover men' from the bootleggers. 'It's an ill wind—.' "

Law violators and near violators may thus be important aids in crime prevention and law enforcement, but perfectly sound, law-abiding folks, not paid for it, often help, as part of their everyday jobs, in running the criminal down or checking his depredations. Among all such, Charles D. Brown would pay special tribute to telephone exchange operators, particularly those—many of them women—working the night boards in country towns.

The "Hello" girl is one of the yeggman's main fears. When he and his gang enter a town, about the first thing they do is to cut the trunk lines leading from the exchange, both local and long distance, for the telephone is the chief instrument in starting the hue and cry against "yeggs"—a hue and cry far more sinister and effective, though less spectacular and dramatic, than that of other days. Not by shouting and clamor, not by throwing of stones and clubs, not by barking of dogs and the running of many feet, is the modern hue and cry conducted; but silently, swiftly, more terrifying in its menace and scope, the word goes out to all men of a thief at large, where he was seen and when, whither he was fleeing. And then other telephones take up the cry, and not for mere blocks in a city section, but for miles over county and state the word is sped—and telegraph and radio stations repeat it—rousing officers and posses at many points, until he is both clever and fortunate indeed that can escape.

" 'Yeggs' torched a bank in Nassau, Minnesota, near the South Dakota line, some years ago," Brown recalls. "It was early winter and a light fall of snow was still on the ground when I arrived. The 'yeggs' had left nothing but footprints. They had entered and gone out the back way, and their footprints were plain. Yes, the local men thought the job looked like a deep one. But when I saw the footprints, I had to laugh. They spelled 'Dynamite Bill' as if in letters; for Bill was one of the most pigeon-toed of men, and there in the snow, unmistakably, ludicrously, were alternating toe prints pointing in and calling up a picture of their owner mincing along in Bill's well-known way. Of course, a pigeon-toed man shouldn't choose bank burglary as a vocation."

"The bank 'yegg' now works pretty steadily month in and month out," Brown testifies. "I think the widespread purchase of Liberty bonds had much to do with this change. When banks began to invite customers to leave their bonds with them for safe keeping, the yeggmen took notice. It was common knowledge, too, that holders of individual safety deposit boxes were storing their war bonds in them. The unregistered Liberty bond looks 'sweet' to the 'yegg.' It has a large value, is hard to trace and is cashable almost anywhere.

"The coming of the automobile and the gas torch favored the 'yegg' as against law and order and gave him an advantage which regular police systems and all additional organized agencies, semipublic and private, have been unable to overcome entirely. The fast motor car, to be stolen almost as needed, made daylight bank holdups not only feasible, but fairly easy, and also facilitated the operations of night yeggmen, who could do their work and be a hundred miles away from the scene in a couple of hours. The gas torch challenged the safe makers, making light of bolts, bars and steel walls. The weakening of defense armament and the increased facility for get-away, enabling the yeggmen to reach the larger cities within a few hours after the smash and bury themselves against discovery—these point to the need of creating in the smaller towns unofficial organizations to function promptly in case of a bank raid.

"In other words, as it looks to me, direct co-operation of citizens outside the bank is necessary to beat the 'yeggs.' They did it right in Northfield, Minnesota, back in the seventies when the James-Younger band raided the bank there. You'll recall the gang was routed and its leaders captured. It has been done as successfully in various cities more recently.

"Cool-headed men in stores, offices or homes near the bank get together in an agreement to keep arms at hand and to act in concert in case of attack on the bank, day or night. Their places are connected by electric signal systems operated from inside the bank, probably by some act of the 'yeggs' themselves. The success of such a plan depends, of course, on the quality of the men working it; they must keep their heads, know what they are about—and take care not to shoot the wrong man."

The city and harbor of Rio de Janeiro.

An American's Impressions of Beautiful Rio de Janeiro

Drives of Magnificence Skirt Bay of Brazilian Port

By HELEN GRACE WHITE

JUST as the sun was slipping behind the mountains on a glorious clear November afternoon, our boat passed the quaint old fortresses of Imbuhy, Santa Cruz, Sao Joao and Mallet and entered the harbor of Rio de Janeiro. Never shall I forget the thrill which seemed to play tag with itself up and down my spinal column as I caught my first glimpse of Guanabara Bay and the city of Rio. The beautiful bay, so calm and tranquil in its rockbound setting, glistened like a precious gem as its sapphire waters caught and toyed with the golden glints of the dying sun. Beyond, the sky was aglow with radiant crimson and yellow, streaked here and there with a splotch of old blue and lavender; delineated against a flaming background were the lofty old mountains, flat-topped Gavea, Andarahy, Tijuca, Corcovado, and the Organ Mountains, all cloaked and resplendent in their royal purplish robes, their serried peaks stretching up to the heavens, with now and then a lonely palm tree standing like a silent sentinel over all the world below.

Squatting for miles along the curve of the bay and straggling up the hillsides, lay the city, burnished with old gold and copper at that hour. How picturesque it appeared with its brightly tinted houses and myriads of reddish tiled roofs, with here and there a villa perched gingerly upon some outstanding peak or daringly cleaving to a rocky cliff. There is nothing more radiantly beautiful than a tropical sunset, and Rio at this hour is simply ravishing.

Inasmuch as our boat happened to have trouble with its rudder and was forced to be towed into port by two small tugs, the passengers were afforded ample opportunity for viewing Rio from the bay. In the excitement of once more seeing land, everything else was forgotten, even dinner, and both sides of the ship were lined with passengers silently regarding the city and feasting their eyes upon the beauty of the scene which revealed itself.

When one first glances around the bay, which opens toward the south, it is difficult to realize that it is about 100 miles in circumference, for its vast magnitude is disguised by a large number of points, islands, projecting rocks and miniature bays. To the left, near the harbor's entrance, stands forth the famous Pao d'Assucar (Sugar Loaf), a great conical rock more than 1,300 feet high, a mute but ever watchful guard. Stretching from the Sugar Loaf may be detected a tiny black thread outlined against the sky, and on closer inspection one may observe a cable basket, capable of carrying 20 persons, suspended upon this thread and steadily mounting to the very peak of the rock. Again we see displayed the inherent tendency and desire of the human race to rise.

As Night Falls on Bay

GUANABARA (arm of the sea) is the name sometimes given to the bay. It was so named erroneously by Gonzalo Coelho when he visited it for the first time, on January 1, 1502. Mistaking it to be the estuary of a great river, he called it Rio de Janeiro, or River of January. The people later became known as Fluminenses or River Folk, although they are miles away from even a good-sized creek. Now, however, only the people who live in the state of Rio de Janeiro across the bay are called Fluminenses, and the inhabitants of the city of Rio de Janeiro, the federal capital, are called Cariocas.

While the boat was still in the middle of the harbor, the city gradually became enshrouded in darkness. One by one the lights appeared, until presently the city was but an onyx background studded with thousands of little diamonds, flashing and gleaming in the most alluring manner.

At length the little tugs succeeded in pushing the great ship against the quay. Friends of a fortnight bade one another regretful farewells, the best of friends perhaps never to meet again, for friendships on board an ocean liner are like the ships that pass in the night.

Animals of Midnight

A GREAT rush of dark-skinned, greasy looking "ganhadores" or stevedores sprang on board and screaming their unintelligible Portuguese, ruthlessly seized all visible handbaggage from the bewildered passengers. Everyone was pushing, shoving and perspiring in their effort to pass the customs officers, who stood at the passageway like granite rocks insisting that the contents of all pieces of baggage be revealed. It was almost impossible even to locate one's belongings in the crowd, and every time a suitcase was opened a piece of masculine or feminine apparel fluttered out, or a tooth brush was precipitated upon the deck, the frenzied owners diving after their sundry possessions in deep chagrin. Finally someone gave us a mighty push; we literally slid down the gangplank and presently landed almost in a heap on the dock. We were in Rio!

A taxi whirled us at the customary terrific rate of speed of Rio's taxis along the beautiful Avenida Rio Branco, and began to mount the steep winding hill of Rua Dona Luisa; after considerable puffing and panting it attained the heights of Santa Thereza where we had our first view of the city below.

As we stood on a terrace flooded with the lucent light of a full moon and gazed through the delicate filigreed leaves of a great grevelia robusta tree at the flickering lights of Nictheroy across the bay, the illuminated city below, and the somber mountains around, it really seemed as though we had been transported into fairyland. Rio is surely a city of lure and romantic charm.

The first thing that impressed me upon the night of my arrival in Rio was the midnight concert, or rather orgy, in which the native dogs, cats, cows, roosters, peacocks and numerous other unknown creatures indulged. The shrill whistle of the midnight guard, which at first filled one with terror, seemed to be the signal which started the party, and for miles around every bird and animal joined in, each contributing generously in its own particular way. I was quite amazed because here in the United States even the smartest and most ambitious rooster never thinks of rousing himself before daybreak. However, I soon discovered that practically every house in Rio was guarded by a dog and that the midnight concert was a nightly performance.

Rio de Janeiro, the capital of Brazil, is located on the northern edge of the federal district of the same name, the latter being surrounded by water on three sides and the state of Rio de Janeiro on the north. The city of Rio occupies 61 square miles of coast lands, part of it touching Guanabara Bay and part facing the Atlantic. In 1920 it had a population of 1,157 873 of which it is rather interesting to note that 1,066 were from the United States, 2,057 from England, and 236,006 from various parts of Europe. The climate, generally speaking, is mild and equable, ranging from 60° to 90° Fahrenheit. Their hottest and rainiest season is from December to March, and although the days are about the same as ordinary summer days in New York or Detroit, the evenings are always very cool and comfortable.

The sanitation of the city is splendid. Although at one time Rio was considered to be a very unhealthy place of residence and a veritable breeding place for yellow fever germs, it is now, due to the work begun in 1892, particularly by Dr. Oswaldo Cruz, a great sanitation expert, one of the healthiest localities known. Tropical diseases have practically been eradicated. Since 1903 sixty million dollars has been devoted to the transformation of Rio from a dirty, filthy city to the Eden which it is today. A quay was built for the boats to come alongside, the sewage system was renovated, the water supply increased, several hills have been removed, the beautiful Avenida Rio Branco was carved out of the very heart of the city and a number of splendid boulevards have been built along the bay.

Rio is enchanting beneath the mellow lamp of the moon, but it is even more beautiful in its glorious iridescent day dress. Color runs riot—the pink, lavender, white, brilliant blue, and yellow houses, topped by bright red roofs; the gardens filled with great trees of purple bougainvillea, the flaming flamboyant, the rose and red hibiscus, the violet manaca, the cassia covered with golden clusters, hedges of varicolored crotons, the epomaea with its scarlet waxy blossom and a profusion of roses, begonias, pinks and geraniums. These combined with the emerald green vegetation, the terra cotta soil and the deep turquoise of sky and sea, make Rio as multicolored and fascinating as a rainbow.

Streets Are Picturesque

THE streets are quaint and picturesque, lined as they are with houses of all the various types of architecture—Portuguese, Spanish, Japanese, Moorish, Italian; in fact, the architecture is as variegated as the colors. The homes with their romantic little balconies, friezes, stucco sculptory, and fantastic paintings on the exterior are very different from those seen in the United States. Instead of row after row of houses which look as much alike as so many peas in a pod, each little house seems to be a world within itself, surrounded by a high wall and entered through an iron gate only after due consideration on the part of its owner. The heavy iron shutters on the windows are so frequently closed that a visitor often wonders whether there are people living within. Screens are either unknown in South America or the people are too proud to use them, for apparently the inhabitants prefer to entertain the insect life of the country at the family board. However, for some mysterious reason, the insects seem to know their place, except for a few extremely brazen ones, and it is seldom that more than one or two bats drop in for the evening repast.

One of the most surprising features of the city is the number of homes which cling to the hillsides and are entered through the roof; or those which tower upward and are reached only after climbing hundreds of stone steps, or by an elevator. One would think that the owners would be mere shadows after a few weeks, but apparently these cliff dwellers thrive quite as well as their neighbors who live on the level patches.

Sweet Sellers of the Street

MOST fascinating are the narrow, winding, cobblestone mountain roads, with virgin forests sloping down on one side, and massive retaining walls towering up to the magnificent villas and chateaux on the other side. One can always hear the noise of the black-skinned natives as they clatter along the rough cobblestones in their wooden "tamancos," heel-less, wooden-soled sandals, somewhat resembling our bath "mules." The natives are usually leading patient little donkeys with great burdens on their backs, or driving the slow methodical oxen. The odd sight of the natives walking along in the most nonchalant manner and balancing everything from bread to the kitchen stove on their heads never ceased to astonish me. How they perform this remarkable feat and never lose their loads is still a mystery, but I suspect that it is an art cultivated from childhood.

The vender, singing his wares and clapping his hands at the garden gate with large baskets hanging from his shoulders, or as I observed one man of artistic temperament with onions gracefully festooned about the upper portion of his body, seemed very strange. Also the men who stood in the streets selling "doces" or sweets, never failed to interest me. These men have little portable glass show cases, which contain small pies, cakes and sweets, and upon every corner in the downtown district they have set up their stands, doing considerable business, for the Brazilians are extraordinarily fond of "doces."

The principal business street of Rio de Janeiro, the Avenida Rio Branco, cannot be surpassed by any street of its kind in this country. This beautiful avenue crosses the shallow peninsula occupied by the commercial district, beginning at the Monroe Palace, which served as the Brazilian quarters in our St. Louis Exposition and extending for a mile and a quarter to the Caes Pharoux or quays. The central paved roadway is 120 feet wide and the sidewalks are about 20 feet in width. The walks are most attractive, being in the Portuguese style of mosaic work, constructed out of small squares of black and white stone and put together in the most intricate designs. At the edge of the sidewalks placed at prescribed intervals are trees and ornamental lamp-posts. Along the center of the avenue are mosaic parkways and beds 16 feet long of Pao Brazil trees. There are also 55 posts each bearing a trio of arc lights. The Brazilians spare themselves neither time nor money in making their surroundings as artistic as possible. Along this avenue are many banks and commercial houses of fine architecture, also the National Library, the Art Museum, the splendid Municipal Theater and the Supreme Court building, an edifice of rose-colored stone and marble very ornately decorated without and within.

There are a great number of jewelry shops which have the most extensive and elaborate display of diamonds I have ever seen in any city. The Brazilians are very fond of decorating themselves with jewels and one is completely overwhelmed by the vast number of mammoth diamonds which are shown in the stores. One is quite dismayed, though, to find the prices on almost all articles except jewelry very much higher than in the United States, even at the present exchange.

Drives Along the Shore

IT SCARCELY seems possible that any other city in the world could have such beautiful driveways as Rio de Janeiro. Skirting the shore for miles with the bright white sands, the waves roaring and rushing into the shore, the broad mosaic walks on one side, parkways filled with tropical palms and flowers in the center of the paved roadway, and on the other side the show residences of the city, these driveways are of unparalleled loveliness in the daytime. But in the evening when they are bordered with thousands of lights strung around the curve of the bay, forming a tiara of pearls with their reflection intermingling with that of the moon and scintillating on the ebony-like water, the drive is entrancing.

On a Sunday afternoon or in the early evening vast crowds of Brazilians promenade along the boulevard walks skirting the sea. The girls, arrayed in their finery, stroll along in groups of two or three, and the "cavaleiros" also saunter by in small groups. Sadly enough, however, it is the Brazilian custom that unless chaperoned the youths and maidens cannot walk together. Perhaps it is not strange that the gentle art of speaking with the eyes has attained such perfection in Brazil.

Surf bathing is a favorite sport in Rio and there are many lovely beaches with soft musical names such as Botafogo, Flamingo, Formosa, Leme, Ipanema and Copacabana. A large number of Americans live in the suburb called Copacabana, where their little bungalows are a welcome touch of Americanism.

Rio's Setting a Thing of Beauty

THE Brazilians will never allow a foreigner to escape from Rio before he has made the trip to the top of Corcovado (the hunchback) where a splendid panoramic view of the city and bay is obtained. To arrive at this peak one takes an electric car up a ridge of Corcovado called Sylvestre; the car winds around the hillside affording the passengers an enchanting outlook upon jagged cliffs, a dense tangle of tropical verdure, beautiful gardens and trickling waterfalls. At an altitude of seven hundred feet one changes to a cogwheel railway and pursues the remainder of the journey in a train run by electricity, having four cables and an engine equipped with six kinds of brakes. The train crosses the valley of the Sylvestre stream on an iron viaduct of three arches, each 80 feet wide, supported on iron pillars, and begins its upward climb, later crossing two more bridges. The mountains and ravines are just a wild tangle of tropical vegetation with great ropy vines festooned from tree to tree, thick green mosses, ferns, mighty forest palms, flowering trees, scarlet, purple, white and gold; crystalline waterfalls gurgling along bare rocky patches on the mountain side, a fleeting glimpse of shimmering bay, somber green treetops below, forbidding crags above, and the delicious fragrance of wild orchids and begonias continuously wafted in and brushed against the nostrils. Finally the train reaches the very brink; the passengers alight and ascend a hundred or more stone steps to a little Chinese pagoda. Here one can walk out to the edge and contemplate a sheer drop of 1,700 feet.

Old Mother Nature was in her kindest mood when she created the setting for Rio de Janeiro, with its combination of verdure-clad mountains, pellucid bay, and tropical vegetation which can nowhere in the world be excelled. A naturally artistic people have spared no pains in beautifying their city with picturesque homes, gardens, parks and driveways.

Revenues of the Panama Canal are now running about $2,000,000 a month.

Gold valued at $1,806.89 was recovered from a trunkful of black mud purchased at a sale of unclaimed express by a buyer in Omaha, Nebraska, who was ridiculed for his purchase until a chemist's analysis proved its value.

The serving of the flesh of wild birds protected by the migratory bird treaty act with meals in hotels, restaurants or other places is unlawful.

"Our laws have become so numerous that it often costs a man a hundred dollars to get a shilling's worth of justice, and misses of it at last."—*William Manning,* 1798.

The 20,000 inhabitants of Bermuda depend for their water supply upon the rain that falls on the roofs of their coral houses and flows into storage tanks.

Iceland has factories for the preparation of herring flour which is highly prized in Norway as a strength food.

The Piccadilly Circus Station of the Underground Railway of London was used by 1,500,000 when opened in 1907. Last year the number of passengers was 18,000,000.

Many species of spiders migrate by "ballooning." The spider stands in an open place, with the body elevated, and projects from the spinnerets a line of silk which continues to issue until the spider feels the pull on it by the wind. It then releases its hold and clasping the line is borne away by the wind.

It costs $4,500,000 annually to man the League of Nations. At its last meeting the question of defraying expenses was the most troublesome problem that arose.

In 1920 the American Federation of Labor had 4,078,740 members. In 1923 it had 2,926,468 members.

An Indian fish trap in the Charlton River, Missouri, which has been in use for 100 years, has just been destroyed by the game and fish commissioner.

Four per cent of the hogs on farms in the United States died of hog cholera last year.

The ancestral home of John Adams and his son, John Quincy Adams, at Flors, Northamptonshire, England, second and sixth Presidents of the United States, has been purchased by the Sulgrave Institution.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

So accurate was the firing of the sixteen-inch guns by recruit gunpointers, aboard the United States battleship *Maryland,* that at six miles the second salvo split the raft bearing the target.

Mr. Casey, made famous by Thayer's poem, "Casey at the Bat," is E. Robinson Casey, now a business man of Syracuse, New York. The famous game was played in Minneapolis.

Smut-resisting wheat has been developed by the Department of Agriculture through crossing Florence and Turkey varieties, the former a smut-resisting spring wheat from Australia. It is more adapted to the humid regions than for semi-arid regions.

Ninety per cent of the parcels sent to Russia labeled as relief goods are in reality merchandise intended for sale, according to charges made by the Russian Red Cross.

An expedition is outfitting to ascend the Fly River in New Guinea. Five expeditions have already gone up this mysterious waterway, and none has returned.

A suicide-proof fence will be built around the New York Central Park reservoir.

Two bird dealers of New York City dyed more than 1,000 English sparrows yellow and sold them to residents in the Bronx for Hartz Mountain canaries.

In a "get out the vote" campaign put on in Detroit during a recent election, 150 telephone operators inquired of 70,000 subscribers whether they had voted yet.

"An educated person is a man who can read a newspaper without being humbugged by it."—*St. John Ervine.*

Dean Inge protests against the movement for a celibate clergy in the Church of England, pointing out that Nelson, Drake, Sir John Moore, Warren Hastings, Sir Christopher Wren, Sir Joshua Reynolds, Jenner, Charlotte Brontë, Oliver Goldsmith, Tennyson and Cecil Rhodes were all children of clergymen.

Only 115,085 children were born in Scotland in 1922. Fifteen women over 100 years old died in the same year.

The *Wall Street Journal* estimated a maximum of 10,250,000 bales of cotton in the next crop. The United States Department of Agriculture estimated 11,015,000 bales, which it later reduced to 10,250,000 bales. "Is Washington exactly the place to talk of Wall Street 'disseminating false information in order to manipulate prices?'" asks *Barron's Weekly.*

I should advise ladies always to avoid artists who are in search of new sensations and emotions either in friendship or love . . . . Never fall in love with a genius, ladies, nor a man of temperament. All that is left of temperament at home is temper."—*Jacinto Benevente,* Spanish playwright.

A steward, passing through the main hall of the *Leviathan* when she was in a rolling sea, put out his hand to steady himself. He chanced to press a panel and the ornamental woodwork section slowly opened into a secret room which proved to be a barber shop. Here were discovered picture postcards of the former German kaiser, his son, the crown prince and other royal personages.

The two most wonderful things in America are New York and the Grand Canyon, in the opinion of Vicente Blasco Ibanez, Spanish author. He was always thrilled when he saw the towering skyscrapers of lower Manhattan lighted in the early evening.

WITH CHRISTMAS NEAR IS WORRY FAR BEHIND?

¶WHAT TO GIVE!

¶To many persons selecting suitable gifts is a real worry.

¶A subscription to THE DEARBORN INDEPENDENT, with a check, written and mailed now, solves what to give.

¶Inexpensive, yet carrying a real message, THE DEARBORN INDEPENDENT represents an ideal Christmas gift. For fifty-two weeks it will be a reminder of your regard and thoughtfulness.

¶An attractive announcement card will be mailed with each gift subscription. Forward your subscription early, using the accompanying blank.

12-15-23

Enclosed is $............................covering Christmas gift subscriptions to The Dearborn Independent for the following:

Bobbed Hair—And the Work of the Hair Barons

Long Tresses of American Girls Worthless to Dealers After They Are Shorn

By E. L. M'COLGIN

FAMILIAR as it has become, bobbed hair is still a problem in America. In some parts the problem is to undo the effects of bobbing. In other parts the question still is "to bob or not to bob." Fashions like these follow the popular song orbit; they appear in the congested centers first and gradually make their way to the more remote districts. Sometimes, like popular songs, they die before half the United States is aware of them.

Where did bobbed hair come from?

Shrewd people early guessed that the hair market had become short of hair, and that to supply the need a new fashion was started by which girls would freely sacrifice their precious locks. For (these people reasoned) a girl who will not part with her tresses for love nor money will gladly part with them for fashion's sake.

Certainly they part with them—no doubt about that; but the theory that the bobbing craze was started by the hair dealers, for the sake of getting a large stock of hair, is faulty.

And here is the reason: the clippings from American beauty shops are not usable again. The American woman's hair has been so hotly curled, so permanently waved, so deeply dyed, so desperately dosed with tonics and nostrums, that when long tresses of it are cut off in the process of bobbing, it is worthless. Like the sweepings of men's barber shops, the sweepings of beauty parlors have no high uses. For the hair of foreign women uninitiated into the arts of the beauty parlor, fifty cents a pound is paid; the American woman's hair would not bring a cent a pound.

Where, then, did the habit of bobbing come from? If it cannot be attributed to the shrewd trick of the hair merchants, what then is the answer to this new and widespread fashion?

Listen, ye maids and matrons of America—

Bobbed hair originated in the munition factories of Europe.

Done for Safety's Sake

FOR reasons of safety the munition centers of France and England required all their women workers to cut their hair short. Of course, being only a factory order and not a fashion order, the ladies thought it was too terrible for words. But because it was "the war" and because obedience to the law was essential to patriotism and munition production, they complied. It was their sacrifice; in the spirit of sacrifice, and not as glowing followers of the fashion, they laid their hair on the altar of their countries.

So much for the origin of bobbed hair. The hair barons must be freed of the charge of indulging in a mercenary crusade.

But it remains to be explained how the fashion spread, and this is not so easy. That is, it is impossible to say how much of the vogue was due to the sheer contagion of fashion, and how much to reasoned action. Women who cannot be accused of any sort of fashion insanity say much for the comfort and freedom of bobbed hair. Perhaps their word will have to be accepted as indicating the reasonableness of the mode in many cases.

But this must be said: there are two kinds of hair, apparently; one kind will "bob" very prettily; the other kind will not. It is perhaps best to draw the veil over the tragedies of the latter class.

But it is the hair that does not bob prettily that is today the hope of the hair-sellers. When the fashion of bobbing first came in, the hair market was greatly depressed. But now the stage is being set for the return of styles that will require "transformations," "switches," curls and puffs. And the hair merchants are looking forward hopefully to the requirements of women who are expected to bow obedience to the new fiat of fashion and hasten to the purveyors of artificial hair devices to conceal the havoc wrought by the shears.

Perhaps the word "artificial" in that connection is a trifle harsh. The dealers prefer to use the expression "extra hair." These matters must be handled with great delicacy.

Yet there is a business side to this matter of hair and its styles, and the more a woman knows about it, the better able she may be to guide herself in the flurries of fashion which unexpectedly beset her.

Here followeth, then, some facts about the business side of the fashion of hair.

The peasant girls of Europe, whose hair has only been combed and brushed, furnish the best raw material for the hair goods manufacturers. The modern rape of the lock is accomplished by cutting about a pound of hair from the heads of the peasant girls. This leaves sufficient hair to permit the seller to retain her natural appearance.

The hair cutters and buyers go forth from London and Paris making a circuit of all Europe. Announcements of their forthcoming visits are distributed in advance and the shearing of a community's surplus is quickly done.

Brittany and Auvergne, Scandinavia and Rumania supply the blond hair. Germany furnishes brown and Switzerland drab hair. The darker shades come from the Mediterranean countries, principally Italy, Sicily and Spain.

Russia formerly gave the world a large clip of light hair, but the Soviet's foreign trade monopoly seems to have overlooked this natural resource.

There is no substitute for human hair. It is quite strong, one strand being capable of supporting 178 grams. Blond hair, the strongest of all, averages 182 to the square inch as compared with 162 for brown and 147 for black. Straight hair is the longest without much variation between the sexes.

London and Paris are the Old World capitals of the human hair business. London is probably the leader. Because of the lower wage scale and the patient craftsmanship of the workers most of the goods used in America are made up abroad. However, the numerous large New York houses do considerable manufacturing in addition to disposing of a tremendous volume of imported merchandise.

American manufacture of hair goods from the imported raw material increased 228 per cent between 1914 and 1921. This increase was decidedly cut down by the inroads made by the bobbed hair craze. American manufacturers doing a hair business of $5,000 or more a year number 128, with an average total employment of 1,666 persons, the annual pay roll being $1,853,000. The raw product which they use is valued at $6.734,000 and a value of $4,218,000 is added by manufacture, the complete output of the hair business in the United States is valued at $10,952,000. There were also 42 smaller concerns whose combined output was $108,500.

These figures are entirely apart from the importation of manufactured European hair goods, and also the Chinese hair net business, the latter exceeding $50,000,000. Hair nets make an interesting subject worth some attention.

The war enabled New York Jews to wrest control of the Chinese hair net industry from Germany and Austria.

The German seizure of Shantung province of China had resulted in German development of the Chinese hair net manufacture.

The Teutons devised an elaborate ruse to avoid others detecting their new source of profit. German firms supervised the manufacture of hair nets in Shantung communities, but the product was secretly shipped by parcel post to small German villages where agents reshipped it to Strassburg. The business world continued in the belief that these Chinese hair nets were another product "made in Germany."

This maneuver outwitted even the New York Jews until the war upset the German scheme.

The hair net has a history worth recounting.

Growth of Net Industry

THE so-called "waterfall" hair dress of the seventies, when women's hair was bunched at the back of the head over a "rat," made a net necessary to hold this creation in position. The Austrians devised a chenille net to perform this function. The French came forward with a silk net much lighter and preferable. The Austrians, compelled to outguess the French or sacrifice the business, hit upon the net made of human hair. This was the trade which their aggressive German cousins took over when Shantung gave them a source of cheap hair and labor that Europe could not match.

However, the Germans did not widen the market for their Chinese hair nets to an extent comparable with their opportunity. It is estimated that the present Jewish hair barons have increased the American use of hair nets seventy-five or eighty fold. Not eighty per cent, bear in mind, but *eighty fold*—eighty times over.

The exploitation of the American consumer of hair nets is another section of the story and is evidenced by the strong-arm tactics employed by American hair net importers to prevent the Chinese from making more of the so-called double nets than they do. The double net, being double strength, does not have to be replaced so often, and thus puts a damper on sales.

The Chinese are honest work people with an inborn sense of thrift. They began to increase the percentage of double strength nets which they made, because they thought it helped the customer's purse. This caused consternation among the American trade. Emissaries hastened to China to devise ways and means *to keep the production of double strength nets down to one in four.*

There are indications that the Pekin government was "seen" and that a minister of state was induced to go to the coastal hair-net-making centers and place a ban upon increasing the output of double nets. The heathen Chinee was too honest for Broadway.

The importers believed that if American women were permitted to wear these double nets, the increasing production would slow up the turnover, and the hair-net business would drop to one-tenth of its volume, or roughly from fifty million dollars to five million dollars.

Although the hair nets are made in Chefoo and Shanghai, the raw Chinese hair is first sent to America. Here it is sterilized and bleached and then dyed the eight desired shades. This processing entails fourteen applications to the raw hair. It is then returned to China for conversion into hair nets. The hair of a certain white yak is said to be mixed with several shades to produce a silvery effect.

The Chinese hair net material does not come from cues, which were more or less generally abolished a number of years ago. The hair is obtained from barbers' combings. Even when cues were worn it was the combings that were marketed.

The net making is done in the autumn and winter when the crops have been gathered and the workers can turn to this labor. A skilled worker will make ten or twelve nets a day, knitting them together with a bodkin.

Would Squelch Bobbing

IT REQUIRES about one year to ship the raw hair to America, treat and return it to China, make it into nets and place them on the market. The profits are simply enormous—600 to 800 per cent on the invested capital.

Flushed with their success in obtaining such a volume and profit in the hair-net business through advertising and more subtle propaganda, the hair magnates are facing a real test of strength in their present effort to squelch bobbed hair in order to unload surplus stocks of hair goods.

Some prominent hairdressers assert bobbed hair has come to stay, predicting an even more general adoption of it. This view is also held by men's barbers who cut women's hair.

Others in the trade are firmly convinced that Barnum was right. They declare that within six months bobbed hair will be a thing of the past so far as smart-appearing women are concerned.

The motion picture dolls are to be the storm troops who will break down the present resistance to the sale of artificial hair. These movie queens get no money for featuring the new styles. They are said to be satisfied by the almost universal publication of their pictures, together with the usual laudatory remarks.

Readers of the daily press have been regaled of late with certain tragic consequences of mistakes or incompetency in a certain type of beauty parlors. Experts who have given attention to the whole subject have estimated that more than eighty per cent of the persons posing as hairdressing or beauty experts are incompetent. Enterprising Jews are extending chains of beauty shops throughout the cities of the country. Half-baked or worse operatives are practicing at the grave risk of their confiding customers. It seems to be the old story of exploitation practiced upon the trustful portion of the American people.

Cases of blisters being formed on the inner side of the skull with horrifying results have been the outcome of the blunders of careless, ignorant operators using hair waving and curling machinery. The human skull is jointed and permeable. Acids and metallic salts used by reckless hair dyers and cleaners have played havoc with the interior as well as the exterior of some heads.

The exhibition of a diploma of a rapid-fire beauty school does not necessarily signify expert ability. A physician of the highest class should be consulted before choosing someone to render hair, scalp and other skin treatment. A high fee for such a consultation is preferable to risking irreparable damage to one's appearance and health.

It is significant that the people of the new order who are accelerating the beauty shop business are aggressively opposing legislation that will safeguard their patrons. They are notorious masters of all the arts of propaganda, and, as a consequence, our busy, well-meaning legislators are frequently misled.

London is the location of the world's premier hairdressers. Their stern apprenticeship of from three to five years must be supplemented by about two years' service as an assistant. The London hairdresser must master chemistry and sufficient medicine to enable him to treat skin diseases. Furthermore he becomes proficient as a manicure and chiropodist. The master of an Old World establishment is presumed to know from personal experience the standard of work to require from his staff.

The English have an inflexible way of fixing the responsibility of persons rendering service of any sort. The London hairdresser whose patron suffers from incompetent work faces the swift and sure imposition of damages, if not harsher penalties, and also stands to forfeit his license.

A Pink Elephant, Chattering Monkey and a Stray Mongrel

Showing What Animate and Inanimate Objects Can Carry the Luck of a Ball Club

VICTORY

WHAT they had come to know as the Chicago jinx began to work on the minds of the Detroit players. Ever since Tyrus Raymond Cobb became manager of the team, Chicago had been the conquering enemy of the Tygers. To win five games from the White Sox in twenty-two played between the two teams was about the best Detroit had been able to accomplish. The White Sox were not a championship team. They were not a contending team. Their place, after the years of conquering that ended with a baseball scandal, was with the non-feared list in the second division.

But the White Sox could strike terror into the hearts of Detroit. No matter where they stood in the race, they were always able to trim Cobb's team. They might be crippled or they might be in the thickest kind of slump, but any time they opposed Detroit they broke out like champions. Every break went to the White Sox and everything turned against Detroit. Beating Chicago became next to impossible for Detroit.

In 1922 the White Sox beat the Tygers seventeen of twenty-two games. The grip of the Gleason jinx was as tight as ever. And when a new season dawned and changes in the line-up of the two teams promised to alter matters, at least in the opinion of the veterans of the Detroit team, the same old problem confronted them; the White Sox were as tough as ever, if not more so.

Now the Chicago team of 1923 was not the kind of team to scare any rival. Before the season it had been doped as the dark horse of the race, but after the season opened it did not look so terrifying and before a few weeks passed Chicago was decidedly not in the class of contenders. The White Sox were either in a bad slump to open the season or they were just plainly lacking in championship timber.

But for Detroit it was the same old team. The seventeen games that the Tygers lost to the White Sox in 1922 prevented them from joining St. Louis and New York and making it a three-team race for the pennant. And now, with a team apparently stronger, the White Sox were up against the Tygers with the same marked degree of success as before. Their power over Detroit was uncanny.

The thing became a nightmare with Cobb. He knew he had a club points and points better than Gleason's, but that did not beat Chicago. He knew the Chicago pitchers were not what they should have been, but still they were able to beat the Tygers. It was uncanny in the extreme.

"Victory" Breaks a Jinx

LATE in July, when the Tygers suffering from injuries and illness were having a run of tough luck, the schedule carried them into Chicago for a series of three games. Preceding meetings between the two teams had the same result and the Tygers won but a single game from the White Sox in the first three months of the season. So when they arrived in Chicago on a sultry morning in late July, they were hardly jubilant. They faced the team that had the Indian sign on them.

The players began gathering in the clubhouse about noon for the double-header. They made a disconsolate gathering. There was little life to the party. The door to the clubhouse was open, to provide better circulation, and through the open doorway came a cur, a mangy, straggling cur. Nobody paid attention to the mongrel and it probably would have continued unnoticed had it not strolled over to the bats and begun walking across them.

Now, if there is one thing sacred about baseball paraphernalia, it is the bat. Plenty of fights have occurred on ball clubs because one player took the bat of another player. Some of the mildest of men in baseball will battle to protect the virtue of their bats, and when this mongrel, product of one of the alleys of the black belt of Chicago, started walking across the bats somebody picked up a shoe to throw in defense of the bats and what charm they may have held. The object was to defend the hits the bats carried.

The shoe was never thrown for another player remonstrated. "Let the cur alone. It may be a sign of good luck. We can't do any worse against this club than we have been doing and this may be a change for the better. It must be luck for it can't be bad luck. There ain't room for any more bad luck."

They decided to try out the mongrel. Jimmy Duggan, trainer of the team, was instructed to let the dog walk over the bats until it got tired of the trick and then lock up the animal until the test had been made thorough.

Detroit went into the first game and for the first time since Cobb took hold of the team the Tygers began getting the breaks over Chicago. Everything broke in their favor and they won. As soon as the game ended the players rushed to the clubhouse and hauled out the dog. The animal was trotted back and forth over the bats, was hugged and fondled and promised many things if its luck held out through the second game.

The second game that afternoon was a repetition of the first. Everything came Detroit's way. No matter what the Tygers did, it seemed to help and no matter what play the White Sox made it apparently hurt. Detroit won. No sooner did the game end than the Tygers rushed into the clubhouse and brought out the dog. Nothing but kicks and cuffs had been the stray cur's lot until this moment, but now the dog was granted only caresses. A clubhouse boy was sent to a near-by drug store to buy some flea soap and anti-vermin powders. On his way he was instructed to stop in a butcher shop and buy a pound of sirloin steak, ground fine. Also, he was to go to a grocery store and buy a bottle of cream. On the boy's return the mongrel received its first bath and after being thoroughly dried and powdered was given a pound of sirloin steak and a bottle of cream.

The third and last game was played the following afternoon. Detroit's luck continued. The Tygers won that game. And that afternoon, in the clubhouse, the cur was christened. Its name became Victory. They purchased a dog harness for Victory and a traveling box, and when the team departed the following afternoon for Washington, on its second eastern trip of the season, Victory, freshly bathed, thoroughly fed, well powdered, beautifully harnessed, went along, leading the march to the Pullman.

At the same station were gathered the Chicago players, awaiting a train for another section of the East. They saw the dog and noticed the attention paid the cur. Gleason appeared and he came over and asked Cobb where he had got the mongrel. Cobb explained that it was the new mascot. Gleason wanted to know where Cobb picked up the dog and Cobb explained the circumstances under which Victory came into possession of the Detroit team. "Why, that's the cur I kicked out of our dressing rooms the other afternoon; I found it in my locker," said Gleason. "Yes, and you kicked all your luck out of your dressing room into ours," answered Cobb.

The players were convinced by this time that they owed their sudden turn in fortunes to Victory. The dog belonged. They would as soon leave all their bats as the cur. The power that Victory carried, the uncanny charm, was no longer a matter of conjecture but an established fact. It could not be questioned any more; it was proved beyond doubt.

Things went well for the Detroit cause in Washington and then in Philadelphia. From there the team went to Detroit, playing a Sunday game on Navin Field and jumping back East that evening to continue the series in Boston. Victory accompanied the team to Detroit but in the hustle and bustle of breaking away from Detroit immediately after the game to reach Boston in time to play on Monday afternoon, Victory was overlooked. The players did not discover until they were on the train, bound back East, that Victory was not among them.

Boston beat Detroit three games. It would not have happened had Victory been along. All three games were lost by the margin of one run. Several times in each game a break in luck would have given Detroit the victory. No one was to blame but the missing mongrel; any player could tell you that and not alone could, but all did.

In New York it was much the same story and no other cause could be assigned the change in luck than the absence of Victory.

The club returned to Navin Field Victory was in the clubhouse, fat and apparently happy, unmindful of the tragedy its absence had caused. With Victory returned, the club once more became confident. Detroit simply could not lose a series while the mongrel was about.

The Fight for Second Place

THINGS changed. The Tygers once again were successful. They got the better of the series with the Eastern teams and after they left Navin Field Chicago once more came to Navin Field and once more the Tygers swept the series. Gleason could not understand it. Gleason had forgotten about Victory, the cur dog that he kicked out of his locker and out of the dressing rooms at White Sox park one hot and stuffy July afternoon. But Victory was in the Detroit clubhouse working a mongrel's charm over the Tygers and putting the jinx on the White Sox.

That was in the first week of September and from there let us jump to the first week in October. A break in luck has made Cleveland waver. Detroit, with her regular line-up restored for the first time since the opening of the season, started spurting late in September and is going strong. On Saturday, October 6, Chicago twice beat Cleveland and Detroit, by beating St. Louis that afternoon, went into second place by the margin of one-half a game.

Cleveland closed the season at home on Sunday afternoon with Chicago while Detroit played St. Louis. To finish second Detroit would have to beat St. Louis unless Chicago could again beat Cleveland. Cleveland's only chance of ousting Detroit was to beat Chicago while St. Louis defeated Detroit.

It was a glorious afternoon. And, for Detroit, it was the biggest baseball day of the season, the most important game. The Tygers started badly. The Browns were getting the breaks and making them; the Tygers simply could not do a thing correctly. St. Louis was leading. The Tygers seemed doomed. And, in Cleveland, the Indians were beating the White Sox. Suddenly, late in the game, the break came. Detroit tied the score and, in the ninth, the Tygers hammered out a victory in the most thrilling finish of the season.

You ask what players get the credit for landing Detroit second? You want to know who finally snatched out that game and made second place and a big pile of money secure for Detroit? Well, it was none other than the mongrel product of the alleys of Chicago's black belt, the cur called Victory. It was Victory that saved Detroit from the second division and finally carried the team into second place. The Tygers got there by the narrowest possible fraction but still they got there.

That is the story of Victory. We doubt whether the story will go well at a Rotary or Kiwanis club dinner. We doubt whether the members of the Young Men's Business Club will think of it with more than bored tolerance. These men are tied to efficiency. They go on hard facts. They have set principles and luck plays no part in their achievements. The cold and calculating men of business have no use for superstition.

Monkey Brings Bad Luck

BALL players are also efficient but the ball player plays hunches. They all do, some more than others but all of them to a certain degree. The ball player keeps up morale by giving superstition free rein. He finds various things that become important factors and cogs in his success. We still have to meet a ball player utterly lacking in superstition.

One eastern trip last season was disastrous for the St. Louis club. Things were breaking badly, the team was losing and there seemed no way of tearing loose from the slump. When the Browns reached New York they were exhausted.

Johnny Tobin and Pat Collins decided one evening to take a 'bus trip through Chinatown to forget the reverses the club was suffering. They strolled about Chinatown and there, at a corner, they saw an Italian with a performing monkey.

"That's what we ought to have on our ball club," said Tobin. "It would bring us luck. We got everything but a monkey and we ought to have one of those."

"Why not buy the ape and take him along?" suggested Collins.

They approached the Sicilian owner and asked for a price. He did not care to sell his pet but when the price mounted to $35 he consented.

Tobin and Collins took the monkey back to the hotel. They finished their series at the Yankees' Stadium the following afternoon and won, so the monkey got immediate standing and when the team left for Boston that night the monkey accompanied the squad.

The Red Sox won the series in Boston and from there the St. Louis Browns traveled to Cleveland. They lost the first game and things did not look so well for the monkey. When they lost the next afternoon it was certain that the ape had lost its charm. That seemed to be the unanimous opinion in the clubhouse after the game. At any rate, it was decided that the monkey had to be got rid of and since Tobin and Collins brought the jungaleer into the St. Louis circle they were asked to get it out.

"But we're out $35 on the ape," remarked Tobin.

"Cheer up, we may be able to get part of it back," consoled Collins.

The two players took the monkey downtown. They

(*Concluded on page 13*)

Reserving Right to Deny: A White House Tale

It's a Sinecure, to be Sure, Being a Washington Newspaper Correspondent, But, as You May Well Ask After Reading This, How About the News?

By BURT P. GARNETT

EVERY Tuesday at half-past twelve, noon, and every Friday at four in the afternoon, the President of the United States receives and confers with the newspaper reporters, or, rather, a carefully selected group of reporters for bona fide newspapers and wire news services (such as the Associated Press); men who are members of the White House Correspondents' Association and who have taken and sworn to the awful oath of that association that they will not divulge what the President says at any such conference.

Lest any one play the scoundrel and write a piece for a newspaper or wire press association in which he quotes the President as saying something, it is understood by all of these men that the offender will, or may be, branded as a falsifier—or liar, if that briefer term makes the meaning clear. In other words, the President of the United States has issued a blanket denial in advance. It is as if these men went into the White House, were closeted with the President for a half-hour or so, without a word having issued from the mouth of the Chief Executive.

Let us deal with a particular White House conference on a particular date, for example, Tuesday, November 13, 1923. Prior to that date, supporters of the former kaiser in Germany had made a move toward the restoration of the monarchy and the overthrow of the present, republican, form of government in Germany. Naturally, some of the newspaper reporters wanted to know if the United States Government would take official notice of the condition in Germany and if the monarchist movement would be approved, disapproved or what.

Under the rules (which, by the way, were set up and agreed to by the reporters themselves) all questions must be written in advance of the conference and sent to the President for him to look over. A question had been written asking certain things about the German situation.

No Quoting of the President

ON THE afternoon of November 13, the *Evening Star*, the largest and most influential newspaper in Washington, published the following news item:

> The United States Government will make no protests against the apparent efforts to restore a monarchy in Germany. Nor does this government officially oppose the return of the former kaiser or the former crown prince to Germany.
>
> In making known the government's position regarding the present trend of government and politics in Germany *an official close to the President* said today that it has always been the policy to recognize the rights of any other country setting up any form of government it so desires.
>
> It is realized, however, that the allied governments probably have a very proper protest because of the provision of the Versailles treaty, but inasmuch as the United States has no connection with the latter it is therefore in a different situation, and will not be called upon to join in any formal protest.
>
> Callers on the President today felt very certain that there is no likelihood of the United States Government's participating in any joint international inquiry or movement to solve the German reparations question.
>
> The announcement, made several days ago by Secretary Hughes, that this government would no longer entertain the idea because of the attitude of France seems pretty definitely to settle the matter.

The same story, or one very much like it, was carried by the Associated Press, the United Press and the International News Service. None of these quoted the President directly and, presumably, it will never be known whether the President actually gave the information contained in the story. It will be noted that "an official close to the President" said that it has always been the policy to recognize the rights of any other country setting up any form of government it so desires. It also will be noted that "callers on the President today felt very certain that there is no likelihood of the United States Government's participating in any joint international inquiry or movement to solve the German reparations question."

What Happens at a Conference

OF COURSE no one knows—or at least no one is supposed to know—just what the President said or just what prompted the writer of the article above quoted from the *Evening Star* to write the article. Presumably, however, someone told him something.

Let us visualize the conference scene. The accredited correspondents, numbering from thirty to one hundred and twenty-five, are standing about, waiting for the President to come in. They are not a particularly eager looking crowd. There is no straining to see the Chief Executive—as a matter of fact, most of the men look as if they were about to engage upon some dull and boresome but necessary task.

"Good morning, Mr. President," a few of them may have said—mind, we do not say that they actually said any such thing. As a matter of fact, some of them may have said, "How do you do, Mr. President." And, it is conceivable that the President made some courteous and pleasant reply, but, of course, his words can't be quoted.

Let us suppose that the President has selected a few of the written questions which he is disposed to answer. From here on, it must be understood that the conversation is wholly hypothetical and imaginary and is presented merely for purposes of illustration.

The President reads, "'What, if anything, is the United States Government going to do if the monarchy is restored in Germany?'" Then he gives his reply.

"The United States isn't going to do anything—or, at least, the Administration has no plans to do anything. It is no concern of ours what sort of government the people of any other country may set up. That is a matter for them to decide for themselves. The nations which ratified the Versailles treaty, of course, may be expected to take some action. But we didn't ratify the treaty and so there is no obligation upon us to do anything."

Suppose the President had used those words, "It is no concern of ours what form of government the people of any other country may set up." Suppose that the newspapers had actually published those words, directly quoting Mr. Coolidge, putting him on record. What might his political opponents have done? There might have been a chorus, crying "What about Russia? Why, then, does the United States refuse recognition to Russia?"

Obviously, such a state of affairs might require the President to do some explaining.

The present system protects the President and at the same time enables him to obtain publicity for the ideas that he wants to go out from the White House. It shields him from the actual publication of his opinions. Why should the President—or any President—want to do this? It cannot be for other reasons than that he does not want the public to know what he thinks; does not want to be answerable for the opinions that he expresses or may express.

He talks to the newspapermen, as individuals, safe in the knowledge that his words cannot be used against him. If he is directly quoted he can deny that he ever uttered such words, which is, of course, half true—he does not utter them *for publication*. The questions which are asked the President may not be quoted, since a reporter might write, "President Coolidge today refused to discuss the Mellon tax program," or some such matter, which would place the President in the position, before the American public, of withholding his views on a matter that is of great concern to the whole country. Under the system, the reading public is left to come to the conclusion that it never occurred to any of the newspapermen to ask the President what he thinks about Mr. Mellon's scheme.

Not Established by Coolidge

LIKEWISE, some one might write a question as follows: "What is your position on the matter of a bonus for the soldiers?" Nobody knows whether the President was ever asked such a question.

The American public had a better and clearer idea of the man, Woodrow Wilson, than it has of the man, Calvin Coolidge. And yet Wilson, during the major part of his second term, held no conferences—or not more than three or four conferences—at the White House. As a result, the reporters felt free to write what they pleased and they got, actually, more news from the White House than they now get. If the conferences were absolutely abolished and the President refused to see the newspapermen at all, more news might come from the White House, since, then, the President would be obliged to issue statements more frequently to keep himself square with the public—and the public does demand of the President that he do certain things in connection with his job and to make known his attitude on public matters.

A President who may be directly quoted goes on record. There can be no doubt about his stand. The phrase "it was said at the White House," blurs the outlines of the President's position and gives the public only a vague idea of how he stands on this or that matter.

The present conference system was not established by President Coolidge, although the restrictions placed upon the reporters seem to be a little more rigid than during the Harding, the Wilson and the Taft administrations. Under the Roosevelt Administration the reporters had very little sense of limitation.

A few self-respecting correspondents refuse to participate in the semi-weekly absurdities and refuse to attend the conferences, but no correspondent and no individual newspaper has had sufficient courage to lead a revolt against the system. No one would deny the President the right to refuse to see the newspapermen; but, since he does see them, let them ask him questions and give them answers, why in the world shouldn't they use what he says?

Visitors at the White House other than newspaper correspondents, bankers, lawyers, manufacturers, movie actors, politicians and other individuals, are made to understand that they are not to reveal what was said during their talks with the President. Shortly after Mr. Coolidge took office, "a spokesman for the Administration" warned the correspondents that some of his callers might not abide by the rule, whereat "an official close to the President" issued a denial in advance, asserting that the President would refuse to acknowledge anything that any visitor might say that he (the President) said.

The unfairness of this method is brought out by an incident which followed the visit of a certain railroad executive. This man, abiding by the rule, said nothing whatever about his talk with the President. At a White House conference, however, the reporters were permitted to say that "it was said at the White House," that Mr. So-and-so, the railroad executive, told Mr. Coolidge certain things. The certain things were set forth at length and published in newspapers all over the country. Later, the railroad executive, in a private conversation, said that he had been misquoted and that some of the things accredited to him he had not said at all. He was helpless. He could not have contradicted the President without arousing much unfavorable criticism of himself.

What the President does, the officers of the Cabinet also do. The President sets the fashion. The newspapermen are taken into the confidence of the Secretary of State, the Attorney-General and other members of the Cabinet in the same manner as at the White House. National and international affairs are discussed with them. Occasionally they are permitted to quote directly but when a Cabinet officer has a message he usually has it typewritten or mimeographed and the copies handed to the various correspondents.

The correspondents are, perhaps, as much if not more to blame than the executives. They drew up the rigid rules themselves and, in the case of the present Administration, they were not changed by Mr. Coolidge. "I am glad to say," the President wrote, "that they (the rules) are acceptable, and that I shall rely upon your association for the maintenance of the policy which they represent."

Slemp Amendment Disturbs

THE White House Correspondents' Association has been very much disturbed recently over an amendment to the rules written by C. Bascom Slemp, Secretary to the President, as follows: "Full authority is reserved by the Secretary to the President to make and enforce exceptions to the eligible list." The members of the association, bona fide newspaper reporters and press association representatives, object very much to the presence of publicity men, press agents, stock market tipsters and other outsiders at their conference with the Chief Executive. No one questions the rightness of their stand on this matter nor their protest when Mr. Slemp admitted to the press conference the publicity agent of the Methodist church. They raised a fearful row about it, and in so doing showed how completely they are caught and held in the grip of the system which suppresses news.

Most of them highly disapprove of the system. They have talked it over time and again but have made no effective protest and probably no very vigorous protest. Probably the leader of a revolt would get into trouble with the owner of the particular newspaper he represents and it is doubtful if a concerted, unanimous move to boycott the conferences at the White House would have the support of the publishers.

Take the political aspect of the situation into consideration for a moment. Hiram Johnson has announced his candidacy for the Republican nomination for President. If anything can be assumed concerning Mr. Coolidge, it may be assumed that he is a candidate for election to the position he now occupies. Senator Johnson's words are put on record. Any newspaper correspondent feels perfectly free to print anything the Senator may say. Any newspaperman who comes into contact with Mr. Coolidge feels bound, by his word of sacred honor, not to publish anything Mr. Coolidge may say.

It is a case of Mr. Coolidge's fortune and Senator Johnson's misfortune, perhaps, but it does not put the two candidates on an equal footing.

Hoping Against Hope

MR. COOLIDGE is considered by a great many correspondents the most democratic President they have ever known. There is absolutely no pose nor affection nor display of egotism upon his part. He is genial and kindly. He endeavors, in a somewhat ungraceful manner, to be a good fellow and to say a few witty things at each conference. This criticism of the method of holding press conferences is not a criticism of him in particular, excepting in that he does nothing about abolishing it.

The newspapermen deal fairly with all other public officials. As a matter of fact, they deal very generously with most of them. It is exceedingly rare for a Senator or Representative in Congress to make the claim that his confidence was betrayed or that he has been badly used by the reporters. Certainly they have, in most cases, proved themselves worthy of trust and there seems to be no sound reason for making their business calls upon the President a series of secret sessions that somehow always seem to be ridiculous. Are the reporters such weighty men, such tremendously clever fellows that the President must rely upon them for their advice? Are they such intellectual giants that he must tell them, in secret, his plans and feelings?

They go to the conferences, wait listlessly until they are over, yawn, put on their overcoats and go away, muttering some unintelligible comment on the conference system which probably is better for being unintelligible. Nevertheless, when the next hour arrives for a White House conference they are on hand, hoping against hope, perhaps, that the Nation's Chief will say something and permit it to be used for publication.

A Dark Winter in England

By W. P. CROZIER

A FEW months ago the clouds seemed to be lifting a little in the English sky and there were hopes that the economic depression might be passing over. Trade runs in cycles and the present depression was approaching its fourth year; making all allowance for the enfeebled markets of Central and Eastern Europe, it seemed as though we were at last on the highway to recovery. But the clouds have descended more heavily than ever. From all the staple industries of the country comes the cry of trouble. The increase in unemployment which is usual in the winter months has set in six weeks before its time. There are a million and a quarter of registered unemployed, and their number may reach two million before the year is out. There are countless more who are unregistered or only partially employed.

The talk is now all of relief works and the schemes of government or of municipal bodies to mitigate the inevitable distress. More than 600 schemes for public works, involving an expenditure of £20,000,000, have been laid before the government by local authorities up and down the country, but even if it is possible to put them into full operation—and almost certainly it will not be possible—they will only touch the fringe of the problem, relieving but two or three hundred thousand out of a total of between one and a half to two millions. The skilled workman will benefit scarcely at all; relief works as a rule are for the laborer only.

The extreme depression has naturally given rise to a renewed demand from various industries for protection by tariff. The woolen trade demands it and so do the silk manufacturers, who are at this moment complaining bitterly that the United States by means of a tariff built up a great silk industry and that Macclesfield even sent skilled workers out to help in the building up. The loudest appeal of all is that made by the farmers through their organization, the National Farmers' Union. It is admitted on every hand that British agriculture is in a very bad way. As soon as fixed prices and state subsidies were abolished, agriculture in England ceased to pay its way—at least, if it paid its way, it was only because the wages of the unfortunate laborers were reduced to as low a level as that at which they stood before the war, when in many of our counties they were a disgrace to any civilized country. The wages of agricultural laborers, often men with large families, frequently ranged between four and six dollars a week.

The farmers now say that unless the state gives them some kind of assistance, three things will inevitably happen:

They will have to reduce the wages of their laborers still further.

They will convert a large part of the arable land of the country into grazing land for stock.

As a consequence, a considerable proportion of their laborers will be dispensed with altogether and will swell the army of the unemployed.

Even as it is, the amount of land under cereal crops is rapidly diminishing. Last year the wheat lands diminished by 226,000 acres and arable land as a whole by 400,000. All the pretty schemes of war time for increasing our self-sufficiency in food supplies have vanished like smoke; England is now more dependent on sea-borne supplies than she has ever been and the dependence grows apace.

Beyond doubt, therefore, there is an immense amount of want and misery to be faced during the coming winter. Such efforts as are made will only be palliatives. They will be of various kinds. There is, in the first place, the Unemployment Insurance fund, which will go steadily disbursing to all those who have been in work long enough or sufficiently recently to be entitled to its benefits. Last year the revenue of this fund amounted to £49,000,000. The employers contributed £19,000,000, the work people £17,000,000 and the state £13,000,000. Then there are the government relief schemes. It is intended to push on with all kinds of large government enterprises, like afforestation, the development of roads, the laying of trunk telephone cables and the like. More important is the assistance given to the municipalities which everywhere are putting in hand their own local schemes for roads, electrification and so forth. It is to be noticed, of course, that all such schemes have to be paid for out of someone's pocket and that for the most part they do nothing for the highly skilled artisan (as in the cotton industry) who is not fitted to be, and will not consent to become, a general laborer.

The Labor party has proposed an elaborate program. It is this:

(1) Organization of government and local authorities' contracts in anticipation of needs for the next three years.

(2) Prohibition or limitation of overtime.

(3) Restoration and development of roads, waterways, canals and railways.

(4) Putting in hand of national schemes for bulk electric supply.

(5) Building of schools.

(6) Afforestation.

(7.) Increase of land cultivation, provision of small holdings and allotments.

(8) Harbor improvement and land reclamation.

(9) Housing.

(10) Training schemes for the unemployed, educational facilities for unemployed "juveniles" and the stoppage of the influx of juveniles into the labor market by raising the school-leaving age.

Milwaukee's Christmas Tree is made of 400 trees stuck into a telephone pole 75 feet high. With the star, the tree stands 84 feet high. At the right a night photograph is shown, and below, the Milwaukee Police Band.

Milwaukee's Christmas Tree—Four Hundred in One

Business Men Contribute for Annual Holiday Observance

MILWAUKEE is no longer a predominantly German city, but the spirit of the old Germans who gave the city its character is still strong upon the municipal life; especially at Christmas time.

Due to advertising, the city of Milwaukee has been given a fleeting fame for many things, but one very legitimate element of fame has been overlooked—the Milwaukee Christmas Tree. Perhaps you have not associated Milwaukee with Christmas festivals, but if you are ever there on Christmas Eve, go up to the Court of Honor which stretches from Ninth to Eleventh streets on Grand avenue—be there promptly at 5:30—and a marvelous spectacle will greet your eyes.

First you will see the Christmas Tree, which is made of 400 Christmas Trees, standing seventy-five feet high, and topped by an eight-foot electric star. You will see the mayor, who is a Socialist, and his wife, who is a Catholic, and Rev. S. Paterson Todd, Protestant minister and secretary of the Wisconsin Lord's Day Alliance (think of that—a reformer!) standing side by side, waiting for the moment. Mr. Todd is there, having been chosen by a committee comprising all the churches, Catholic and Protestant, of Milwaukee.

At the stroke of the half hour after five, Mayor Hoan will turn the switch that lights the glorious star. The chimes of a near-by church will break upon the evening air in the old Christmas hymn, "Adestes Fidelis." Another pause and the Tree is flooded by varicolored light, and the Police Band, leading a massed chorus of five hundred singers, and they in turn leading thousands upon thousands of spectators, begin the program of Christmas hymns—"O Come, All Ye Faithful," "Holy Night, Silent Night," and "Onward Christian Soldiers."

A brief pause ensues, and silence; the tree towers and glows above the throng. Then a blare of trumpets and "On Wisconsin" is sung as only Wisconsin can sing it.

This is the way the people of Milwaukee say "Merry Christmas" to one another at the Court of Honor. The program does not vary from year to year, and it is carefully timed to consume but one half an hour.

The tree is one of the wonders of the occasion. Every year a carload of 400 average-sized Christmas trees are brought to Milwaukee. And every year the telephone company gets out of storage a telephone pole seventy-five feet long, studded its entire length with sockets for trees. The pole is sunk into a cement socket six feet deep and two feet in diameter. Into 400 sockets arranged at intervals the length of the pole, the 400 Christmas trees are placed, so that each tree becomes only a branch of the larger tree thus made.

It is a real Municipal Christmas Tree in that it is in charge of a commission appointed by the mayor, although the money for the cost is contributed by the business men. The simple announcement that the time has come to prepare for the tree is sufficient to bring in the necessary funds. Last year $1,144 was contributed and $919.42 spent. Everything is done at cost, except the Police Band who volunteer their services. There is a little story attached to that. The church people of Wisconsin became interested enough in the Police of the state to fight for a state law giving them time off, like any other class of workers, and the Police Band takes the Christmas Season to show that the Police remember it.

In previous years the shut-ins, invalids and aged of the city were taken in automobiles to the Court of Honor to hear the program, but because of the weather at Christmas time an improvement in that arrangement is to be made this year. These guests are to be brought to the place in automobiles as before, but instead of sitting through the program in the open air they are to hear it by radio in the Grand Avenue Methodist Church near by. Station WCAY will broadcast the whole program. Last year it was heard in San Francisco and New York.

Milwaukee people are proud of their Municipal Christmas Tree, which, by the way, is only one development of their communal celebration of various holidays.

Sumner Tells of Fight to End Stage Depravity

Superintendent of Society for Suppression of Vice Outlines Campaign

By CHARLES ALBERT COLLMAN

"THE audience leaving the theater after seeing a recent New York production expressed itself audibly.

"'It was filthy,' was said. 'That goes beyond the limit,' was another criticism. From a girl in her teens was heard, 'Did you know this was the sort of play it is when you asked me to see it?' There was indignation and resentment in her voice.

"How many others were indulging in the same sort of criticism can only be conjectured. There were all the signs of danger there, however. The menace was there. That sort of feeling developed toward the theater will sooner or later mean censorship."

The foregoing lines, written by Karl Decker in the *Morning Telegraph,* may easily be applied to at least a dozen plays witnessed by crowded audiences in New York City at the present time. Reviewers comment on the nature of these performances, but, editorially, the newspapers, owing to intimate business relations with powerful theatrical interests, are discreetly silent. It is impossible to arouse public sentiment in the metropolis, owing to the existence of a large exotic element that feasts delightedly upon such "shows." But a storm may break loose when these "successful New York productions" are sent out upon the road.

The man probably most intimate with the nature of these plays, and the methods used to advertise their indecencies, is John S. Sumner, superintendent of the New York Society for the Suppression of Vice. I give his own words as he related to me, in the offices of the society in West Twenty-second street, his efforts to put an end to vicious theatrical productions in New York.

"If the newspapers would stop pussyfooting," said Mr. Sumner, "and would come out with one blast against such-and-such a manager who is producing a 'rotten' show, there would be immediate results. Police action is not effective in suppressing objectionable plays. This was shown in the 'God of Vengeance' case where the producers and actors were indicted, while the play ran on for six months, without interruption, to filled houses, from the advertising it was getting. The persons responsible were convicted, one or two were fined $200 and the others got suspended sentences. So you can see that criminal prosecutions, even where they result in convictions, are not effective in dealing with the situation.

Jews End Fling at Faith

"IT IS about a year ago that the play entitled 'The God of Vengeance' was produced in this city. It was an obscene performance, having to do with a brothel keeper and the activities of public prostitutes. Into this atmosphere was introduced a 'sacred scroll,' relating to the Jewish religion.

"Prompt and indignant action was taken by certain Jews, including Rabbi Silverman, and the result was the criminal prosecution of producer and actors and their conviction on the charge of presenting an indecent show tending to corrupt the morals of youths and others.

"Today there is being enacted on the stage of the Fulton Theater a play entitled 'The Cup.' Of it, the *Evening World* of November 15, said: 'The story concerns the theft of the holy cup supposed to have been used by the Savior. In the telling there is a murder, an ever-recurring flow of degrading language and the elevating spectacle of a gangster beating up his woman.' The writer calls it 'a maudlin, gruesome mess of garbage.'

During the current year a man was convicted of an offense for showing an oil painting representing Christ in all His dignity, but in association in an offensive manner with present-day prohibition activities.

"Are the Christian people of this city dead to any sense of the sanctity of those things fundamental to their religion? Is the use, in dirty stage commerce, of the Holy Grail, the symbol of the Holy Communion, in association with foul and indecent language and persons, of no moment to the followers of Christ? By their apathy toward such outrages they are powerfully assisting the vultures of the stage in creating a contempt for things sacred.

"My relations with the Commissioner of Licenses (Mr. Glatzmayer) and his recent public utterances, as quoted in the press, lead me to believe that he has no sincere desire either directly or through the Citizens' Jury Plan, which was put, ready-made, at his disposal, to take action to improve public show conditions.

"Police timidity in such matters and the possibility of long-extended, dilatory proceedings in criminal actions, render any aid from that quarter ineffective.

"The question is therefore put squarely up to all the people of the state who believe in the maintenance of common decency to rally to the support of a movement to place the stage under effective official control through legislation.

"The writer in the *World*, above quoted, very truly refers to the present as 'this highly profane and richly vulgar season.' None has been worse in this respect. And the evil will increase just as long as the public is apathetic to the activities of the peddlers of filth and the laches of their paid servants.

"Is there such a thing as decent public opinion or have we sunk to the depths of selfishness and irresponsibility to our own generation and those to come?"

It may be noted that while the *World* permits its reviewer to condemn the quality of a performance, its advertising pages commend Shubert and other productions in language such as the following:

YOU MUST SEE	In the most daring performance ever staged in New York.
An Erring Wife	
A Woman of the Streets	IF YOU WANT TO GASP
A Neglecting Husband	IF YOU LIKE SPICE IF YOU ARE FEARLESS
A Deceiver of Women	IF YOU CARE FOR DARING PLAYS

Aside from "The Cup," there are five other objectionable plays whose performance Mr. Sumner has tried to have expurgated or removed from the boards. He has asked me not to name these plays, however, so that the producers may not take advantage of the publicity thus afforded, as was done in the instance of the "God of Vengeance." It may be sufficient to state that two of these productions, of the "review" type, are objected to because of displays of nudity, one of them, in addition, presenting a highly obscene burlesque; while the other three are conspicuous by reason of the foul language employed, and their obscenities.

JOHN S. SUMNER.

"Early in the season," continued Mr. Sumner, "I wrote to August W. Glatzmayer, Commissioner of Licenses, calling his attention to the performance that included a 'red light' burlesque of a repulsive character. Nothing happened. For the second time I brought to his notice the burlesque and the oriental dances, which would not have been allowed in Fourteenth street or Coney Island. This time I received a call from his deputy, Joseph O. McShane, of the Division of Inspection, who said he had got a complaint about this show through the mayor's office, and that he had made a report calling attention to the display of nudity. Mr. Glatzmayer later went to see the performance and expressed the opinion that it was 'rotten burlesque.'

"Augustus Thomas, head of the Producing Managers' Association, then called me up and told me that the Shuberts had eliminated the features I had objected to in the burlesque. I found out that they hadn't done anything of the sort. Mr. Glatzmayer, however, said he would take up the matter with Mr. Thomas, recommending the adoption of the Citizens' Jury scheme, which we had devised in 1921, and the nature of which I will explain afterward. Still nothing was done.

Enright Decides to Act

"FINALLY I wrote another letter to the commissioner, including the other four objectionable performances in my complaint. He then asked me to arrange a conference with Mr. Thomas and Frank Gillmore, of the Actors' Equity Association. I suggested that we include Owen Davis, who was president of the American Dramatists. So then we had a conference in Mr. Thomas' office. The upshot of it was that the three theatrical representatives reaffirmed their belief in the jury scheme and stated that it had been re-indorsed by their various organizations. But they stated that they didn't think the jury plan should be applied in any cases unless upon the receipt of written complaints, with the signatures, names and addresses of citizens who had seen the shows, and in sufficient numbers to warrant the commissioner in taking action. They indicated to him further that they didn't wish it applied except as a last resort.

"I explained that this society of ours had been in existence fifty years, and that, through long experience, we well knew that the ordinary citizen would not send in a signed complaint, because he feared becoming involved in some legal action, and dreaded ridicule by the newspapers. I asked why the commissioner should not call in the aid of the police. But they could not see it that way.

"The commissioner decided that he would take action only on 'legitimate signed complaints,' and not on anonymous or verbal ones. He then added that he had been to see the show with his wife, and had seen nothing objectionable. The sole complaint, he maintained, had come from Mr. Sumner. I called his attention to the complaint that had been received by his deputy, but he reasoned that that one had been anonymous.

"As a result of the conference, however, Police Commissioner Enright appeared to think that it was up to him to get busy on the matter. He appointed a committee consisting of First Deputy Commissioner John A. Leach, Mrs. Hamilton, a police woman, and Charles G. Young, his own secretary, to investigate the complaints, and report anything actionable to Chief City Magistrate McAdoo. Meantime Magistrate McAdoo expressed the opinion that there would be no use in attempting the prosecution of objectionable theatrical performances except by way of the grand jury, and with what he called 'disinterested witnesses'—not men identified with law-enforcing agencies, or persons engaged in investigating and attempting to better social conditions. Such was the inconclusive end of all our efforts, following the conference with theatrical representatives, and with police and judicial officers—a virtual deadlock, signifying that nothing could be done.

"Now to return to the Citizens' Jury system, which, tentatively, had been endorsed. The jury idea was the result of the action we took in 1919, when Broadway was entertained by a succession of disgraceful 'bedroom' farces. Complaints had been made to various public officers, the District Attorney's office and the police, but nothing was done to check the objectionable and demoralizing performances. So I figured that a group of public organizations might be able to do something by co-operation We managed to get together twenty-four or twenty-five different organizations, some national and some local, such as social welfare societies, the Y. M. C. A., the Y. W. C. A., the Boy Scouts, the Catholic Theater movement and the Catholic Charity Organization.

"We had three objects in view. One was to co-operate with public officials; next, to co-operate with the theatrical people; finally, we were to engage in criminal prosecutions, if they were found necessary. We arranged a conference in 1920 with the Producing Managers' Association, and, at the meeting that followed, the discussion was conducted on pleasant and courteous lines, but, as usual, nothing resulted.

State Organization Likely

"TWELVE to fifteen conferences were attended by representatives of The Better Public Shows Movement (the organization we had formed); the American Dramatists, the Producing Managers' Association, the House Managers' Association, the Drama League and the Actors' Equity Association. The result was the Citizens' Jury Plan. A panel of about 300 citizens was selected, composed of persons who had no financial interest in the theater, and no active interest in any so-called reform organizations. They were just 'good citizens,' if persons who are trying to clean up objectionable plays cannot be classed in that category.

"That panel was filed with the Commissioner of Licenses, and the agreement was that if he received complaints concerning any theatrical performance, he was to select a jury of twelve from the panel in the presence of representatives of the theater and our organization, The Better Public Shows Movement. The jury was to see the play, and was to decide in one of three ways: the show was to go off the stage, it was to be altered, or it was to continue. Nine out of twelve jurors were to reach an agreement as to what was to be done.

"All the theatrical interests agreed to abide by the decision which was reached by the jury. The presumption was that we had found a constructive and effective plan that would dispense with police or other official interference. This plan has recently been reaffirmed by the theater interest, but now the License Commissioner refrains from putting it into effect, through the imposition of the impossible conditions as previously described, relating to signed complaints by citizens.

"In view of the present situation, we can rely only upon the appointment of some legislative commission, which will either issue a license to everybody who produces a play, with a revocable clause, the renewal dependent upon his good behavior; or else will establish an actual censor who must be satisfied with the nature of the play before it can be produced. The commission would consider complaints and the book of the play, and hear witnesses. The commission would not be local, but would be a state organization, like the Motion Picture Commission, which is imperfect, but has had a remarkably good effect.

"The Methodist National Welfare Organization in Washington is interesting itself in this subject, and I understand that every Methodist minister is to get a blast. But here in New York City our hands are tied. It is useless for us to go to a magistrate's court with a complaint. The attitude of the chief city magistrate is that no professional witnesses are favored. Under such restrictions it is almost useless to advertise some offensive show with an ineffective proceeding. So all that we can do is to rouse the people of the state and get public sentiment prepared, leaving that to deal with the situation."

Mr. Ford's Page

GOVERNMENT is in the same position as every other service agency these days in that the demands made upon it grow more numerous and more burdensome. One has only to read a modern President's message to Congress to see what a multitude of matters are left to the action of government. In other days a President's message was largely a statement of principles, often a patriotic document setting forth the hopes and purposes of the United States; today it more resembles a schedule of jobs to be performed.

This increase cannot be attributed to the growth of the country alone. Increase in population would have required merely an expansion of the services already being rendered. It would mean a larger number of post offices, for example, more government employes, a greater volume of business, but it would mean practically the same administration. The increase must be accounted for by other causes.

First among these causes is the fact that the government has rendered service in the past. If that statement had to be argued, the point could be settled by saying that no agency is asked to give more service unless it has already rendered appreciable service. That is so in everything. It is the institution which has already done something that is asked to do more. It is the man who has well carried his responsibility who is asked to carry more. And upon this principle we must account, in part at least, for the increase of service demands made upon the Government.

Then the second cause is the constancy with which it has been preached and taught that the government is the servant of the people. And servants are made to work, to carry the burden—that was the conclusion. If you wanted anything done, there was your servant, the Government.

This point of view has, however, undergone some interesting changes. When people said "the government," they discovered that it was hard to define what they meant by the term. As more and more thousands of American citizens journeyed to Washington for the purpose of finding the government, and came home baffled in their quest, the theory began to take on a different form. Instead of "the government" being the servant of the people, it became popular to say that "a public official is a public servant." And then the people began the job of getting service out of public officials. It was not always public service that they wanted either, for many of the demands made in the name of "public service" are really for private services which someone wishes the government to render for private interests. We know enough of this kind of service; a great deal of it has been rendered, at a very heavy cost, and much of it has been against the public interest. For it must be agreed that whatever is against the public interest is not public service.

But it was in this manner that the demands upon the government became standardized in their form and began to grow into mountains. People soon learned from powerful private interests that public servants were serviceable mostly to those who could bring the most pressure to bear upon them. Thus to the corporation lobby was added every other kind of lobby, many of them organized for what they thought were the most laudable purposes but all of them trying to get by private pressure something which they preferred to call "public service."

And so it has gone on, until there is nothing the government is not asked to do, until there are few things the government refuses to do—although the fact is that though many things are promised, and many demands granted, the government is doing very few more governmental services than it has always done.

> *A PEOPLE that begins by surrendering its duties to a government, ends by being compelled to surrender its rights. The American nation has kept its rights by attending to its duties. But the fashion seems to change. Observe the schedule of work put up to Congress and see whether it means that old-fashioned self-government is going out. Observe also whether much of the so-called public service is not only so much private proposal publicly endowed. It is a bad habit to run to Washington for everything, just as it will be a bad condition if ever Washington comes to run everything. If the present tendency continues, the natural result will be that Federal control will engulf our entire life and we shall all be working for the government.*

What is done mostly nowadays is not public service in the sense of the constituted government itself actually performing the service. What is done is this: a company of ladies or gentlemen, not having enough to do to keep them busy, conceive the idea of uplifting the people by the introduction of some delightful scheme; and so they besiege Congress in behalf of that scheme; and presently Congress gives orders on the public treasury for sufficient funds to create offices for the more vociferous of the uplifters, and in this way another department is created which functions mostly through the mails and adds to the assorted burden of daily advice sent forth from the Capitol of the nation.

So that much of public service, so-called, has come to mean securing from Congress the public endowment of private proposals. The only really public or governmental part in it is the issuing of permits to draw on the public funds.

Now, a government can perform only governmental duties. And until government restricts itself to its own duties, the things it will be asked to do are going to increase to such extent as to threaten to engulf the whole of the people's life, and the end of that will be that we shall all be working for a government. When that time comes, the American nation will be a thing of the past.

It is not the work of government to supplant private initiative nor to render unnecessary private responsibility; it is not the work of government to be in the stead of the people, nor to treat the people as its children. It is the work of government to keep clear the road of private initiative, to keep fair the conditions of responsibility; it is the work of government to translate the will of the people for equality of opportunity and to regard the nation—the nation itself—as the greatest achievement. A nation is more than a government, more than a body of laws, more than a host of departments that herd the people like sheep.

A nation cannot grow great without assuming responsibility for its own life. If it becomes the habit to run to the city hall or the national capitol for everything we want, the result of that habit will be a state of helpless dependence, and the result of that dependence will be the rule of a tyrant. That is always the story of people who fall into the delusion that the government is bigger and better than they, to which they resign all their duties.

The people who begin by resigning all their duties to a government, end by being compelled to resign all their rights.

Must we go on federalizing our life? Is there not some safeguard to America in the fact that the district school board functions in its own district, and that the village court dispenses justice, and that the township government regulates local affairs? Must we dispense with the district school board in favor of a county organization, and then dispense with that in favor of a state organization, and then eventually federalize education altogether? If we do, it is not the American way. Self-government is of the essence of our Constitutional life, and the taking of government out of the hands of the people, the federalizing of all the people's rights and duties is not self-government.

The burden at Washington would not be nearly so heavy, the cost of government would not be nearly so great, the opportunities of private privilege at public expense would dwindle in number, if the duties of government were distributed and if the people were taught to look after their own affairs instead of being coddled by officialdom.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Message

THE President's Message has been received as at least his own and is therefore respected. Its reception, however, was rather curious. At first there was a feeling in his own party that, being only a President's Message, it could be judicially handled or manhandled, as the case might require, just as party platforms are. There was a feeling in the opposite party that here was too much conservatism in the wrong things and too much progressivism in the wrong things. Both attitudes have undergone a change. There was a straightness and clarity about the President's utterances which have given it, in its afterglow, the tone of command. Republicans will regard it as the Order of the Session, and so will Democrats, and if political issues arise from it for contest in the next campaign they will arise out of Congressional performance rather than out of Presidential utterance.

It is to be hoped that one of the first points to be taken up by Congress will be the abolition of red tape in giving care to ex-service men in need of care. Congress can afford to do this, do it at once, and do it handsomely. There have been so much cruelty and scandal under the old red tape system which only kept the Government and the ex-service men apart, that the country will readily stand for sufficient generosity to repair the injury done.

There may seem to be bigger political questions than that in the President's Message, but that is the one human thing that ought to be done NOW.

And as to federalizing American education, Congress will hear both things from both sides on that. It may well be one of the matters left over.

Is Party Government Going?

THE recent election in Great Britain turned out to be a referendum rather than a determination of the party which should rule the Empire. The Conservative party lost its control of Parliament. But neither Liberals nor Laborites were able to obtain a majority. The election was merely the defeat of the proposal for a protective tariff, sponsored by Premier Baldwin.

In theory, the British Government is party government. In fact, the present situation is the opposite of party government. No party is equipped with a majority. Coalition government of parties possessing fundamental differences cannot be of long duration. With the capital levy, neither Conservatives nor Liberals are in accord; therefore a Conservative-Labor or Liberal-Labor coalition would not be looked upon with confidence. There are differences between Conservatives and Liberals which make difficult their agreement except in a crisis affecting the Empire.

The situation in Great Britain does not differ widely from that in the United States, as disclosed by the events connected with the organization of Congress. In theory, the Republicans hold a majority in both Houses; the handful of Farmer-Labor Senators and Independent and Socialist representatives could not in numbers prevent the organization of both Houses as Republican agencies.

In fact, it developed that the Republican party organization was able to control neither House. An insurgent group in the House prevented the reelection of Speaker Gillett until terms which it had dictated were agreed by the organization leaders. In the Senate, party control by the Republicans appears even less secure. The non-organization group was able to dictate committee appointments to a large extent and on the first test vote over the election of a President pro tem demonstrated that it possessed the balance of power.

Great Britain and the United States have tried party governments. Now it appears that both are trying another kind of government. Old party leaders see the possibility of deadlocked legislation.

The Nation's Roads

STEADY progress in the nation's highway program is reported by Henry C. Wallace, Secretary of Agriculture, in his annual record of department achievements.

The completed projects at the end of the fiscal year totaled 26,536 miles, of which one-third was added to the record during the previous twelve months. At the beginning of the present fiscal year, the road-building projects under construction amounted to 14,772 miles.

The total mileage of roads in the country at the time of the passage of the Federal Highway Act was 2,859,575 miles. The entire system covered by the enactment cannot exceed 200,170 miles, and Secretary Wallace figures that the system when finally designated and approved will probably not exceed 179,000 miles.

The amount which these good roads will add to the wealth of the country is incalculable. It will vastly exceed their cost. Approved systems in thirty-five states pass directly through 1,049 out of the 1,111 cities having a population of more than 5,000. When the Federal system is joined with the roads constructed by the states and counties, the remaining cities of this class will be connected by a vast chain of interstate roads. It will be possible for a person to travel on improved roads to within a few miles of any destination in the United States. Ninety per cent of the entire population of the country will live within ten miles of an improved highway. In some states, the percentage will be close to 100.

Controversy has not entered into the wisdom of improving the nation's highways. Partisanship has never divided Congress on the appropriations for that purpose. President Coolidge in his annual message declared that expenditure of public moneys for highway purposes added more than anything else to the nation's wealth. The time seems to be approaching fast, when all the residents of the land will share equally in this great national wealth, a wealth which all may use but none may withhold from his fellows.

Children in United States Courts

IN GOVERNMENTAL processes, delay is sometimes excusable, sometimes it is desirable. When there is controversy over the merit of legislation proposed, a delay in the enactment of that legislation, until its wisdom is clearly shown, is obviously advisable.

One of the recommendations of James J. Davis, Secretary of Labor, in his annual report to Congress, directs attention to a delay that is inexcusable.

Secretary Davis repeats a recommendation he made last year that steps be taken to make clear the distinction between delinquent children and adult offenders in Federal courts. The principles governing juvenile courts have been accepted by nearly all the states. But the United States still invokes the principles of middle-age justice. Except in the District of Columbia, United States courts proceed against little children by the ordinary methods of arrest, detention in jail with adults, indictment by the grand jury, and subsequent discharge or conviction followed by fine or imprisonment.

Under our present statutes, if a child of eight or ten, playing around a freight car, should break the seal, enter and carry away a toy, it would be necessary to invoke the ponderous machinery of Federal grand jury and court. The United States judges, against their will, perhaps, would be compelled to view the proceedings as dealing with a willful breaker of the law rather than with a mischievous child.

The remedy lies within the power of Congress. Secretary Davis recommended reform last year. There can be no excuse if Congress again neglects its plain and comparatively simple duty.

Coolidge on the Alien Flood

THE proposal put forward by Representative John F. Carew, of New York City, to increase the size of the House Immigration Committee from the present fifteen to twenty-one, has aroused the intense opposition of Representative Albert Johnson, chairman of that committee. The committee of fifteen is unwieldy as it is and represents so many conflicting opinions that agreement on the fundamentals of sensible, lasting legislation has been impossible. The three per cent bill now in force was extended because of lack of agreement on anything else. The Senate Immigration Committee has operated with difficulty for the same reason, although it contains but eleven members, seven Republicans and four Democrats.

Representative Carew's plan to enlarge the committee would give the large cities of the country a greater representation in the committee membership. This would serve to liberalize the immigration laws and admit more immigrants of the type now found in the crowded cities. According to a survey recently completed, New York City has in its population 2,000,000 foreign-born, 2,300,000 native-born of foreign-born parents, and 1,500,000 native-born of native parents. Seventy-five and five-tenths per cent of the foreign-born residents of the United States are in cities of more than 2,500 population. In Chicago, 29.8 of that city's population is foreign-born; in Boston, 31.9 per cent; in Cleveland, 30.1 per cent. Of our 14,000,000 foreign-born today fully 3,000,000 cannot speak the English language and another 3,000,000 cannot read it. Nearly one-half of our total foreign-born population are classified as of inferior or very inferior intelligence. Why stack the committee with racial group Representatives who would try to admit more immigrants of this type?

President Coolidge, in his recent message to Congress said:

> *"American institutions rest solely on good citizenship. They were created by people who had a background of self-government. New arrivals should be limited to our capacity to absorb them into the ranks of good citizenship. America must be kept American. For this purpose, it is necessary to continue a policy of restricted immigration. . . . . I am convinced that our present economic and social conditions warrant a limitation of those to be admitted. We should find additional safety in a law requiring the immediate registration of all aliens.*
>
> *"Those who do not want to be partakers of the American spirit ought not to settle in America."*

The present chairman of the House Committee believes in admitting even fewer immigrants than now come in. Most of the present fifteen members are also restrictionists. As it stood in the last Congress his committee contained only two members from large cities, Isaac Siegel, of New York City, and Adolph J. Sabath, of Chicago. Mr. Sabath is a member of the present Congress but Mr. Siegel is not. On the eve of a national election wherein the foreign vote may figure importantly, Congress may sanction any let-down in the immigration law which the committee sees fit to approve. The fact that the taxpayers of America in the various states are paying 7.63 per cent of their total tax bills to maintain institutions to care for the socially inadequate of foreign stock, should cause those taxpayers to oppose any attempt to admit a greater number of such immigrants.

Lord Birkenhead Again

THE good ladies of the W. C. T. U.—was it at Council Bluffs?—who thought that Lord Birkenhead had used his pocket flask in the basement of a Methodist church there, and who consequently harried him across the country till he begged the Press to let him off, may be content now. Lord Birkenhead has been properly cared for at home. He was made Rector of the ancient University of Glasgow and gave as his Rectorial Address an old speech which he had been delivering in America, a speech, by the way, which was in condemnation of idealism. Now, it happens that a speech which said some true things about idealism as America sees it and which was applied to Wilsonian idealism in particular, is not equally true and attractive when pronounced in another scene where another sort of idealism obtains. And the result was that England and Scotland and Wales, with Ireland not yet heard from, gave Lord Birkenhead the soundest trouncing any British figure has received in the last quarter century. They call it over there "a bad Press"; it was really a fearfully bad Press; a fatal one; and it may rejoice the ladies of the W. C. T. U. of Council Bluffs to hear of it.

Newark Port Development Cuts New York Jam

War Emergency Brought Out Value of Harbor and Docking Facilities Lying Along Jersey Shore to Modify Congestion

By JOHN DAVIS ANDERSON

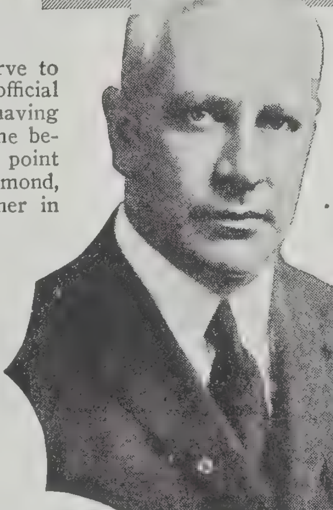
ALEXANDER HAMILTON declared that within a century the greatest city in North America—the greatest in population and commerce—was to be, not on the Island of Manhattan, but on the westerly banks of the Hudson River and in the territory touched by the Hackensack, Passaic and Raritan rivers; on the numerous bays and inlets close to the Atlantic Ocean.

By degrees, but requiring much more than one hundred years, this prophecy seems certain to be fulfilled. The population of Northeastern New Jersey; of Hudson, Essex, Union, Bergen, Passaic and Middlesex counties has increased so rapidly in twenty-five years that the larger cities of Newark, Paterson, Jersey City, the Oranges, Elizabeth and the Amboys practically form one great center.

There have been natural handicaps to the development of shipping along the New Jersey waterfront and up her rivers. These are all sluggish streams and often with no great depth of channel. The result has been that the Hudson, a wider, deeper stream, together with the eastern end of Long Island and the East River, formed the basis for the great New York Harbor. However, the time came when shipping to and from these points became so congested that wider shipping zones were sought. That which nature did not provide in sufficient quantity has had to be supplied by the work and craft of man. One of these developments—the principal one—has been at Port Newark. This is on Newark Bay about three miles to the southeast of the city and directly across the Upper Bay and opposite Bayonne. Its natural advantages are many.

Airplane view of points adjacent to Port Newark development.

Little if anything is to be found in the records of Newark which would serve to indicate that such is the fact. No city official before 1907 realized the possibilities of having a port here and it was only a short time before the World War that work at this point was pushed forward. Thomas L. Raymond, former mayor and now city commissioner in charge of public improvements, took the matter in hand but progress was slow, for the city's financial policy is a conservative one and it was no easy matter to get the money needed to proceed with the work.



THOMAS L. RAYMOND,

former mayor and now city commissioner of Newark, under whose direction Port Newark development has been carried forward.

When the war did come, Newark had done enough to benefit the Federal Government. About 245 acres of meadow land had been filled in, and on the shore of Newark Bay two broad roads from the southern part of the city were already built. The War Department took 133 acres of this land and constructed its gigantic army supply base. This consisted of a large group of hollow tile buildings and sheds—a $12,000,000 undertaking. From this terminal millions of dollars' worth of clothing and food was shipped to Europe during the war. This plant, containing 2,000,000 square feet of storage space, is now idle and the War Department is seeking to dispose of it to private commercial interests.

The advantages of the location of Port Newark to the shipping carried on from this point are unusual and intended to do away entirely with lighterage service. In New York Harbor this is impossible.

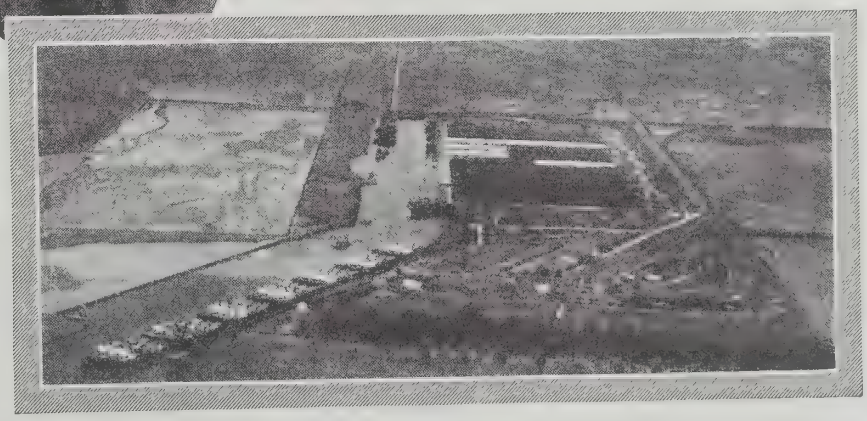
By dredging at first twenty feet deep and later redredging to thirty-one feet, along the inshore channel—the old Peddie Ditch—vessels of 12,000 tons, the size of the large freighters and "tramps," can be loaded directly from railroad trains. Within almost a stone's throw from Port Newark are the freight lines and classification yards of the Pennsylvania, Lehigh Valley, New Jersey Central, Philadelphia and Reading, and Baltimore and Ohio railroads and connecting roads.

After the war, a shipping corporation was organized at Port Newark and equipped with thirty-two 5,000-ton cargo carriers. For the most part these boats had been built at Port Newark when Germany seemed likely to win the war. For about three years this plant, which occupies 112 acres of land and some 4,000 feet of dock, has remained idle, but now a line between Newark and the Gulf of Mexico ports is in operation. There are twenty-two ships sailing to all ports along the Gulf and to the west coast of the United States, by way of the Panama Canal. This indicates some of the practical work accomplished by this improvement.

Work has been going steadily forward until, in addition to the dredging, the Port has 8,000 lineal feet of dock, traversed by standard gauge trackage, with 2,500,000 square feet of covered storage space and modern improved highways connecting with all points of the metropolitan area, and about 1,200 acres of waterfront land which has been filled in and is owned by the city of Newark. This is now available for development and is suitable for shipping, warehousing and manufacturing industries.

Port Newark is but a part of New York Harbor. Newark Bay forms a part of the westerly arm of this harbor and is only six miles from the open sea.

Newark has spent about $6,500,000 on this development, which has a very direct connection with another public undertaking—the Passaic Valley Sewer. Without this the city's work at the Port would have been futile. Ever since sewage has been piped, the towns and cities in Northern New Jersey where the flowage was toward the Passaic River have used this once beautiful stream as the outlet. For half a century or more it has been an open sewer. The growth of Paterson, Passaic, Newark, the Oranges and other municipalities so using it caused its picturesqueness soon to fade. Then came the work, because of urgent necessity, of constructing the sewer the length of the lower portion of this valley with the outlet into the ocean well out at sea. This has been done under the direction of the Passaic Valley Sewage Commission, formed by act of the New Jersey legislature. This sewer is now nearing completion. The original cost, estimated at $11,000,000, has mounted to almost $21,000,000. Work has consumed twelve years.



Airplane view of the Port Newark development.

Mr. Raymond has had other difficulties confront him. From time to time the War Department has sought to dispose of the army base buildings. For a time the city considered repurchasing the land and the buildings to retain control of the entire waterfront. But this plan was discarded to permit the War Department to negotiate directly with commercial interests, by which means it is expected the terminal will be more expeditiously developed.

Having co-operated to the extent of providing a deep-water channel, marginal docks and rail sidings for this terminal, this city is now engaged in providing similar improvements for the land area on the side opposite the warehouses. Director Raymond is convinced the final solution to the problem—the means by which Newark can develop a seaport of world importance—lies in the adoption of a broad, progressive policy of full co-operation with big business interests which are negotiating with him for the acquisition of waterfront area.

The city has borne the expense of dredging the governmental channel in the bay from the municipal docks to the deeper waters of New York Bay. This alone cost $1,250,000. Rightfully this should have been done at Federal expense, but the necessity for making progress was urgent. Congress has since recognized the value of the work and has appropriated $2,100,000 to widen the thirty-five-foot channel in Newark Bay.

Plans are under way to connect the Peddie Ditch, which still carries the sewage from the southerly section of Newark, with the Passaic Valley Sewer. With this accomplished the sanitary arrangements from Port Newark will be completed.

New York, the center of American commerce, is not only one harbor, but an association of harbors, and all protected from the sea. These interlocking bodies of water—the Hudson, the Brooklyn waterfront, New York Bay and the waters about Staten Island—all form a part of the greater harbor. Port Newark is the latest addition. But the fact most emphasized is that every trunk line railroad entering the port of New York can reach Port Newark without lighterage.

Our transportation problems are receiving more serious consideration. The mind naturally turns to the subject as it affects New York Harbor. A careful study proves that it is not possible to overcome difficulties without advantage being taken of the water-branches of the harbor. Its waterfront is 771 miles in extent. Of this total, 193 miles is New Jersey shore, for the port of New York properly embraces all the area from Sandy Hook to Tarrytown; from Port Washington to Summit. Here is a region of 1,500 square miles. An ocean-going vessel sails in and out of the harbor every twenty minutes. Almost one-half of the commerce of the country passes here. To this port more than 75,000,000 tons of freight come annually by railroad alone. To handle this 3,000 000 cars are needed—a string, if put in one train, long enough to circle the globe.

We may ask what has made New York the greatest port of our country. Boston led in the early days, and so at one time Philadelphia was the first port. The answer is that private enterprise backed by private capital has accomplished these things, aided, of course, by proper legislation, both state and Federal.

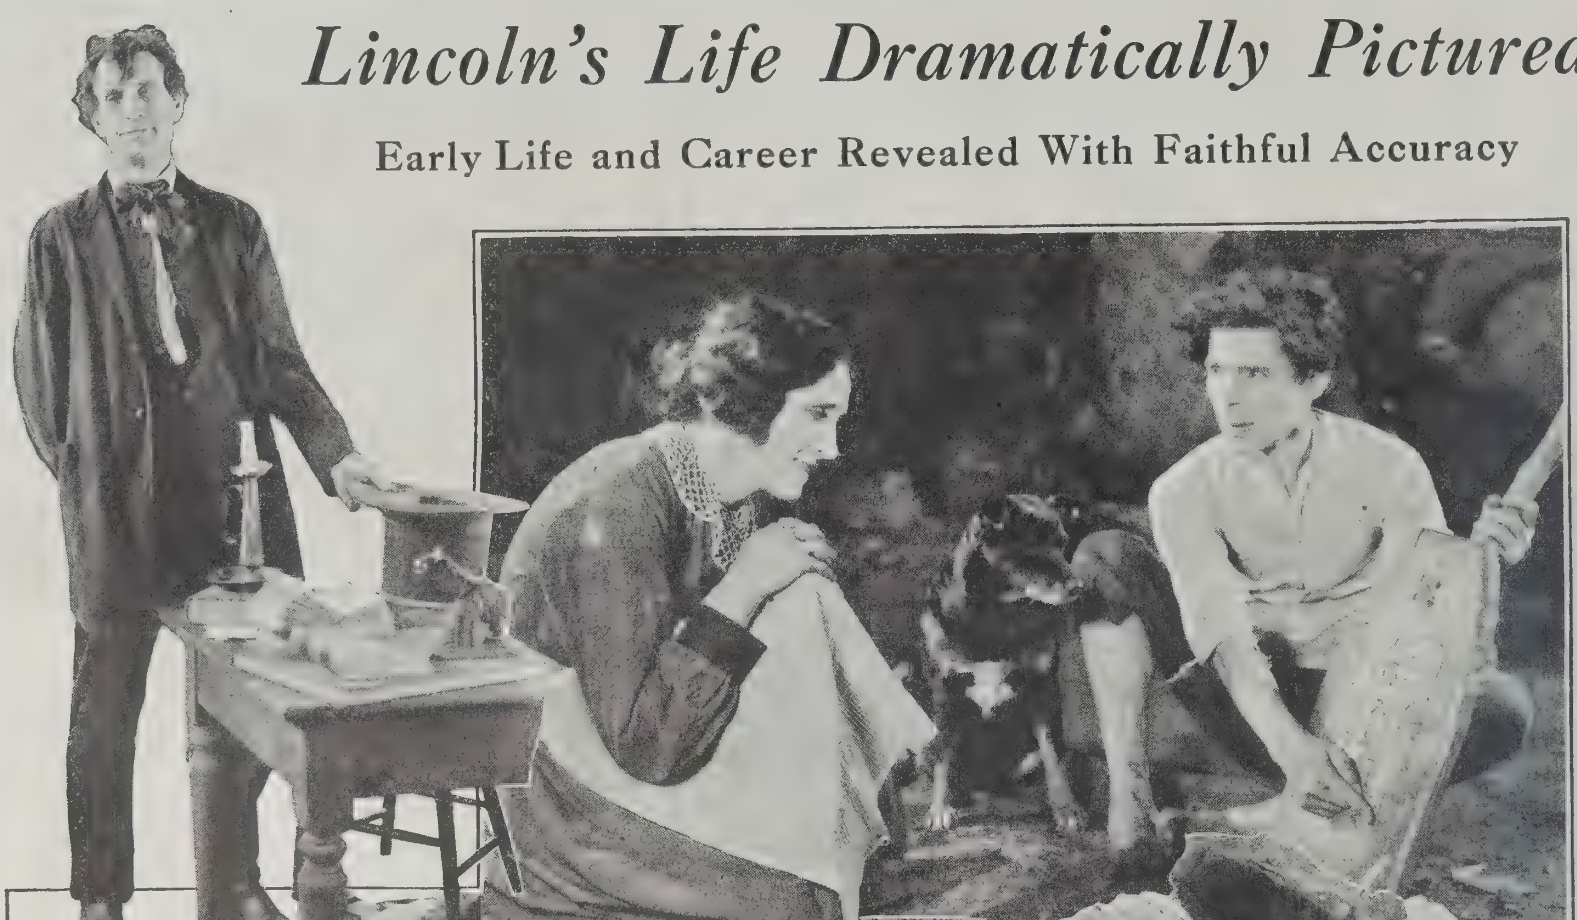
The nine New Jersey railroads carry ninety per cent of the 75,000,000 tons right up to New York's doorway. The great barrier has been the Hudson River. Three ways to overcome this barrier are presented: to go over or go under the river or to use the surface of its waters. There are no bridges across this section of the Hudson, and no room for freight yards on Manhattan, so the lighter is used after cars have been floated to pier-stations. These take shipments to and from steamers. It is the only present method of carrying on loading and unloading.

The development is almost entirely the work of Mr. Raymond without whose efforts it probably would not have come into existence.

Filled-in land of Port Newark development.

Lincoln's Life Dramatically Pictured

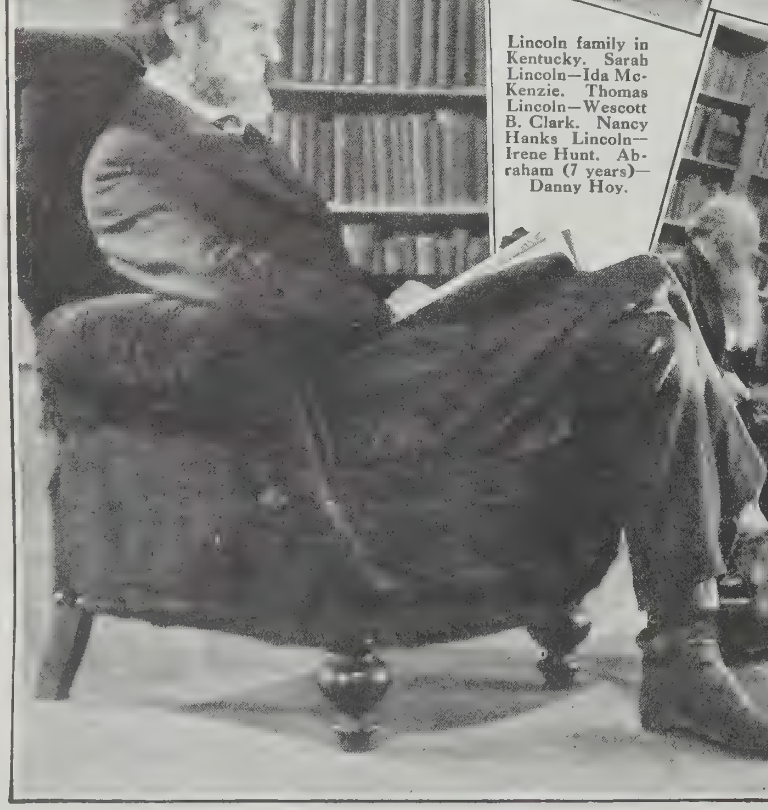
Early Life and Career Revealed With Faithful Accuracy



Left—Abraham Lincoln as a law student at Springfield, Illinois. Right—Young Lincoln, in old Kentucky home, uses the wooden fire shovel for a slate. Abraham Lincoln—Danny Hoy; Nancy Hanks Lincoln—Irene Hunt.

Lincoln family in Kentucky. Sarah Lincoln—Ida McKenzie. Thomas Lincoln—Wescott B. Clark. Nancy Hanks Lincoln—Irene Hunt. Abraham (7 years)—Danny Hoy.

Mary Todd has her first glimpse of Abraham Lincoln. Mary Todd—Nell Craig. Stephen A. Douglas—William Humphrey.



The overworked President had little time to devote to his beloved books. President Lincoln—Geo. A. Billings.

Abraham Lincoln in the Films

Dramatic Picture Soon to Be Released

A SPLENDID presentation of the life of Lincoln, giving the outstanding events of his career, is to be released by the Rockett-Lincoln Film Company, of Hollywood. Years of careful research were required to produce the authentic scenes, and interviews with those who knew Lincoln did much to add to the attractiveness and human interest of "The Dramatic Life of Abraham Lincoln." In the rude farm cabin in Kentucky, where Lincoln was born, and later in the Indiana and Illinois homes, his struggle for an education is strikingly portrayed. When he was nine years of age his mother died, and the daughter, two years older than Abraham, kept house for the sorrowing family. A little later his stepmother came into his life. Her advent greatly improved the family circumstances, for she proved to be of cheerful nature and encouraged the boy in his studies, which his father regarded as a form of idleness. With less than a year of school attendance Lincoln made the most of his limited opportunities and with the help of his stepmother he gained an education.

While working for a neighbor he took produce to New Orleans on a flatboat. Here he came into conscious contact with slavery, witnessing an auction sale of Negroes. This made a deep impression on the boy and he vowed that if ever the opportunity came to "hit" that system he would "hit it hard." When Lincoln was twenty-one, the family moved from Indiana to Illinois where Abraham helped break the prairie soil into farm land. He volunteered in the Black Hawk War and later became a candidate for the legislature. He failed in this first political venture and purchased a store, which venture also proved a failure. To business disaster was added the stern discipline of love and a lover's bereavement. He wooed and won Anne Rutledge, who shortly after the engagement died of a sudden illness. This so unmanned him that his friends feared for his sanity. Later he was admitted to the bar and entered politics in earnest. His debate with Stephen A. Douglas was a notable event of that period.

This portrayal of Lincoln in the films affords an opportunity for greater continuity of action than that permitted by Drinkwater's spoken drama, which necessarily was episodal. The part of Lincoln in later life is capably acted by George A. Billings and as a youth by Danny Hoy. Ruth Clifford as Anne Rutledge and Nell Craig as Mary Todd are most effective and the film contribution of Lincoln's career, to be released at an early date, bids fair to record a commendation not unlike that bestowed upon Emerson Hough's great epic, "The Covered Wagon."

Young Abraham Lincoln and his sweetheart, Anne Rutledge, went and had their picture taken. In the film it is done again, with a faithfulness that is refreshing.

At Christmas Time

By ARTHUR GLASBY WALKER

DICKENS himself said, "I have in my heart of hearts a favorite child, and his name is David Copperfield." The world-famous magazine, *St. Nicholas,* began its career in 1873, and among its Christmas stories was one called "The Enchanted Prince," contributed by Rebecca H. Davis. Her opening sentence showed she believed Dickens' experience was shared by a great many men of her own period—"At Christmas Time, when all men who are men turn into boys again."

However much Christmas may be loved by children, it is not loved by them nearly so intensely as it is loved by their parents. One powerful reason is that it gives them the chance to play, frankly and without shame, the fascinating game of childhood—the game of make-believe. The stage may have a new setting, and the players be not quite the same, but it is a chance to play out again a treasured memory picture.

So at Christmas, every good man likes to seek out his own "Tiny Tim." Only bachelors and such like are adults at Christmas.

Romance requires mystery. Romance is no more when everything is known. Whenever they keep Christmas earnestly, they keep secrets securely. A million secret purposes, hopes and expectations are hidden away behind these walls of smiles and laughter—we all know that it is so, and we wouldn't have it less so for all the world.

Now I like a full Christmas, the one I would like to replay around December 25, 1923. Imagine a Christmas when we have all become ascetics, and eat our dry bread and raisins in our own kitchenette, on the tenth floor at No. 10999! Good-fellowship without hospitality; romance without a generous table! It just is impossible, that is all. Interest, mystery, surprise, joy—that is Christmas. The one of which I am thinking seems to me now like three or four rolled into one.

A Missionary's Christmas

THERE was a Danish Sky Pilot's Christmas which I was allowed to share. He is now a venerable dignitary of his church in Denmark. At the time of which I write, he was missionary to Danes and Danish sailors in a foreign port. A handsome fellow, standing about six feet four inches, with a mass of dark brown curly hair and sparkling brown eyes, he was a gentleman in every way. For weeks before Christmas huge packing cases had been arriving from Copenhagen. There was always a ceremony at his house on Christmas morning. A thin covering of snow was floating down softly through the still air. Two little girls, warmly clad, were standing at the door of a near-by house, with their daintily decorated box, within the covers of which I knew they had carefully tucked a favorite doll, to represent the Christ-child. Their rather uncertain little voices were being raised in an attempt to sing a little Christmas melody, which had come down the centuries from nobody knows where, and had been sung in many languages by little children for probably more than a thousand Christmases. It will be sung by millions next Christmas, wherever the Christmas faith holds sway.

"God bless the master of this house.
    Likewise the mistress too;
And all the little children
    That round the table go;
And all your kin and kinsmen
    That dwell both far and near.
We wish them a merry Christmas
    And a happy New Year."

The first appearance of the lines in English seems to have been in "Gammer Gurton's Garland," itself of unknown date.

As I passed, the door opened, and they were smilingly welcomed, to rehearse their little ceremony within.

In the large dining-room of my friend's house, there was a genuine and impressive Danish Christmas scene. Denmark was in that room, and Copenhagen in particular. It had something in common with England or America, but nobody could have mistaken it for either. It was elaborately decorated—nearly everything had been sent from the homeland, including the Christmas tree. Seasonable mottoes, framed in designs of holly, with an abundance of red berries and mistletoe. The Christmas tree, in the center of the room, was lighted with many colored lights, and laden with numerous packages, while around it was almost a mountain of parcels, wrapped in decorated paper. Since it was daylight, the window-shades had been closely drawn to give more effect to the illuminations on the tree. On this account, it was not easy, at first, to take in the scene. As I entered, a chant was being sung in the slow, measured way, characteristic of the Lutheran churches. The voices were male, but on getting my sight, I saw that the hostess and some of her little girls were making a brave attempt to take what they considered their dutiful part.

It was reverential, somewhat somber, and when one's eyes grew a little clearer, and the singing was over, I saw about forty men, Danish sailors of every rank. Their ships were in the city docks—they were far from home, but Christmas provided them with this opportunity of national fellowship. What sturdy figures they were! Big fellows, grave faces, skins colored mahogany by sea weather; noble specimens of the Viking breed. In their old lumbering wooden tubs, in the Baltic, the Skagerack, the North Sea and the North Atlantic, they had tumbled about for a quarter of a century and more. Here you have real democrats. The fellowship of toil and peril makes the difference between captain and carpenter very small. But what gentlemen they were!

A Danish Apple-pie Is Different

A LITTLE daughter of the house, with the assistance of father and mother, handed out the packages. First there were those from relatives, addressed to some of the men, through the pastor, and then the little girl handed to each man a package from the tree, and one from the pile around. They received their gift from her hand with as knightly a curtsy as I have ever witnessed. Followed a restained merriment as they opened the packages and compared their gifts.

In an adjoining room, we sat down to lunch, prepared by one who knew what pleased the palate of a Danish boy. I learned that a Danish boy loves apple-pie, when he can get the native sort. Did you ever see a Danish apple-pie, or taste one? No! It isn't a bit like our American apple-pie. This is the thing glorified! The American ice-pudding, made by an expert, is the only comparison I can conceive. Anyway, having had Danish apple-pie, you refrain from praising our homemade article in the presence of one of those solemn-faced sons of the North.

A pretty little bit of ritual marked the close of the meal. All rising together, the visitors made a slight bow to the hostess, and said "Thank you." This was repeated to the host; then each to the man opposite him, or nearest him. I fear we wouldn't have the self-composure or the grace to do this.

Deeply interested, and thoroughly enjoying these proceedings, we had forgotten the weather outside, and though it had now stopped snowing, it had, in the meantime, laid on two or three inches, and the stillness in the air had given place to a searching breeze In those days automobiles were not considered serviceable in winter, and street cars did not run at all in that city on Christmas Day. But, well rigged for the weather, strong blood in our veins, and great expectations of what was yet in store, gave a wholesome contempt for snow, wind or consequences.

Some two and a half miles south by west had to be beaten, with some tacking now to one quarter and now to the other, to make a few calls on "shut-ins," we at last cast anchor in the "Sailors' Children's Home." Here was served a dinner of roast beef, turkey, plum-pudding, with all the trimmings, to nearly three hundred sailors' orphans.

Old Carols Are Sung

IT IS a large hall, given by one of the big boys. There is plenty of room. Near the kitchen is a long table; you can scarcely see it for the steam that is rising from it. Around it, on guard, stands a small army of men and women, in white aprons, jackets and caps. They are volunteers and count among them some of the wealthiest and most influential people in the city. The pianist starts up a lively march, and feet begin to move. The doors swing open, and tiny tots, from four years of age, blithely enter; but smitten by the beauty of the scene, and the eagerness in their hearts, some of them have to be seized by friends standing near, as they stumble and threaten to spoil their spotless little dresses, and perhaps stain their faces with tears; but guided by their foster-mother, who has a face as ruddy and genial as that of Father Christmas himself, they finally reach the place allotted them. The bigger ones come streaming in and stand in lines at the tables. Their ages run from four to sixteen. The girls' dresses are of various shades, but blue and white prevail. On each dress, you find worked in, somewhere, a star, emblem of the North Star, by which their fathers had sailed the northern seas and oceans. The boys wear blue knickers, white jumpers, with red stars, the colors of the flag. At a sign, heads were bowed, eyes closed (or supposed to be), hands clasped, and three hundred wonderful voices struck instantly the opening note of the blessing. No cleric, formally muttering a few sentences, could be a fitting substitute for that song. After that it cooled off gradually.

Two hours later we came back into the hall and a huge Christmas tree, which had been in hiding in a side room, filled the central place of honor. The oldest carols were sung, and then all those six hundred eyes were turned upon a certain door. The moment for which all the previous moments existed had now arrived. Father Christmas, or Santa Claus, or Kris Kringle, whichever you prefer, appeared, pompous, magnificent, smiling, with a body of attendants. Nature and experience alike had prepared Father Christmas. He was a retired sea-captain, round and ruddy.

The three hundred jumped to their feet and sang, "For he's a jolly good fellow," and then the gifts were distributed

The Jewish Attempt to Bolshevize the Negro

Manhattan's Red Propaganda Employed to Stir Workers of Harlem

By LLEWELLYN SMITH

The writer of this article and others to follow is a Negro sociologist who is particularly interested in the larger aspects of America's racial problems. During the war he conducted a series of investigations dealing with the growth of radicalism among the Negroes, which took him to the "black belts" of both the North and the South. At present he is on the staff of a social service organization, national in its scope, which is devoting a great deal of attention to the study of some of the basic contributing factors to the so-called Negro problem.

IN THE spring of 1922 the residents of Harlem, the "Black Belt" of New York City, were stirred by the news of the appointment of a Negro poet, Claude McKay, a son of the broad-leafed hills of Jamaica, the West Indies, to the editorial board of the *Liberator,* that blood-red Socialist periodical which is being edited by Max Eastman, formerly instructor in philosophy at Columbia University.

Immediately the Negro press began to bristle with biographical sketches of the poet. Nor was this to-do limited to the black editorial tyros. The white press devoted a great deal of space to the movements of this Occidental Poushkin. If McKay, attired like a Turkish sultan, chose to go to a radical "gambol" at one of the myriad "art" dives on Staten Island or in the Jewish East Side Ghetto of Manhattan, be assured that the old New York *Call* on its magazine page the following Sunday would carry a glamorous caricature of it.

If, as was his wont, the poet chose to don a flaming scarlet shirt—à la Mephistopheles—and to give readings of his exotic poetry to the yawping dilettantes that frequented the "White Peacock" or the "Garden of Joy" (after the McKay appointment, Greenwich Village began to move uptown to the Negro section, and the result was the establishment of a string of stuffy "cafés" and "tea shops" on the order of the "Café Royal" and the "Russian Bear" on Second avenue), the American Negro press, usually very conservative on matters of this sort, would give ecstatic accounts of them.

"It is so like Claude . . . . so Bohemian."

The Evening in Harlem

WHILE these readings, on racially esthetic grounds, provoked a deal of interest, and added to McKay's Negro disciples, they were significant for the foreigners, white people, largely Jews, they emptied into the lap of the "Black Belt." That the Negroes resented this—this encroachment on what they call their sacred preserves—is a pretty well-known fact. In fact, the very thought, the reaction of the Negroes to this flood of whites, has been epitomized and presented in a sketch from the pen of a Negro writer which appeared in the September number of *Opportunity,* a magazine devoted to racial affairs, and published under the auspices of the National Urban League. The sketch is entitled "The Stone Rebounds." It follows:

> It is night. I am in dark Harlem. I am walking along Seventh avenue, in company with a Negro playwright. I had met him at a radical forum downtown. I pride myself on being an intellectual anarchist; I haven't any prejudices. I am interested in the Negro problem. Interested in it the same as I am interested in Russia and India and Korea. I want to see Society take on a different shape. I am a radical. I stick to my Negro friend. I take him around with me. I run the risk of being ostracized. I remember once I took him to Barrett Manor. Barrett Manor is an art colony. Flappers and broken-down celebrities hang out there. It is a nice place. It is full of Doré's illustrations. I like it. Always I am lionized by the crowd. Of love and death, poetry and pragmatism, sex and the eternal will—of all these things I would talk. They would hang around and anticipate the words as they came from my lips, especially the girls. I was such a favorite there. Then I took my Negro friend there. Why not? My friend is more intellectual than I. I realize it. I am big enough to admit it. In the old days as soon as I opened the wire-screened door they would all flock to greet me—but that day I shall never forget it. I let my friend in first. I went in afterward. What a change! I was no longer the idol, the master conversationalist; no, I had fallen. Fallen from grace; fallen like Lucifer. That entire day I felt a pang of remorse at what it was to be white. Earl, superman that he is, did not seem to notice it. Why should he? It was his first visit there. But it galled me. I have tabooed Barrett Manor. I haven't been there since.
>
> I think of all these things as I swing up the avenue. And my confession! As much as I had tried, I couldn't conceal it. At first I used to blame it on the bourgeoise; but Earl was wise. I could see it in the way he'd smile. Smiling out of the corner of his mouth!
>
> So I decided to tell him. I laid my cards on the table. It is useless, I said, trying to run up against a stone wall—a gibraltar of prejudice. Useless! I didn't have any difficulty bringing him to my point of view. Yes, he said, he had felt it all along—at the restaurant, the theater, on the bus, in Greenwich Village; yes, it had followed us, like a starving wolf. But my friend, noncombatant that he is, suggested a way out. Why not let us meet up in Harlem, Black Harlem? Surely . . . .—— No, I hadn't any objection, I hastily assured him. Truth is, the idea thrilled me. I long wanted to visit the place. I had heard so much about it.
>
> "It is in here."
>
> I am jerked out of my reverie. I am on a dark maple-shaded street. I don't know how Earl manages it, but I suppose he knows the place very well. I follow him. It is down in a basement. A sheet of purple is over everything. Dimly I make it out. Witch-like silhouettes belt it. Over the fireplace is a white peacock, a majestic looking bird. On the wall, over the piano, is a girl sitting on the bough of a huge cypress, playing a harp. Sunset shines through the branches. Besides the piano is a bookcase, and on the center table is a medieval lamp. Its chimney is daubed with Oriental flowers. Quaint as can be. At once I take to it. I like the atmosphere. But the people in it. At a jut-like table is a girl, I don't know whether she is white or colored, talking to a man. I cannot see his face—it is away from me. But his neck I can see. It is black. I am being introduced around. I cannot always see their faces. The place is so romantically dark. It is a long time before I adjust my sight to the light. I am invited to a seat at the center table, and talk—group chatter—is resumed. A girl with pomegranate cheeks is on my right, and at my left is Earl. The girl is saying something to me.
>
> "Well, Mr. Kraus, how do you like it up here?"
>
> "Oh, I think it is great," I whispered dreamily. "It is so—Bohemian."
>
> The girl has creole eyes and I feast on them; but they are not magnetic enough to arrest the functioning of my other self—my subconscious self. I can hear Earl's soft musical voice as he leans over and talks to the lady with the Cossack hat, at his left.
>
> "No, he isn't colored. Jewish—a friend of mine. What? No, I don't think so. Kraus is a poet, not an anthropologist."
>
> "What is he doing up here then?"
>
> "He just came along with me, that's all."
>
> "Humph, that is funny."
>
> "What's funny?"
>
> "This white man coming up here—I don't understand it."
>
> "Oh, don't be silly, Daisy. I thought you always say you haven't any prejudice?"
>
> I am talking to the dark-eyed girl at my elbow. Of course it is about the race question. Everyone seems to be talking about it these days. I ask her what are her views on that eternal bugaboo—social equality.
>
> "Well, it is this way," she begins, flipping the ash off her cigaret, "I am colored, and self-conscious. Very much so; I cannot get over it. It is part of me. I believe it ought to be so that if I want to marry a Dutchman, I can. I am of age, and I think I know what is best for me. More than the ignorant mob out on the street. Yes, I believe in social equality—if by social equality you mean intermarriage, and that is what it means nowadays."
>
> I don't know what sort of look has crept into my eyes, but it must be an alarming one.
>
> "Understand me clearly!" She hastened to add, "By that I do not mean that *I* personally wish to marry a white man. Get that straight."
>
> I am conscious of an enveloping silence. I drink the tea that is put before me and try to think up clever things to say. I cannot explain it. It is sepulchral—the silence. Even the girl beside me is taken up with the string of Spanish beads around her neck. Occasionally I would glance over at the woman on Earl's right. She is toying with the Japanese ash tray on the table. But I am sure now and then she emits a grunt. Something ugh-ish. I am sure of it. I look around. On me a houseful of eyes is cast. I do not feel out of place. I rejoice in the reaction. I know why they are staring at me. I am white."

Jewish Radicals at Work

OF COURSE, the writer of this article is not objecting to the appointment of Claude McKay (who is now in Russia gathering data for a book on Soviet Russia and the Negro) or any other Negro, for that matter, to the editorial staff of any white periodical. On the contrary, he believes that if colored men, like William Stanley Brathwaite, the poet, critic, and anthologist; Dr. William A. Hinton, instructor in the Harvard Medical School; Noah B. Thompson, librarian of the Los Angeles *Express;* Daniel Murray, librarian of Congress, ought to be able to develop their genius regardless of the fact that they belong to the Negro race. Briefly, if this were the case, colored men of the caliber of W. E. Burghardt DuBois, a poet and scholar of the highest water; Dr. William S. Scarborough, formerly president of Wilberforce University, one of the foremost Greek scholars in the country and now an assistant economist in the United States Department of Agriculture; Professor Alain Leroy Locke, a Rhodes scholar, professor of philosophy at Howard University, one of the brightest minds of the Negro race; Charles S. Johnson, a sociologist, psychologist, and anthropologist of brilliant promise; Ernest Just, the biologist, and others, had been able to develop their genius and not be labeled and pigeonholed as members of that unfortunate race, the Negroes, America and civilization as a whole would be enriched by it.

It is not against this group that we are quarreling. We are only enraged at the sordid, materialistic efforts of the Jewish radicals of Manhattan, that isle that is hopelessly anchored off the shores of Palestine, to convert the Negroes in America to their theory of economic determinism.

In New York there is a magazine, the *Messenger,* which is edited by two Negro Socialists, A. Philip Randolph and Chandler Owen. The *Messenger* prides itself on being "the only Negro labor organ in America." Happily its significance to the Negro working masses is almost negligible. In the first place, it purports to be the official organ of the "Friends of Negro Freedom." For the benefit of those who are unfamiliar with the orientations of Negro politics, the "Friends of Negro Freedom" is one of those mythical organizations that thrive on gab and the promulgation of a policy whose practicality is equivalent to firing stones at the stars. I might say, however, that the "Friends of Negro Freedom" is a gigantic joke. Like the African Blood Brotherhood, of Mr. Cyril Briggs, an octoroon, it is simply another attempt fostered by the radicals of the Jewish East Side to disseminate unrest and socialist propaganda among the Negroes. Compared with the Urban League, the Negro church, Hampton or Tuskegee, it does absolutely nothing to fit the Negro laboring classes mentally, spiritually, or otherwise, for the mighty task of survival. Messrs. Randolph and Owen, excellent fellows when it comes to rolling their r's or to dogmatizing on the economic rights of the black workingman, let it be said to their distinct credit, have not a single original idea between them, and, naïvely, do not pretend to have any. Really, the *Messenger* is a crude attempt to copy Mr. Villard's impossible *Nation.*

It "Copies" The Nation!

ON ECONOMIC or sociologic matters it gets its cue either from the *Nation* or the *Liberator*. For example, its 1923 "Labor Day Number" which had "greeting" advertisements from Jew organizations such as "The Joint Board of the Cloak, Skirt & Reefer Makers' Unions," "N. Y. District Council No. 9, Brotherhood of Painters, Decorators & Paperhangers of America," "Button Workers Union Local 132 of I. L. G. W. U.," "International Ladies Garment Workers Union," "Butcher Union of New York & Vicinity, Local 174"; contained messages of "brotherhood" from J. Ramsey McDonald, Samuel Gompers, John L. Lewis, and a native African labor leader. Knowing as I do the caliber of the Negro working classes, these brilliant dissertations mean nothing to them. I might go further and state (and this is not a reflection on the intelligence of the Negro workingman) that most of the politics and economics and psychology and anthropology that the intellectual moguls down at the Rand School like to pore over as the "orientations of new Negro thought" usually are beyond the comprehension of the Negro masses. In other words, what is paraded as the opinions of the up-and-thinking Negro is really the dogma and Socialist claptrap of the Jewish East Siders filtering through Randolph and Owen.

The very manner in which the *Messenger* is edited savors of Vesey street. To illustrate: It is running a series of vitriolic articles by Negro writers of various schools of thought called "These Colored United States" after the *Nation's* own "These United States." Obviously the omniscient editors of the *Messenger* are so consummately an example of what hybrid thinking can do that we are ofttimes tempted to remind them that while editors ought to lead and not follow the herd, the *Messenger* is ostensibly edited for folks the bulk of whose leadership lies and will continue to lie for some time to come in the hands of the Negro church and in Tuskegee, and that at bottom, to apply the words of W. E. Burghardt DuBois, by all odds the most bitter, the most polemical of Negro writers, that the Negro is sane and conservative and a believer in right and practical thinking.

And, proportionately, it is just about as effective as its white prototype.

Small wonder, then, that Mr. Villard in an article on Negro literature published in the "Literary Review of the New York Evening *Post*" for June 30, 1923, states:

> "As to the much discussed evidences of radicalism in the Negro press which so frightened our government during the war, Professor Detweiler ("Negro Press in the United States") faithfully records such testimony as he has discovered. The *Messenger* is, for example, a "brilliantly edited apostle of a mass movement of Negroes along Socialist lines, demanding complete equality and the right of intermarriage." Our government called it during the war "by long odds the most able and most dangerous of all the Negro publications"; . . . . Far too few white-edited magazines have the ability of the *Messenger;* none that I know of has its courage in expressing its views of race solidarity and race action born of the injustices its *clientele* endures.

* * *

The wonder is not, however, that such brilliant Negroes as Chandler Owen and A. Philip Randolph can be found, but that they can find so many readers—28,000 colored—to absorb their doctrines and support their papers.

It is beside the point to doubt Mr. Villard's figures of the *Messenger's* circulation. The important thing to consider is that the Jews, for some ulterior motive, are anxious to line up the Negroes on the side of Socialism and Communism. The appointment of Claude McKay by the Soviets to spread radical propaganda among the Negroes and the continued subsidy of the *Messenger* by the Socialist party of New York, in the face of the suspension of the *Call* and its successor, the *Leader,* are nothing short of an organized mass attempt to indoctrinate the Negroes with the spirit of syndicalist rebellion.

Artist by Instinct, Football Coach by Fate's Shuffle

"Bob" Zuppke Was Too Small to Play on a Varsity Eleven But Has Developed Into a Champion Coach

By GEORGE H. DACY

ROBERT ZUPPKE

IN THE exhibition rooms of the Art Institute in Chicago several paintings of attractive marine scenes are on display. They were painted by one of the most successful football coaches who ever wore a cleated shoe and taught the strategy and science of the popular pigskin sport.

"An artist by instinct but a football coach by fate's decree," tells the strange story of Robert Zuppke, mentor of the University of Illinois gridiron warriors, one of the most colorful instructors who ever schooled a neophyte in the rudiments of the punt and drop kick.

Twenty-two years ago, Zuppke first appeared on the football field at the University of Wisconsin, a candidate for the eleven during the days when beef and brawn were prerequisites. "Bob" weighed but 135 pounds and he could walk through a sixty-eight inch door wearing a derby hat. A pygmy in stature, Zuppke was a giant in nerve and courage. He was the smallest man in avoirdupois and the largest candidate in pluck who tried for the eleven that autumn.

For three seasons, Zuppke worked bravely to win a place on the varsity. He never shirked a tackle; he never dodged a crashing play; he was the most daring of the second string players. Zuppke was a frequent visitor to the university infirmary for rest and repairs. But no matter how hard he was hit and hurt, he always came back in a few days for more rough usage. "Battling Bob" never won a place on the Badger varsity but he did win the respect and admiration of all who watched him play. During the winter season, he was a talented performer on the Wisconsin basket ball team and was a star member of the quintet of that period which won the western title.

Zuppke's education was self-financed. He paid most of his college expenses by painting signs. During the summer vacation, he drifted about the country painting billboards. Finally, Zuppke studied composition and began to paint on canvas instead of on signboards and buildings.

Completing his work at Wisconsin, where he specialized in psychology, "Zupp," as he was called by his classmates, went to New York City where he spent one year of delightful work under the direction of the Art League. In some way, Zuppke then turned to football coaching. His first charge was Muskegon, Michigan, where he molded inexperienced high school material into a team which won the state championship.

Zupp" in action.

The following year, Zuppke was called to Oak Park (Chicago) high school where he developed an interscholastic eleven which lost but a single game in three seasons. This aggregation easily won the interscholastic championship of the United States. The authorities at the University of Illinois were then combing America for a football coach. After investigating his record carefully, they decided that Zuppke, who loved to paint but who turned to football instead of his easel as a livelihood, was a made-to-order candidate for the Illinois vacancy.

For ten years "Bob" Zuppke has been teaching the "fighting Illini" how to play football. During his first three years at the state university, he developed teams which twice won the Western Conference football championship. Under his tutelage, the wearers of the orange and blue made the best records in the history of the sport at the down-state institution. The Zuppke teams are always polished examples of football finesse and strategy. This particular coach wins many games by outguessing his rivals and then outmaneuvering them at their favorite variety of play.

Psychological tests somewhat similar to those employed during war days to learn the particular adaptability of certain officers and soldiers for specified lines of duty are employed by Zuppke to sleuth out the special qualifications of his football candidates. These examinations show the abilities of the various players to act rapidly and effectively in a crisis. They demonstrate the individual qualifications of the contestants.

In his chalk talks to the Illinois players, Zuppke recruits his sketching ability to explain complicated plays to his student squadmen. Deftly, he will draw a picture in crayon of the exact posture and place of each man in each formation. The "skull sessions" are usually held in the evening. The following afternoon, the players practice the new plays which they learned during the blackboard drill the preceding evening. One time, latterly, Illinois won the championship of the Middle West from the University of Minnesota on plays which Zuppke taught to his pupils on the train going to Minneapolis the day before the crucial contest.

Zuppke overflows with dynamic magnetism and can incite an audience to the peak pitches of enthusiasm, yet he modestly claims that he is no orator. As a teacher of football, Zuppke is so popular that the summer coaching courses which he conducts at the University of Illinois attract athletic directors and football teachers from all parts of the United States. His writings—several books and a number of magazine articles on football—are widely read. Any time he gets tired of football, Zuppke can make an attractive living painting marines.

"The hardest job that I ever tackle," remarked Zuppke, "is to get my boys in the proper mental condition for a game. It is outstandingly essential to keep the players from becoming overconfident. It is necessary to arouse their fighting spirit. Sometimes, each player on the team has to be handled differently to get him into the ideal frame of mind for the contest. This requires tact and diplomacy. It is more arduous and gruelling than the active strain of championship play."

Zuppke has two diversions and hobbies besides football. One is painting and the other, Boy Scout work. Ordinarily at the end of the football season, the Illinois coach is a physical wreck since for three months he thinks and talks nothing but football.

He uses the queerest tonic in all creation to bring himself to normalcy. He literally goes on a painting spree. Posthaste, he travels to the seashore where he studies sunlight conditions, colors, composition and other features of the technique of painting. After mastering all these art riddles, Zuppke begins to daub oil on canvas and paint marines. Day by day, he gradually regains his poise and good nature. After a month of painting, he looks like a man who has been rehabilitated at a modern rest cure. Then he turns his attention to Boy Scout activities. Painting and scout work may seem to you to be extraordinary avenues of diversion for one of America's best football coaches. Nevertheless, they keep "Bob" Zuppke tuned up for the practice of his novel profession. They enable him to work at top speed like a sixty-cylinder engine of unlimited horse power. That is enough guaranty to the most of us to prove that they are worth while.

A Pink Elephant, Chattering Monkey

Concluded from page 3

paraded about the streets and showed off their dainty pet. They acknowledged a willingness to let the animal go provided the purchaser could guarantee to supply the monkey with a good home. They did not peddle the beast long for a willing purchaser hove into sight. And he paid Collins and Tobin $40 for the monkey, giving them a clear profit of $5.

It has often happened that the mascot of a ball team is a four-legged creature of some kind. Quite often it is a bird, but the story of the American batting championship is the story of a pink elephant.

Late in the season of 1920 Detroit was playing a series in Boston. Harry Heilmann at that time was considered a .300 batsman and nothing more. During the stay of the Detroit team a Boston friend showed Heilmann a tiny pink elephant, a watch charm. "Here is the greatest luck bringer in the world," explained the friend to Heilmann. "This little pink elephant can make you the best batsman in baseball. Here, take it and wear it always."

Heilmann took the pink elephant and carried it away with him. He carried it through the winter and he still had it when the season of 1921 opened. Heilmann began hitting at a tremendous clip. Then, suddenly, he slumped. Heilmann, who had carried the pink elephant under his playing shirt daily, had lost his charm. His batting streak stopped on the day that he missed the pink elephant.

All efforts to find the pink elephant failed. Heilmann advertised in the newspapers, searched everywhere, asked all his friends, but could not find the charm.

Many persons, hearing that Heilmann had lost his pink elephant, offered to replace it. He was given white elephants and green elephants, black and blue elephants, miniature turtles, camels, frogs, buffaloes, Buddhas, bears, tigers, lions, horses, bathing girls, almost every kind of tiny luck charm known. But Heilmann knew that only the pink elephant could help his batting average, THE PARTICULAR pink elephant.

Heilmann despaired of ever seeing his charm again when, one afternoon, Harry Hooper walking in from right field as Heilmann passed him in going out to his position, held out something in the palm of his hand. "Look at this queer object I just found out there in right," said Hopper. "Some woman must have dropped it."

Heilmann looked. Then Heilmann jumped and grabbed the object from Hooper's hand. It was his pink elephant.

He did not lose it again in 1921 and he won the batting championship that season, the first time that a right-handed batsman led the field in the American League in years and years.

The following year, 1922, Heilmann was going well when the pink elephant became lost again. He did not recover it until late in the season. It had been mislaid. But the pink elephant stayed away too long and during its absence Heilmann had all sorts of bad luck, finally meeting with an accident in Washington that laid him out for the remainder of the season. Only while he was recovering in a hospital did the pink elephant reappear and then it was too late. Heilmann finished well up in batting but not on top.

In 1923 he had the pink elephant at the start of the season and he succeeded in keeping it all through the baseball pennant race. This time it was not lost or mislaid and Heilmann finished the season with the best batting average made in the majors and the best of his entire career.

So you see how the batting championship of the American League is wound around a pink elephant as second place money was carried by a mangy cur. And wherever you look deep enough into some big accomplishment in baseball you will, more likely than not, discover lurking somewhere a luck bearer just as strange as the few we have mentioned.

Clean-up of Fake Doctors On in Connecticut

Eastern State Has Harbored Many of the Bogus M. D. Degree Holders, Investigation Carried Out Under Direction of Governor Reveals

By J. OLIN HOWE

PROFESSOR WILLIAM P. SACHS, the Missouri educator who furnished the fake medical diploma ring with so many spurious high school certificates, believes there are 30,000 bogus doctors scattered over the United States. Discount this materially to allow for a stricken conscience; call the total number half that, as I have in a former article, and the situation is certainly no less appalling.

And a handful of unscrupulous men in St. Louis and Kansas City have made fortunes, hundreds of thousands of dollars, out of it all. Not out of dupes, for the taxi drivers, farmer boys, elevator conductors, clerks in offices or stores and the mass of other unskilled and often illiterate who took the short route to a doctor's degree, who bought these diplomas and paid to have their way to state licenses made easy, were never merely dupes; their eyes were open.

Yet they were on different footing from those individuals who are charged with having preyed on human frailties through fraudulent diploma mills—Dr. Ralph H. Voight, self-styled master mind of the group, and Dr. Date R. Alexander, secretary of the Kansas City College of Medicine and Surgery, of Kansas City, and Dr. Robert Adcox of the St. Louis College of Physicians and Surgeons.

While indictments are pending against these three, the Missouri State Board of Health has taken steps to revoke the charters of their institutions, the two mentioned and the Kansas City University of Physicians and Surgeons, a later affair which grew out of the increasing cupidity of the ring and the belief of its members in their own immunity. But Dean Waldo Briggs, of the St. Louis "college," remains at liberty, as does his secretary, Joseph Sintzel.

Professional "Exam" Takers

FAR more than this action by Missouri will be needed to stamp out this nation-wide evil. Or even than Colorado's belated effort to clear up the illegal diploma and license situation in that state, or what may come of the activities of the extraordinary grand jury in Connecticut.

The fake-diploma ring includes others than this St. Louis-Kansas City coterie. There is already indisposition to proceed in some quarters. One governor, at least, who has been furnished evidence that the Missouri diploma peddlers' operations involve his state, has failed to do anything about it thus far.

"It was not long before I discovered this examination business to be the fountainhead of a vast fraud which stretched across the country," says Dr. Sachs, himself under indictment but intent on everything possible to right the wrong in which he has been a factor. "Soon after I became state examiner for Missouri I went to Chicago to attend a big examination for candidates who desired to enter medical colleges.

"There were six hundred taking this examination—at the Englewood High School in Chicago—and to learn what went on I sat in with the boys and took the examination. I went out to lunch with them and was accepted on such terms that they talked freely to me. The examination took two days and by the end of the first I had discovered that fully fifty per cent of those answering questions were professional examination takers.

"Imagine my feelings when they told me they had been doing this sort of thing for years, to start on the road to medical practice an army of men too illiterate to pass a high school examination. I feel that at least half the Illinois entrance preliminary certificates are fraudulent, the examinations having been taken by a professional proxy. The certificates may be endorsed, signed and sealed by the proper authorities, but they are crooked, nevertheless."

Trick Photographs Used

ADCOX and Voight and Alexander have used similar methods in getting state medical licenses for their "graduates." The records show that the first has passed the Connecticut eclectic board at least twice under his own name, even. Voight tells of having taken hundreds of state medical examinations—had to do it before he got well enough acquainted to know how to use money to procure questions in advance.

"I was never caught at it but once," he says. "In Kansas City, Kansas, I was taking the examination for a young fellow who had just received a diploma, and as I wrote a man in authority whom I knew strolled over and asked, 'Who are you taking it for this time, Ralph?' I asked him to have lunch with me in Nance's café in Kansas City, Missouri.

"'How much are you getting?' he asked me as we ate. 'Seven hundred and fifty,' I said, 'and half is for you.' The old crook held out for five hundred (this is the way Voight related the incident to Harry Brundidge, the St. Louis newspaperman who by way of investigation became not only an M. D. but a chiropractor within two months by payment of some $1,200), but he finally took what I offered and kept his mouth shut. I finished the 'exam' and got the license."

Most states require a photograph of the applicant for medical license, but this presents no difficulty to the professional examination taker. He furnishes a trick photograph to be affixed to his application, an apparently perfectly good photograph but which has not been properly fixed and will fade out in sixty days or so. In the unlikely event of discovery of this in a state board's files the now-licensed doctor has but to furnish a photograph of himself and there is no way of knowing it different from the first.

When it comes to the bogus diplomas these fellows have sent broadcast over this country—and far outside—the plot really thickens. The diploma ring has put out fraudulent sheepskins bearing the names and seals of a dozen different medical colleges, of which only the St. Louis and Kansas City affairs were active.

Degrees From Mythical School

ONE is purely mythical—Eastern University Eclectic School of Medicine, of Baltimore, never chartered but, under the management of Frank J. Kenney, the "alma mater" of numbers of imitation doctors—but the majority had been in existence, had suspended for some good reason and somebody had kept diplomas, certificates, seals and other paraphernalia. Two were in California, two in Baltimore, one in Indiana, one in Washington, D. C., and three in Chicago.

Nor did these traffickers in fraud stop there. They have obtained diplomas of at least four reputable medical schools in different parts of the country—by corrupting individuals, presumably. Here, of course, is a very grave danger. States like Alabama and Minnesota, which have put the bars high against medical fakers, are in little danger from the ordinary methods of this ring, but the diploma of a school of standing and the high mark of a professional proxy on the license examination papers might prove an open sesame.

Meantime Connecticut occupies the center of the stage as the reservoir from which fake doctors could be distributed to other states and a special grand jury has begun the general clean-up where much damage has been done. The Nutmeg State has three medical boards—allopathic, homeopathic, eclectic—appointed by the governor at the suggestion of their respective societies and the State Board of Health issues licenses to practice medicine upon their recommendation. Licenses must be revoked by a similar procedure, by the way.

"42 Boobs to Connecticut"

THE standards of the eclectic board have been notably low and its methods lax. It recognizes diplomas of twenty-four medical schools. Some of these are not eclectic, and but nine of them were ever recognized by the National Eclectic Medical Association, according to Dr. W. N. Mundy, of Forest, Ohio, its corresponding secretary.

All but one of these have suspended and some so long ago it is doubtful if they have a living graduate. The only eclectic medical college in the United States now is the Eclectic Medical College of Cincinnati.

Yet the Connecticut Eclectic Board accepts diplomas from nearly three times as many institutions as that society's national body ever approved, and among these are the mythical Eastern University of Baltimore and the Kansas City and St. Louis "colleges." The state of Missouri changed the words "reputable schools" in an old law to "legally chartered," against protests of reputable schools all over the country and even a referendum of the American Medical Association, and that let in these last two. Connecticut followed suit in recognizing them.

This made it much easier for the Missouri diploma ring in that state. Formerly obliged to work their trick of coaching candidates on 250 or 300 questions which included the sixty to eighty licensing boards might ask, they claim now to have established contacts which enabled them to get examination papers ahead of time and coach on only the questions actually to be asked.

"I took forty-two boobs to Connecticut," Voight bragged to Sachs, "and paid $500 for an advance copy of the questions and wrote the answers myself for the whole lot."

It is true that at times there is identical phraseology among a number of candidates' papers, but the venerable chairman of the board, an honest old country doctor, insists Voight's story cannot be true. He is too conservative, however, to suit some of these Connecticut holders of St. Louis and Kansas City diplomas.

"You failed in chemistry," wrote Dr. Frank Webb, of Bridgeport, to a St. Louis candidate (and the letter later turned up in St. Louis). "I went up to Durham to Dr. Markham (the chairman) and tried to get him to mark you, but he showed me your papers and we could not twist them around so they would conform to the law. Are you registered in Arkansas? If not, take the eclectic board there and get reciprocity with us."

Adcox and Alexander made no secret in Missouri of their ability to do about as they pleased with the Connecticut board and the latter raised his diploma price from $200 and $250 to $500 and later to $800 as he demonstrated his ability to take groups of his supposed graduates to Connecticut and help them pass the eclectic board.

Finally a member of the board died, Dr. E. H. Marsh, of Mansfield, and Dr. James Christian, of Fairfield, with a Kansas City diploma, was named in his place. Voight wrote Adcox then: "Alex. is trying to get one of his graduates on the board and will not go to Connecticut this time, as he is sure everything will be O. K."

Dr. Christian was secretary of the Connecticut Eclectic Medical Society and last spring wrote letters asking contributions to a large fund in support of legislation desired by certain eclectics, which will be told of later in this article. He never qualified as a member of the board, has since been deposed from his secretaryship and is among the initial eighteen doctors to have their Connecticut licenses revoked at the instance of the special grand jury.

Dr. Webb is another, and Dr. George M. Sutcliffe, of Unionville, one of whose patients died of suffocation after three cans of ether had been used in keeping him unconscious.

There has been a great scattering of these Connecticut doctors with eclectic licenses since the grand jury began its investigation following the St. Louis exposé. One has skipped to Brazil, a husband and wife who practiced together in New York City as well as in Connecticut have sailed for Europe, and others have gone to parts known and unknown. A few are defiant and threaten legal action over licenses which have been taken away from them. One has entered a Massachusetts medical college as a freshman.

Governor's Natural Mistake

INCIDENTALLY, the last examination of the Connecticut Eclectic Board was held July 11 and 12, 1923. Of the fifty-five candidates five were admitted to practice in Connecticut through reciprocity arrangements with other states, and thirty-one presented Kansas City diplomas. Among the fourteen scattering there may have been other fake diplomas. All but six of Dr. Alexander's thirty-one passed, and these have taken subsequent examinations and passed.

This Connecticut situation could easily have been foreseen. Scarcely a session of its legislature has been without validating acts making regular some doctor who wasn't up to standard. These have often been reported by the Judiciary committee rather than that on Public Health and Safety and their passage made a matter of politics. The chairmen of the Joint Committee on Judiciary, lawyers, are always majority leaders of the Senate and House of Representatives.

Had it not been that the state has a governor now who is a straightforward man interested only in his state's welfare, twenty-three more of these "doctors" would have been validated in one lot by the legislature which rose last June.

Both houses passed the bill, reported at the end of the session, and Governor Templeton vetoed it by a pocket veto. The legislative machine could have passed it over his veto, as it had others, but the legislature had adjourned and he had only to refrain from signing it for the measure to die. He couldn't see why men who had failed to pass examinations for license or doubted if they could or had some blot on their records should be legitimatized by act of the legislature.

Can you?

"Are we invaded by the Bolsheviki?" asked Governor Templeton of his executive secretary shortly before adjournment. He had seen in the capitol corridors *foreign-looking men, wearing tall hats but with days' growths of beard and hands and finger nails not over clean. That part of their conversation he had heard was in gutteral and broken English.*

"Don't you know who those are, Governor?"

"No."

"They're the men who are interested in that eclectic validating act," said the executive secretary.

Bill Fails on Pocket Veto

AT THE same time there came out of the same committee a measure reorganizing the Connecticut department of health, a new medical practice act which placed the licensing of doctors in the hands of a commission consisting of five members of the legislature.

They need not be doctors. Very likely they would have been lawyers. Certainly they would have been politicians. In any case, they would not necessarily have had expert knowledge of medicine or medical practice or medical ethics.

An advisory board from each of the three schools of medicine, allopathic, homeopathic and eclectic, would pass upon candidates, as now, but with no power to admit or reject them. The licensing would be in the hands of the commission alone. Physicians of highest repute about the state favored this plan—and so did the same men who favored the eclectic validating act. The Republican leader of the House was an especially strong supporter of the new medical practice act. Both houses passed this bill, also.

Yet do you think any five laymen competent to pass on the qualifications of the physician into whose keeping you may later give your life and the lives of your dear ones?

Governor Templeton didn't, and this measure, too, received a pocket veto. An awful howl went up, but he had done something for mankind.

International Science Briefs

By DR. ARVID REUTERDAHL
President, Ramsey Institute of Technology, St. Paul, Minnesota.

The Cosmic Energy Unit and the Atom

IN RECENT years science has given exhaustive attention to the study of the phenomenon of light. Much of the advance made in our knowledge of the atomic structure is due to the facts revealed by experiments made upon light-radiating substances. Spectrum analysis brings us into close relationship with the characteristics of the various types of atoms. Everyone is familiar with the fact that an ordinary triangular prism refracts white light rays into beautiful rainbow colored bands. Such bands are called *"spectral bands,"* whose colors range from the deepest red, through orange, yellow, green, blue, to the deepest violet. Each individual color corresponds to light of one particular wave-length. White light is a composite of many different rates of vibration and wave-length. The glass prism separates the composite white light into its constituents. When all the strings of a mandolin are set into vibration at the same time, then a composite sound is produced which corresponds to the production of white light by means of many simultaneous but different vibration rates. When a single string of the mandolin is plucked, then one definite sound is produced. This case has a counterpart in the production of one-colored or monochromatic light which is revealed by the glass prism, not as a continuous rainbow band of color but as a series of distinct lines called *"spectral lines."* Incandescent vapors and gases produce spectral lines which indicate particular vibration rates and wave-lengths. The production of a definite *spectral line* corresponds to the plucking of a single string of the mandolin, whereas the development of an entire *spectral band* has its counterpart in the simultaneous plucking of all the strings.

In the production of spectral bands and lines, what is it that physically corresponds to the strings of the mandolin? There is just one answer—the atoms of the substance from which the light radiations emanate. The parallel is completed when we point out that as a string of a certain gauge is capable of producing a definite sound corresponding to a particular rate of vibration, in an analogous manner a specific atom can develop typical vibrations which reveal corresponding characteristic spectral lines in the spectrum. A spectral line or group of lines is therefore an indicator of a particular atom.

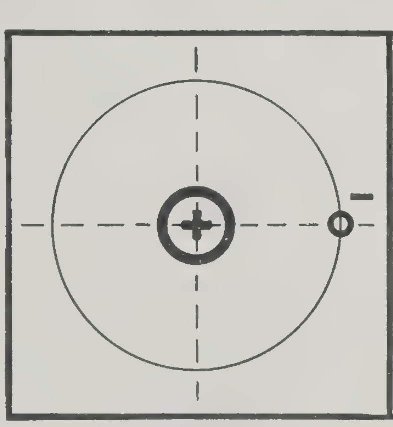
We are absolutely certain today that atoms and groups of atoms are generators of light rays. The name *molecule* has been adopted to represent groups of atoms which are associated with a fair degree of permanence. The atom itself is a group structure composed of sub-atomic particles called *electrons, protons,* or *positons.* Light of different colors is produced by the vibration of molecules, atoms, and electrons. Color is considered as directly connected and dependent upon the number of vibrations a second, that is, the *frequency.* Atoms which vibrate at a fast rate and electrons whose frequency of vibration is low produce the entire range of visible light. Molecular vibrations of low frequency correspond to colors beyond the red. When the frequency of the electronic vibration is sufficiently increased, then the color is found at the other extreme of the spectral band in the ultra-violet.

The radiation of light is equivalent to the radiation of energy. The little machine which discharges this energy is the atom. It is an almost unexpected fact that light-energy is not radiated continuously. In the year 1900, Dr. Max Planck formulated his first definite conclusions concerning the emission of energy during atomic vibration. Instead of energy flowing, as it were, in a steady stream from an atom, it is dispensed in distinct and minute *equal* amounts. Every vibration of an atom, during the production of light, is accompanied by the liberation and dispensation of *one cosmic energy unit.* This small amount of energy has been called *Planck's Constant.* The familiar medicine dropper may serve to illustrate the facts involved in the generation of monochromatic light in particular. Assume that the glass tube of the dropper has been filled with water. Every time that the rubber bulb is properly squeezed a drop of water is discharged from the end of the glass tube. Each drop corresponds to Planck's cosmic energy unit and each act of squeezing the bulb is analogous to one vibration of the light-producing atom. Suppose that forty drops are ejected by forty squeezes of the bulb and that this exhausts the water supply in the glass tube. The total amount of water discharged is then found by multiplying the amount of water in one drop by the number of compressions of the bulb. This total amount of water corresponds with an analogous amount of energy called a *"quantum"* in Planck's theory. If every vibration liberates one cosmic energy unit then a *quantum* is the total amount of energy radiated in one second.

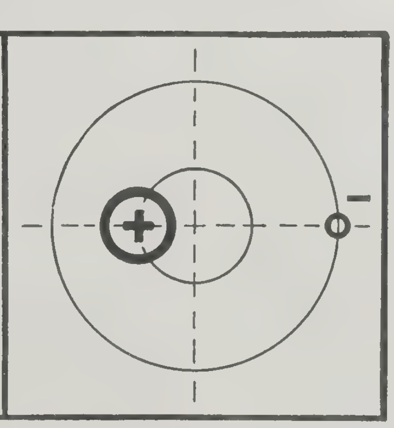
The magnitude of the cosmic energy unit (Planck's Constant) is so small that if one unit is liberated every second, more than thirty-six octillion years will be required to equal the work a second, in foot pounds, represented by one horse power. If a counting device could count one billion trillions a second, then it would require more than thirty-six million years for the machine to produce the required value.

Modern scientists design mechanical models to represent the physical mechanism involved in the production of particular types of physical phenomena. An atomic model, to meet the specifications furnished by nature, must be able to represent satisfactorily the vibratory generation of light. The outstanding atomic models designed since the year 1900 are due to Dr. P. Lenard, of Heidelberg, Dr. Niels Bohr, of Copenhagen; and the *octet model,* known as the Lewis-Langmuir atom, developed principally by Dr. Irving Langmuir of the American General Electric Company. Sir Ernest Rutherford's atomic model is an adaptation of Lenard's *Dynamide* atom, and Dr. Arnold Sommerfeld's type of atom is a variation and expansion of the Bohr atom.

Bohr was the first physicist who attempted to design an atomic model incorporating the new facts presented by Planck in his so-called *Quantum Theory* of energy radiation. Bohr conceived his atomic structure as composed of a series of definite concentric orbits in which electronic particles could travel. If an electron circulated constantly in one of these orbits then light radiations could not occur, but when it passed from an outer to an inner orbit then monochromatic light radiations were emitted. Bohr's so-called stationary orbits are purely arbitrary and do not follow as direct consequences of some more fundamental principle. His work in the atomic field, however, will remain as one of the monumental contributions of modern science. Great ingenuity has been shown by Dr. G. N. Lewis and particularly by Dr. Irving Langmuir in designing a number of molecular structures.

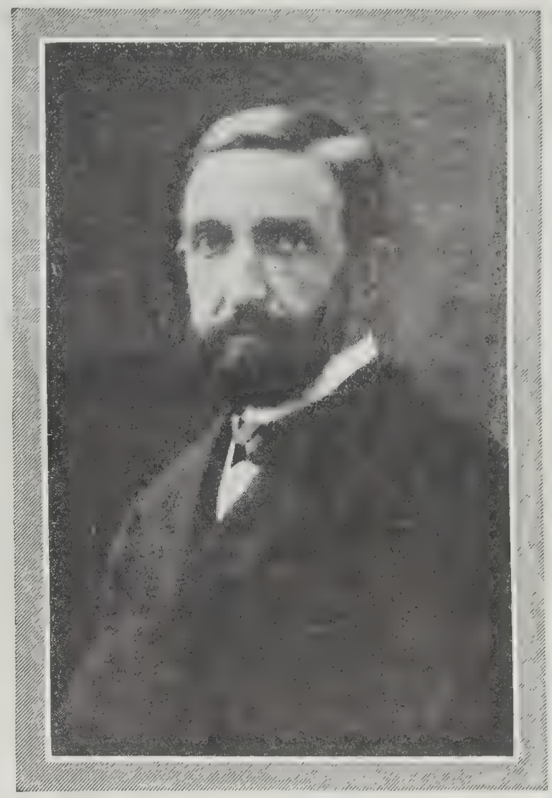


Professor Niels Bohr's model of the hydrogen atom. The positive nucleus (positon) is located at the geometric center of the outer electronic orbit. The electronic dimensions remain unchanged during radiation and absorption of energy.



The space-time potential hydrogen atom. The positive nucleus (positon) and the negative electron rotate about the neutral point of the entire system. Both orbits contract and expand radially. Energy is radiated during contraction and absorbed during expansion.

The writer's "Space-Time Potential Atom" (Academy of Nations Press, 1923) is a logical consequence of his conception of space and time as a generating screen or *Matrix* in which energy develops and exhibits itself as matter in action or motion. Every point upon this screen has a relative energy value. All the points along the same atomic orbit have the same energy value. When an electron moves along such an orbit radiation of energy in the form of light cannot take place because every point on the orbit represents the same energy value. If the electron moves in an inwardly direction to an orbit of smaller energy value, then energy must be emitted. Radiation, in this atomic model, is a natural consequence, therefore, of the laws of the Space-Time Matrix.



DR. P. LENARD,

Nobel Prize winner in Physics, director of the Radiological Institute, Heidelberg, Germany, who advanced the Dynamide Theory of Atoms in 1903. Sir E. Rutherford's Atomic Theory, advanced in 1913, is an adaptation of Professor Lenard's earlier Dynamide Theory.

The Space-Time Potential Atomic model for hydrogen and the Bohr model agree in regarding this structure as composed of an electron and a positive nucleus or *positon.*

In practically all other respects these two models differ radically. In the Bohr model the positive nucleus is located at the center of the electronic orbit whereas in the Space-Time Potential model the position is eccentrically located and travels in an orbit whose center coincides with the center of the electronic orbit. The electron of Bohr is fixed and unchangeable in its physical dimensions. Dr. Robert A. Millikan, the great American physicist, has pointed out, with deep insight, that the fixed electron adopted by Bohr is incapable of explaining the phenomenon of light radiation.

In the Space-Time Potential Atom the electron is a variable physical entity. This model regards the outer electronic and inner positonic orbits of the hydrogen atom as equivalent to two perfectly elastic rings capable of uniform radial compression and expansion. When pressure is exerted upon this two-ring system both rings contract in the same manner as a toy balloon when the air is permitted to escape. During compression the masses of the electron and the positon and all the other physical quantities which pertain to the two particles undergo compensating changes in conformity with the laws of the Space-Time Matrix.

The common center or *neutral point* of the electronic and positonic orbits of the Space-Time Potential Atom is not devoid of physical significance. On the contrary, every point in the Space-Time Matrix has a definite relative physical value. In the atom the *neutral point* is the abode of a particle which does not gyrate like the electron and positon. It possesses no other physical property than pure mass prior to the application of some deforming physical intensity. The principal function of this pure mass particle, the *potention,* is to produce, in conjunction with a neutral gyratory material medium, those transverse disturbances which are known as light waves.

In the Space-Time Potential Atom a genuine physical basis for Planck's energy unit has been provided for the first time and the generation of light by atomic motion becomes physically conceivable.

BRIEFLY TOLD

From Germany came 100,000 soldiers last week. They were toy soldiers for the Christmas trade.

When a German circus man, about to go to South America with his show, advertised for 300 acrobats and other performers he received applications from 60,000, ranging from former Uhlan officers to day laborers, many offering a bonus in the form of potatoes if they obtained positions.

A military map, used by the British at the battle of Bunker Hill, recently sold at an auction room in London for $950. The map, eight inches square, bears the signature of Major General Sir Henry Clinton.

Swiss watchmakers can split a hair into 500 strips and measure the thickness, so exact are their tools.

Where there is no violation of treaty stipulation, the individual states have the Constitutional right to pass laws prohibiting the ownership of land by aliens, according to a United States Supreme Court ruling.

Sixty-five per cent of the 219,000,000 acres of forests in private hands are entirely without fire prevention regulations.

Captain Alexander Aaronsohn, lecturing in Detroit, was asked by an auditor if the troubles of the Jews were not due to their unethical business methods. He replied, "There are about 3,000,000 Jews in the United States and 100,000,000 Christians. Where do you suppose they got their unethical methods if not from the people they live among?" So that question is settled. American Christianity is responsible for the business ethics of Jews who in Russia, Poland, Germany and Turkey are models of honor.

"In the age of rings, trusts, mergers, combines and monopolies, newspapers are bought and sold like butter and soap. The opinion-making power is in the main the instrument of money . . . The old artifice of despotism was 'tuning the pulpits.' It was a process weak by comparison. Tuning the press is an affair more comprehensive and more concealed."—London *Observer*.

One of the two famous Scottish snuff dealers is going out of business as a result of the passing habit of taking snuff. O'Conner, "Father of the House of Commons," is the only man at present in public life in London who keeps up the snuff habit.

All United States mail planes are to be equipped with wireless.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

It took some persuasion to convince the Mongolian Government that the purposes of the Andrews third Asiatic Expedition were purely scientific. An elaborate expedition of twenty-six men, seventy-five camels and motor cars was not believed to be looking for old bones. A quest for gold and oil was thought more likely.

"Piety is indifferent whether she enters at the eye or at the ear. There is none of the senses at which she does not knock one day or other. The Puritans forgot this, and thrust Beauty out of the meetinghouse and slammed the door in her face." —*James Russell Lowell.*

Roy Chapman Andrews of the Asiatic Expedition in China overdrew the Expedition's account with the American Banking Company at Pekin. When the bank asked for more security Andrews offered two dinosaur eggs ten million years old. The banker refused to consider the eggs as collateral and it was necessary to sell the American-made automobiles which brought half the original cost despite the fact that they had traveled 6,000 miles over camel trails of Northern China.

Storing thousands of tons of coal under water, the Western Electric Company of Chicago has found an absolute remedy against loss by fire caused by spontaneous combustion.

"The majority of crimes of today are committed by boys under twenty-one—seventy-five per cent by youths under twenty-five. The average home is nothing more than a place to eat and sleep. It has ceased to be a shrine for moral and religious training. Jazz life, cheap reading and cheap thinking are the chief characteristics of modern people."—*Judge W. C. Harris,* of Emporia, Kansas, president of the Kansas State Bar Association.

A flea became entangled in castor oil 3,000 years ago in Tutankhamen's tomb. It now reposes in the museum at Cairo and is generally regarded as the only flea mummy in the world.

Horace Greeley did not say, "Go West, young man." This expression was first used by John L. Soule in 1851 in the Terre Haute *Express*. Greeley later used the sentence in an editorial entitled "Hints Toward Reform." Later Greeley reprinted the article from the Terre Haute *Express* and explained that he was not the originator of the expression.

"The crowning fortune of a man is to be born to some pursuit which finds him employment and happiness, whether it be to make baskets, or broadswords, or canals, or statues, or songs."—*Emerson.*

"Real political issues cannot be manufactured by the leaders of political parties, and real ones cannot be evaded by political parties. The real political issues of the day declare themselves, and come out of the depths of that deep which we call public opinion."—*James A. Garfield.*

The greatest observatory in the world is being built on Mont Saleve, a peak 4,300 feet high in Savoy near Mont Blanc, France. The builder is Asan Dina, an East Indian engineer.

Fifteen million women and children have died of starvation and disease in Europe and the Near East as a result of the series of wars which began in 1914.

The income of the American people was about $66,000,000,000 in 1919, and interest on the national debt is about $940,000,000 a year. The national debt, at the present rate of reduction, will be extinguished by 1952.

WITH CHRISTMAS NEAR IS WORRY FAR BEHIND?

¶WHAT TO GIVE!

¶ To many persons selecting suitable gifts is a real worry.

¶ A subscription to THE DEARBORN INDEPENDENT, with a check, written and mailed now, solves what to give.

¶ Inexpensive, yet carrying a real message, THE DEARBORN INDEPENDENT represents an ideal Christmas gift. For fifty-two weeks it will be a reminder of your regard and thoughtfulness.

¶ An attractive announcement card will be mailed with each gift subscription. Forward your subscription early, using the accompanying blank.

12-22-23

Enclosed is $.................covering Christmas gift subscriptions to The Dearborn Independent for the following:

CHRONICLER OF THE NEGLECTED TRUTH

Disagreements and Disappointments Mark 1923

Countries and Leaders Strive Toward Same Ends But Quarrel as How Best to Achieve Them; Future Uncertain But by No Means Unhopeful

By HARRY PENCE

FOR the most part the world seems determined to disagree and such agreements as have been arrived at during the closing year have been keen disappointments.

After a long diplomatic struggle the powers of the Old World surrendered to the Turk and permitted his re-establishment in Europe—an agreement, to be sure, but a disappointment.

The Corfu incident passed without war and with the withdrawal of the Italians from that island, but the terms by which this was brought about were not only disappointing but humiliating.

The outstanding complication of the year, however, has been that of German reparations and the French and Belgian effort to exact indemnities by force of arms.

The Ruhr Valley of Westphalia, the great coal and industrial district of Germany, is destined to become memorable as the scene of the mighty struggle which will definitely determine the reasonableness or the futility of expecting a country defeated in war to repair the damages it inflicted upon the victors.

The lesson may be useful in proving beyond dispute that in war even the victors lose but while the struggle is in progress that fact is scant consolation to a world suffering from its far-reaching effects.

It is impossible here to follow the development of this struggle in detail, nor is this the place to discuss the equitableness of the findings of the Reparations Commission. There seems no doubt that the amount demanded would tax Germany to her utmost even if she felt an obligation to repair her ravages and a national willingness to make a heroic effort to that end.

Detached economists seemed generally of the opinion that Germany could meet the demands only if permitted to rehabilitate her industries, if afforded raw materials and allowed open markets.

But an economically prosperous Germany meant also a Germany capable of resuming military activities and France was not alone in apprehensions of that contingency.

Occupation of the Ruhr

AT THE Peace Conference in 1919 Premier Clemenceau insisted upon an independent Rhineland state as a buffer between France and England and surrendered the demand only on condition that America and England join in an agreement to aid France in event of an unprovoked attack by her late foe. That treaty was formulated, England ratified it but our Senate rejected it, thus nullifying the three-party agreement.

As the "father of victory" Georges Clemenceau aspired to the presidency of France but his failure to obtain this protection or the buffer state turned French sentiment against him and retired him to private life as the "loser of the peace."

Neither he nor the French people would believe that Germany had disarmed in compliance with the treaty. When he visited this country last year he declared that the Germans plotted a new war on France, that they had large stores of hidden arms and munitions and were secretly drilling to make effective use of them.

Reasonable or ridiculous, the belief became the animating basis of French policy and when Germany declared the terms impossible and spent most of the year 1922 pleading for abatements and extensions of time the French clamored for direct action.

England not only refused to participate in a military entry into Germany to enforce payment but for many months held the French in check. When, however, the Turkish muddle brought with it the fall of David Lloyd George, the shrewdest and most resourceful of opportunists, the English were unable longer to restrain their allies.

The premiers of England, France, Belgium and Italy met in Paris January 1, 1923, and after four days of fruitless discussion their conference ended without agreement. That is, England refused to join in or approve direct action. Belgium and France, however, won the approval of Mussolini and reciprocity for this support stood the Italian in good stead in a later complication of his own.

Four days after the end of the conference French and Belgian troops crossed the Rhine and on January tenth entered Essen, the industrial capital of the Ruhr district.

The very same day President Harding ordered the return of all the American troops still on the Rhine. It was reported that England also contemplated withdrawing her army of occupation, but the advisability of retaining contact with the situation prevailed.

The government at Berlin denounced the invasion and sought to arouse world opinion against it. Criticism, however, was generally to the effect that the venture was ill-advised and destined to be unprofitable rather than that it was either illegal or unjust.

That the venture has so far been without direct profit and has entailed a heavy expense by no means indicates that it has not been entirely successful from the French point of view. In fact, a grave question has arisen. It is the great disagreement of the year 1923.

France went into the Ruhr for coal and German coal miners quit work. There were large stores of coal above ground and coke available for transportation but German train crews refused to operate the railroads for the benefit of the invaders. Municipal officials and industrial leaders incited the populace and "passive resistance" was soon under full headway.

Though "passive," the resistance was by no means tranquil. Riots and sabotage brought retaliations. Villages and cities were fined and individuals, leaders as well as rioters, were imprisoned. Thousands were expelled, local police were disarmed and deported. Ruhr coal was denied to the rest of Germany and eventually the frontier was closed, completely isolating the occupied area.

The extent and nature of these disturbances are obscured by conflicting reports from antagonistic sources.

The first effect of the invasion was a new solidification of Germany. All parties rallied to the support of the government and Berlin declared that no further reparations would be paid till the French and Belgians were again on the Rhine. Poincaré, the Germans insisted, would soon see his error and recall his troops.

In May, however, Chancellor Wilhelm Cuno offered the French an amount approximately one-fourth of the Reparations Commission's award and this was almost instantly refused. Later in the same month England informed the Berlin government that a more satisfactory proposal was essential. This is said to have been done to offset the French contention that English aloofness had stiffened German resistance and encouraged German belief that ultimate evasion was possible.

When, however, Premier Poincaré rejected proposed mediation by the Pope before plans for it were matured and declined to give serious consideration to the German offer to pledge the national railways and other public property of Germany as guaranties and to resume payments to Germany's capacity if the French and Belgians would withdraw, not only Germany but England became alarmed, though for different reasons.

The results in Germany were the collapse of business, the sinking of the German mark to levels hitherto considered impossible, hunger strikes and riots and, in August, the fall of the Cuno ministry.

Dr. Gustav Stresemann, the new Chancellor, opened negotiations with the French but all propositions involving the evacuation of the Ruhr were spurned. Late in September German hopes vanished when, without any assurances from the French, the Berlin government ordered the end of passive resistance.

This confession of defeat precipitated a new condition in Germany. Parties, factions and classes which had stood together in the hope of evading reparations now fell out over who should bear the burdens of payment. Those disagreements are still rife and threaten the destruction of the Fatherland.

Monarchical agitations that smouldered in Bavaria burst into flames when passive resistance was ended. Berlin feared the defection in Bavaria more than any other complication and it is said that the suppression of the communist ministry in Saxony was only a strategem to place a considerable armed force near Munich. That the Bavarian revolt did not rend the Fatherland asunder reflects no credit upon the government at Berlin.

The ridiculous rathskeller revolution in Munich in November, resulting in the inglorious arrest of General Ludendorf and the flight of the leader of the Bavarian "Fascisti," Adolf Hitler, only confirms the statement from a number of sources that the German people have lost initiative as well as hope and want no more fighting.

The return of the German Crown Prince and the rumored return of the former Kaiser naturally gave rise to rumors of a big conspiracy to restore the monarchy, but it will require adroit leadership and skillful propaganda to rouse the Fatherland from its present apathy.

The Corfu Incident

THE fall of the Stresemann ministry in late November further complicated the German chaos and at this writing the most reckless gambler wouldn't hazard a wager on her future.

But the Ruhr occupation has crippled if it hasn't wrecked the Anglo-French Entente Cordiale. France will not soon forget English opposition to her Ruhr policy and English predictions of its failure.

A week before France broke with England and determined upon direct action, Secretary of State Hughes addressed the American Historical Association at New Haven, Connecticut, stating among other things that he believed the restoration of Europe depended upon the rehabilitation of Germany and that though ample reparations should be paid the parties with interests at stake should permit a competent and impartial commission of experts to review the situation and make recommendations. In a speech in Canada in early October Lloyd George recalled the Hughes address and urged joint action upon it with full American participation.

The British Government took up the idea and obtained the consent of all the former Allies to take part in such a movement. Thus invited, President Coolidge approved the plan and Secretary Hughes accepted in behalf of this country.

When, however, plans for procedure were nearing maturity, Premier Poincaré announced that France could not countenance any effort on the part of the experts to modify the findings of the Reparations Commission and that the new tribunal must limit its activities to discovering the amount that Germany could pay "immediately."

In the face of such paralyzing restrictions, the Secretary of State declined to have any further part in so fruitless an endeavor.

Thus the great disagreement stands. A ruined Germany cannot be expected to repair the damages wrought by her troops, and the occupation of the Ruhr has cost France more than she has recovered by it. But has French policy failed? It is doubtful if 1924 will afford the answer, but arguments pro and con can be had wherever men of information gather and discuss the affairs of the day.

The treaty that brought the return of the Turk to Europe not only confirms Turkish control of Eastern Thrace but gives dominion over a number of subject peoples back into the hands of a race noted for the misuse of such power.

The Corfu incident was a spectacular and sensational affair. The commission surveying the northern Albanian frontier was attacked by brigands and several Italians were killed on August 27. Two days later Premier Mussolini dispatched an ultimatum to Athens demanding a staggering indemnity, an abject apology and Italian participation in the apprehension and punishment of the guilty. Twenty-four hours were allowed for complete compliance. The Greek Government disavowed responsibility for the crime but agreed to all Italian demands except those which, she maintained, abridged her sovereignty. Not satisfied with this, an Italian fleet bombarded and occupied the Island of Corfu five days after the crime.

Greece appealed to the League of Nations but Italy refused to accept mediation and threatened to withdraw from the League.

Spain Takes a Dictator

THERE is no doubt that the failure of the League to grapple with this issue has lessened its prestige in many circles.

The Council of Ambassadors then took up the matter and Italy listened. The council decreed that the indemnity should be deposited pending investigation by the Permanent Court of International Justice, that Greece should most formally apologize, that the guilty should be punished and that Italy should evacuate Corfu.

A few days later the indemnity was summarily awarded to Italy without investigation and Corfu was evacuated September 27.

The exaction of approximately ten million dollars from a country in serious economic straits was regarded not as a just penalty but a concession to a dictator thwarted in his effort to further inordinate imperialistic ambitions. The seizure of Corfu could be regarded by England and France as nothing less than Italian determination to utilize the strategically located island to command the Adriatic and, if successful, a part if not all of the Mediterranean. At odds as they were over the Ruhr, complete unity of action by France and England in this crisis was impossible and, as Mussolini could not be expected to retire from his vantage ground empty-handed, the Greek millions made convenient consolation prize.

The sorry plight of Greece has already been mentioned. Greece, it will be recalled, entered the World War under compulsion, her reigning family rather favoring the Central Powers because the wife of the king was the sister of Kaiser Wilhelm. Greece fared well at the Peace Conference and dreamed of a restoration of the ancient Hellenic empire. Encouraged by England she undertook her disastrous campaign against the Turks in Asia Minor.

Defeat abroad brought revolution at home and for a second time King Constantine was banished. The ministers who urged the war were tried and six executed in November, 1922. On November 12 of this year King George agreed to take a vacation of at least two months to give the political situation a chance to right itself, if possible.

The troubles of Spain have so far been internal and colonial without conflict with any other European country. When Kaiser Wilhelm forced the Moroccan Conference at Algeciras he failed to obtain for Germany a direct hand in Morocco, but he checked the French by bringing about the association of Spain with that country in the administration of that turbulent realm.

This participation has brought Spain more trouble than gain or glory. The African tribesmen first evaded, then defied and finally defeated the Spanish armies.

Socialist agitations at home grew with reverses in Morocco. Syndicalist strikes in the larger cities were serious but they did not threaten the stability of the government.

The Province of Catalonia, with Barcelona as the capital, had long sought an autonomous government but this controversy was a minor issue in the recent disturbance.

On August 20 the Spanish army met a reverse in Morocco and escaped annihilation only by the timely arrival of re-enforcements. Even with numerical superiority, the Spanish seemed unable to hold their own and the Moorish chieftain then ordered all his reserves to join his ranks. Premier Alhucemas and his cabinet appeared to be unable to meet the situation.

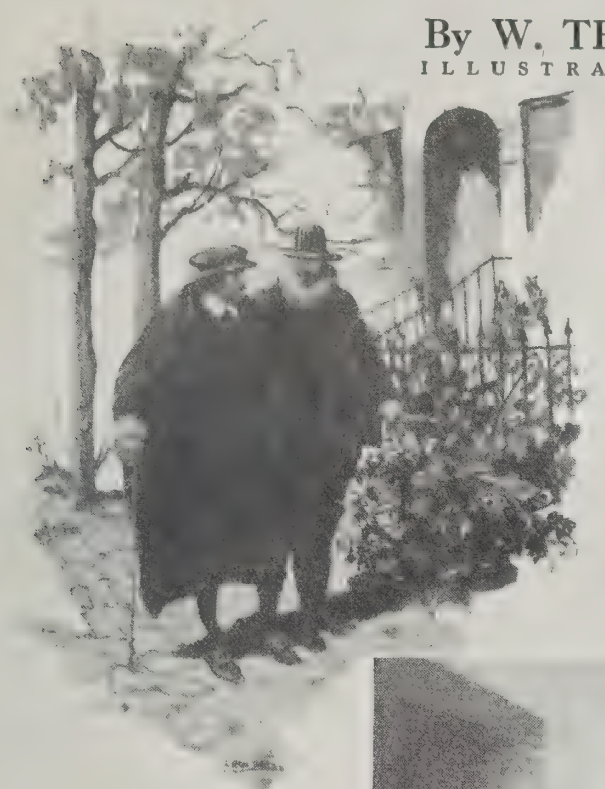
At this juncture a group of army officers headed by Ferdinando Rivera, general in command at Barcelona, sent a demand to Madrid on September 12 that the Moroccan campaign be vigorously speeded up. The next day he took possession of Barcelona and the revolt spread. It followed the general lines of the Mussolini rising in Italy last year. The premier demanded of King Alphonso the right and the wherewithal to punish the rebels, but the king refused and the premier and his cabinet resigned. The army at Madrid joined Rivera's

(Concluded on page 14)

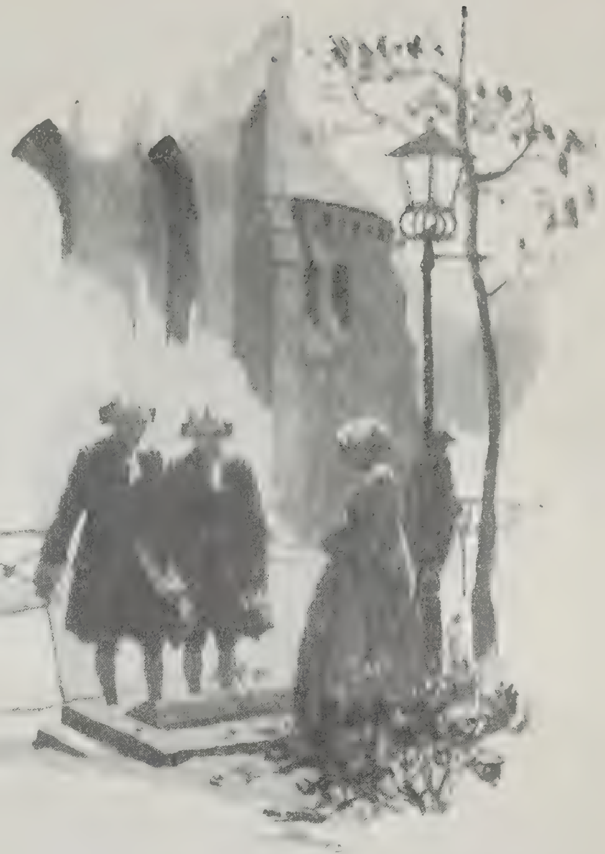
Adventuring With Ghosts of the London of Romance

By W. TEIGNMOUTH SHORE

ILLUSTRATED BY L. PERN BIRD



The shade of William Shakespeare, accompanied by the burly figure of a player friend, appeared in Temple Garden.



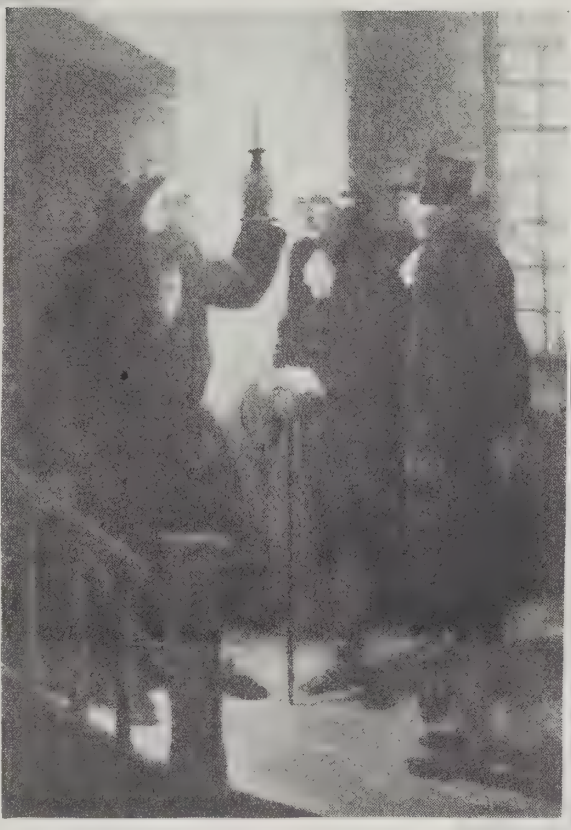
Other ghosts appeared beside the humble stone that marks the burial place of Goldsmith. The woman, whose face could not be seen, must be the Jessamy Bride.

CAN there be a more pleasing adventure, for one who is a lover of the London of yesterday and of the days before, than to spend some hours of an evening communing with the ghosts that haunt the highways and byways of the gray metropolis? There are ghosts in myriads for those who have eyes to see them: frequenting those places in which they spent their earthly days and for the most part shunning the more modern quarters of the town. Shadows love a shadowy land. They are fond of shy neighborhoods, and of these one of their most favored spots is the Temple, the home years ago of the Knights Templars and still the abode of their successors, the Men of the Law, who here receive their training and pursue their calling. But there are others who have dwelt in this ancient home of peace, for the most part men of letters, who found the silence there agreeable to their habits. Of some of those who live there now it is my good fortune to be a friend; many a delightful evening have I passed in their chambers. Then I have gone home through the quiet courts and passages, gloomy with the wintry mists or gray in the moonlight; and so out into the midnight city. Often have I loitered, turning aside from my direct way, seeking out those spots that are frequented by the spirits of the past: a wondrous company, and kindly to those who meet them in good fellowship and understanding.

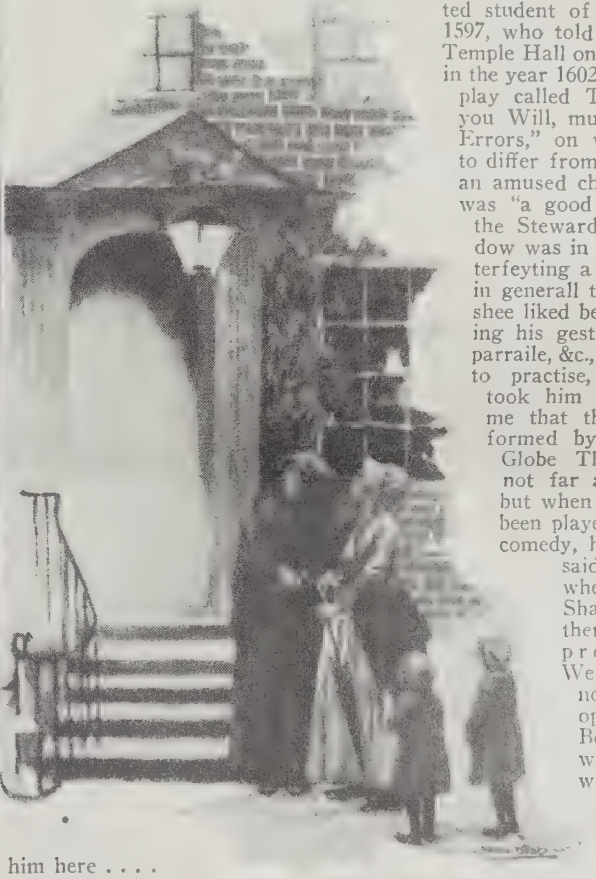
I remember one night in particular: I went from King's Bench Walk past the round Church of the Templars and so into Inner Temple Lane. The summer moon shone bright through the misty air and all was still save for the muffled roar of the city traffic. I turned aside to the little flagged graveyard beneath the stones of which lies all that is mortal of Oliver Goldsmith. A very humble stone marks the whereabouts of his burial place. As I stood there musing, it seemed to me that I was not alone: dim figures were beside me, the burly Doctor Johnson, who loved Goldy more than ever I think he allowed him to know; Sir Joshua, who did not hide his affection; Davy Garrick, Edmund Burke and many another whose name echoes down the corridors of time. They passed, mourning, and others filled their place, nameless women of the town, unknown scribblers, other poor and humble folk, whose distresses he had ungrudgingly relieved and with whose sorrows he had sympathized. They too passed, and a woman whose face I could not see beneath her hood drew near; I knew that she was the Jessamy Bride, the beautiful, dainty Mary Horneck, whom Goldy loved and who treasured to her dying day a lock of his hair.

There are other spots in the Temple haunted by the spirit of Goldsmith, and it pleases me most to meet him in his chambers in number two Brick Court, "two pair right," the lease of which he purchased in 1787 with the money gained by "The Good-natured Man." It should be remembered that the austere Blackstone, he of the Commentaries, occupied the rooms below those of the poet, and he bitterly complained of the disturbance caused to him in his work by the gay doings of Goldy and his noisy friends. If at the right hour you will loiter by the entrance to the dark staircase of number two, you will see many a famous shade pass by to visit Doctor Oliver Goldsmith. Here he was attended in his last hours by kindly Doctor Turton, who said to his restless patient, "Your pulse is in greater disorder than it should be, from the degree of fever which you have. Is your mind at ease?" To which Goldsmith made the reply: "No, it is not." What was it that troubled him? Most probably some thought for another. At a quarter to five in the morning of Monday, April the fourth, in the year 1774 and in the forty-sixth year of his age, he crossed the bourne from which no traveler returns.

The shade of Boswell I have always avoided, guzzling, bibulous, jealous little man. Goldsmith he never understood and he licked the boots of the brusque doctor, apparently finding the blacking very much to his taste. Bozzy lived for a time at the bottom of Inner Temple Lane, so as to be near his patron who had rooms at number one, now gone the way that all the buildings of man's hand must go; the site being occupied by the unpicturesque Doctor Johnson's Buildings. The ponderous doctor could unbend upon occasion, and it is at such a time that it is best to meet with him here . . . . It is three o'clock in the morning when two gay young blades come thundering at the door, Bennet Langton, gentleman of ancient Lincolnshire family, tall, slight, stooping, with mild expression on his elegant features and a gentle smile. With him Topham Beauclerk, light-hearted libertine and man of taste. These two fast friends had been supping at a tavern in the town and were ready for more fun. At last, in response to the violent assault upon the panels of his door, the doctor appears, in his hand a poker which he brandishes threateningly at the disturbers of his peace. But, recognizing friends, he roars in high good humor: "What, is it you, you dogs? I'll have a frisk with you." So the three sally forth to Covent Garden, where the fruiterers give them a cool welcome, being busy and having no use for such wild roisterers. Then to a neighboring tavern, where they indulged in a bowl of *Bishop*—a potent, hot liquor, compounded of port wine, cloves and oranges. Then back to the riverside, where they take boat to continue their explorations and where we will bid them farewell. In Pump Court is an ancient sundial, set up in the year 1686, whereon is the motto: "Shadows we are and like shadows depart." It has aroused in my mind the thought that perchance in the years to come I may return to haunt these gray courts and alleys: I hope it may be so. This date carries us back to within earshot of the days of Master William Shakespeare, poet, maker of plays, theatrical manager and good fellow. More than once I have met his comely shadow here, but I did not accost him with "Alas! poor ghost." With him on one occasion were his fellows, Francis Beaumont and John Ford, also makers of plays, both students of the Temple, nominally at any rate. Also Sir Walter Raleigh, and Sir Francis Drake who in 1586 shortly after his return from his voyage round the world in the *Golden Hind* was entertained by the Templars who then, as now, were notable hosts.



Dr. Johnson, poker in hand, responds to the assault upon his door at the unearthly hour of three.



Pretty, nervous, fanciful Fanny Bolton and her mother stood under the lamp, gazing up to the third floor of the house where Pendennis' chambers were.

And I have consorted with the shade of Master John Manningham, admitted student of the Middle Temple in 1597, who told me that in the Middle Temple Hall on the second of February in the year 1602 "at our feast wee had a play called Twelve Night or What you Will, much like the Comedy of Errors," on which point I ventured to differ from him. He went on with an amused chuckle to tell me that it was "a good practice in it to make the Steward beleeve his Lady widdow was in love with him, by counterfeyting a lettre as from his lady in generall termes, telling him what shee liked best in him and prescribing his gesture in smiling, his apparraile, &c., and then when he came to practise, making believe they took him to be mad." He told me that the play had been performed by the actors from the Globe Theater upon Bankside, not far away across the river, but when I asked what part had been played by the writer of the comedy, he shook his head and said that he had not noted whether or not Master Shakespeare had been there that night. I expressed disappointment. We of today may visit that noble Hall, which was opened in 1576 by Queen Bess herself. And could we be there in the dim watches of the night who knows but that we might witness a comedy played by ghostly actors?

Another witty writer of comedies of a later day, but still far away from us, had chambers in the Temple: handsome, wicked William Wycherley. The story goes that Barbara Villiers, Duchess of Cleveland and mistress of Charles II, was enamored of the good-looking playwright, who was a fine figure of a man, and that she was wont to visit him there, disguised as a country wench, in straw hat, wearing pattens and carrying a basket on her arm. When I met the shadow of the gay gallant one dusky night, I was indiscreet enough to question him upon the truth of this tale. Whereupon he preened himself, made an effort to appear unconscious, shook his head, and replied that a gentleman was tongue-tied in regard to all such adventures.

As elsewhere and everywhere, life in the Temple is a mingling of tragedy and comedy with flashes of farce. The ghosts of murderers and suicides lurk pale-faced behind discreet windows here which for the major part at nighttime look down blankly and darkling upon the wayfarer in this shadowy London backwater.

William Cowper had chambers in the Inner Temple, dwelling there for some years, making but scant progress in the study of law. His mind grew clouded with despondency and with what might almost be called fear of himself. One evening in the year 1763, a November night, with as innocent mien as he could assume he purchased of an apothecary a half-ounce of laudanum. He walked out into the country, which then drew far closer to the Temple than it now does, but when he had gained the fields his purpose changed and, returning to his chambers, he decided to seek harborage abroad. Again

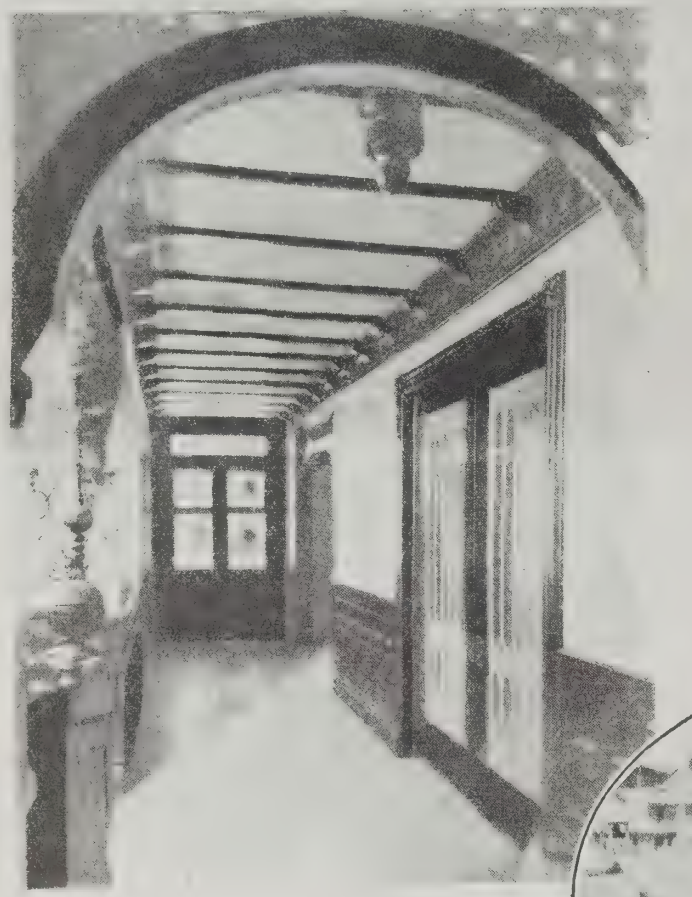
"Spirit House"—World's Largest Home—Is Open

Most Complicated Residence, Never Completed, Built Over Period of 38 years at Cost of Millions

By JOHN L. VON BLON

Photos copyrighted by C. C. Pierce & Co., Los Angeles, 1923.



The magnificent front hall, in prisms, gold and silver, and the massive door with entrancing art-glass panels. The tragedy of this grand portal is that it swung open but three times during its thirty-eight years' service—for the entry and exit of the late Mary Baker G. Eddy and latterly for the silent form of the mistress to be borne forth.

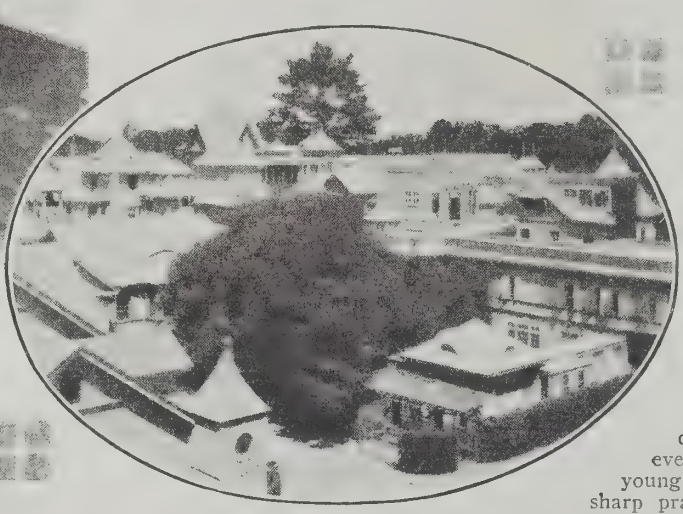
CALIFORNIA'S famous "Spirit House" near San Jose, perhaps the world's largest, most complicated, sumptuous and exclusive private residence, has been opened to the curious public; and after a generation of mystified waiting they that enter find—more mystery! It is a colossal patchwork mansion of 144 rooms builded and occupied during a period of thirty-eight years by the late Mrs. Sarah L. Winchester but not finished because a ghost directed otherwise! The cost is estimated as high as $5,000,000. For the materials alone, the choicest obtainable, the outlay was well over $1,000,000. There was no stint to the almost unlimited funds in the coffers.

This vast, complex edifice, reared upon the compelling fantasies of an aged, wealthy recluse whose noble charities will make her memory ever beloved, and representing in truth a stranger blend of romance and philosophy than fiction tells, contains more than 2,000 doors, fully 10,000 windows, and 150,000 panes of glass! Similar proportion, or disproportion, prevails throughout in other respects.

Every week day in all the thirty-eight years a corps of sixteen or more carpenters and artisans was employed, fabricating, wrecking and reconstructing. The rasping of saws and the crash and clatter of hammers and other tools resounded everywhere in the awkward, ambling and grotesque, yet magnificent, conception as it expanded. Frequently, it is related, half a dozen of them made all the noise they could while the others entertained themselves at cards in obscure recesses. And the owner, though by no means a materialist, felt a keen gratification the while the substantial pile assumed queer shape and enormous size.

Mrs. Winchester, who died a number of months since, was the relict of the son of the founder of the firearms concern that bears the family name. Widowed forty years ago and soon after bereaved of her only child, she decided in her grief to leave forever her home in New Haven, Connecticut; first, however, establishing there the Winchester Sanatorium for tubercular sufferers and providing generously for its support. An ardent Spiritualist, she regarded some of Nature's manifestations as supernatural and is said for this reason to have been so terrified by New England thunder and lightning that it influenced her purpose to seek another clime. Possessed of the Winchester fortune and the recipient of royalties of $1,000 a day, she traveled until she found what appealed as the ideal location, which happened to be San Jose.

On Stevens Creek Road, four miles from the then little town, Dr. Caldwell was completing for himself a seventeen-room home on a thirty-acre lot. This Mrs. Winchester bought, retaining the construction force to consummate the job. Then, so the story goes, a medium conveyed to her from a friendly source in the unseen realm the tidings that death never would overtake her while the dwelling was kept in the process of making, whereas completion and cessation of operations would be fatal. Here appeared hope akin to life indefinite as against dissolution and it was seized upon. In the light of subsequent developments there is a suspicion that the medium may have relayed the "message" of an enterprising contractor.



The "Spirit House" near San Jose, California, a mystery mansion of 144 rooms and costing millions, is now open for the first time. It was built and rebuilt for thirty-eight years by the late Mrs. Sarah L. Winchester. A spirit directed her to keep up construction but not to complete the residence, and it is a colossal but most luxuriant patchwork. This is a rear view, because trees preclude a photograph from front.

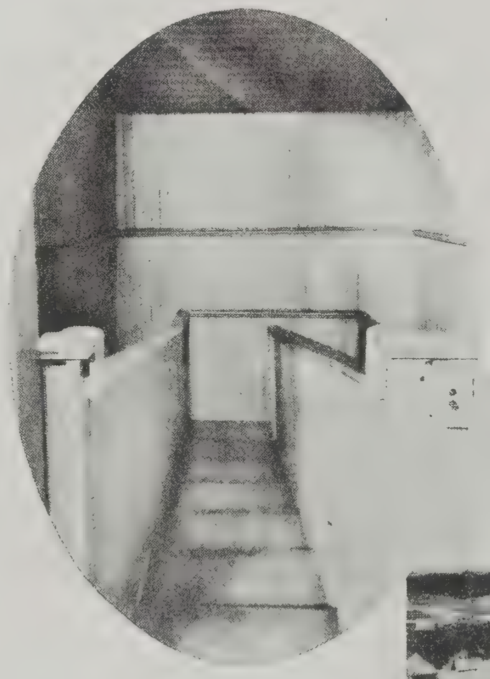
Speedily ensued surprising alterations. The architect saw that all his careful plans were for naught and quit in disgust when the lines were distorted. The head carpenter refused to tear down work he had painstakingly done and was discharged. So there were many changes and increases in personnel. Mrs. Winchester calmly became the sole designer and so remained. Gradually she evolved something that makes the "House of Seven Gables" look like a doll's box—for it has seven score of them; and makes the weirdness of the legendary midnight "House of Usher" seem a baby's joke by contrast.

Meantime the neighbors became interested; also inquisitive, as is the wont in small communities. One of the leading society dames went to make a formal call. A servant returned her card with the word that Mrs. Winchester did not wish to meet her or any others thereabouts and would thank them all to mind their own business and leave her alone. In the seclusion she craved she seldom was disturbed after that; but when the late President Roosevelt visited the valley twenty years ago the San Jose Chamber of Commerce, doing the honors, desired as a special favor to have him shown through what some termed the "manse of the spooks" that he might behold its wonders. Every effort was made to induce its mistress to receive the Chief Executive; the decree was that he could not cross her threshold, and Mr. Roosevelt laughed heartily when he heard of it. A queen could not have spoken with more haughtiness or finality.

As the crazy-quilt domicile's magnitude spread over the original grounds and it took on the aspect of a city, lands were added until the estate comprised an extensive acreage. Space to preclude disturbance of the eccentric occupant's peace of mind was insisted upon. Neighbors annoyed her with revelry one night and the next morning she ordered the purchase of their property at any price. Sensing an opportunity to make money through Mrs. Winchester's determination to exclude everything objectionable, a smart young realty dealer readily profited by sharp practice. He informed one of her trusted servants that the owner of a large tract opposite "Spirit House" contemplated erecting a roadside inn. As he had anticipated, the agent immediately sold her the land for a fabulous sum.

Tall trees, dense hedges and an unscalable fence surround the beautiful parks and flower gardens that form the setting of the marvelous habitation now silent as a tomb and effectually shield it from outside view; but it has lately been purchased for exhibition purposes, the grim iron gates at the gray-graveled entrance are ajar, and we will inspect, as briefly as possible, the most bizarre maze ever assembled by human hands. To examine it all would require months; to describe it, a large volume. Spending a minute in each room would involve almost two and a half hours. Exploration has only been begun. Each day reveals unsuspected features.

There are miles of corridors, winding, intricate, bewildering. To enter alone and walk fifty feet in any direction endangers a stranger becoming so completely lost that real fright will result and a search may have to be instituted. Even the guides find it necessary to have arrows painted on the floors to indicate the way to go and prevent long wanderings. Of the 144 rooms not a dozen are on the same level, so we pass up and down continually, usually a short distance but many steps. There are hundreds of "goofy stairs"—steps two and a half inches high, eighteen-inch tread, and narrow casings. In one place forty-five of these are negotiated to make a



There are many narrow staircases of the finest polished woods. In this the steps are two and one-half inches high and the tread eighteen inches. There are nine turns back and forth in a rise of eight and a half feet.

A bell tower and roof from a fourth-story window.

A frequented entranceway, showing an uncompleted portion of the house.

rise of eight and a half feet, and there are nine turns back and forth. In another, eighteen steps and five turns to reach a room four feet below. Many hallways are two to three feet wide and the stairs not over eighteen inches. Like all else of woods, these are of the finest that grow, not veneer but solid, and piano-top finish. There are tens of thousands of square feet of polished surface, not to mention the floors, that reflect like a mirror.

It is a phantasmagoria of chambers. There is no adherence to design and it is all a gigantic puzzle, yet artistic. Futuristic and cubistic are words that apply to the wild medley of beauty unbelievable, lavish, gorgeous, amazing. There are windows of every size and form—in the walls, the floors, the ceilings and the chimneys, hundreds against blank partitions or solid exteriors—costly art glass in a dazzling conglomeration, but sunny days bring only twilight within. Handsome doors open inward and out at countless unexpected places, some in the upper stories directly to the outdoors and a sudden fall. Like the windows, the doors may lead to a roof beneath a false floor or a closet so tiny that if a book were placed inside they could not be closed. We open a gold-plated screen framed in richest mahogany and find behind it an elegant bird's-eye maple and art-glass door; back of that—the wall. Opening another heavy door we go up a metal-bound flight of stairs fifteen inches, turn, and find another flight leading into the room we have just left. A door with a six-inch threshold of Carrara marble is the entry to a short passage with no outlet—a "blind." And more and more doors are discovered. What a field 'twould be for Sherlock Holmes!

One of the numerous doors concealing gongs electrically connected by scores or hundreds of wires.

Turning to a few of the hundred more extraordinary rooms we come to the "white satin chamber," so-called because the walls and ceilings were effectively draped with that material and even the floor covered with it. This satiny bower of snowy whiteness held central interest during the owner's lifetime because here she held communion with her departed mate. No other person entered. In her declining years Mrs. Winchester often was taken up or down on one of the three elevators that lead from basement to garret, wheeled to the door in her chair, and her nurse dismissed. Then she would enter and remain in the room possibly for hours, and ring for the attendant when ready to leave. Invariably she was found outside and the door locked. Quite unlike most other rooms, this had but a single window, always closely curtained. Sometimes from without the shadow of a woman's form was seen passing this window, but prying eyes never glimpsed what transpired within.

Particularly significant to her also was the "blue room" or seance chamber, entered by a plain door and zealously guarded against intrusion. Two small windows to inclosed skylights are steel-barred. Noteworthy here is a capacious closet in which were kept numerous wondrously colored silk and satin gowns each having, by virtue of its hue, a specific relationship to a spirit guide and being worn when that one's counsel was sought. On the farther side is a wardrobe with drawers beneath. Step over these and you are in a labyrinth of unfinished rooms affording access to many parts of the house; a secret way.

"Prism hall" is the superb main entranceway, ten by forty feet and a masterpiece executed in silver and gold and thousands of prisms, the latter so set that they make the length of the hall a glory of scintillating brilliance—all the colors of the rainbow. The massive front door, with its entrancing art-glass panels, is worth as much as a common home. The tragedy of this lovely portal is that it swung open but thrice during its thirty-eight years' service—for the entry and exit of the late Mary Baker G. Eddy, schoolmate and dear friend of Mrs. Winchester, and for the still form of the mistress to be borne out when death would not be stayed. Mrs. Winchester, her closest employes and the few others who were admitted, entered the house by an uncomfortable side stairway and used a mediocre reception room, barren and foreign to any hint of luxury—a dingy place wherein the extremely wealthy gentlewoman greeted any she welcomed.

Off the grand hall is the dining and ballroom, in which no ball ever was held; twenty by forty feet and a dream in exquisitely carved bird's-eye maple. What look like cobwebs on the ceiling, holding the daisy patterns that make up its panels, are intricate gravings by a famous artist. Gold and silver leaf in glowing tints decorates the walls. As elsewhere in the house the fixtures are heavily plated with gold and silver and all the windows and doors "leaded" with German silver inside and bronze to the weather. In the upper part is the most elegant of art glass and beveled French in the lower. Two stained-glass windows bear the mottoes which, joined, read: "Wide unclasp the tables of their thoughts; these same thoughts people this little world." There is a great pipe organ, and fireproof vaults and burglar-proof safes to hold the treasure in gold and silver plate. The contractor who agreed to finish this room for $9,000 lost $400 because it cost him that much additional.

Another hundred apartments might be detailed, from the luxurious living room to the severely simple chamber in which Mrs. Winchester surrendered to the inevitable amid the clangor of construction she directed to the very last hour. Each has a peculiar touch of individuality, the mystic impress of the indomitable planner firmly placed. The most uncanny part of the whole is the section first put up, which was rocked and shattered by an earthquake in 1906. The damage was done, Mrs. Winchester insisted, by spirits because they desired her to abandon that part. She left the furnishings just as the "spirits" had disposed them, never entered again, and commanded the servants to padlock it and stay out. The extravagant embossed plastering hangs from the ceilings and walls in shreds, the expensive beveled windows are broken, and an inch of dust covers the rare inlaid woods of the floors and railings. It is a melancholy picture of destruction. The hobgoblins were in ugly mood.

Balconies constitute a perplexing peculiarity of the spectral home. They are many and large and the product of expert cabinetmakers, but usually on level floors, in the centers of rooms, at the heads of "goofy stairs," all over the place, serving no apparent purpose. In most instances they are in pairs or groups of several, each entirely inclosed.

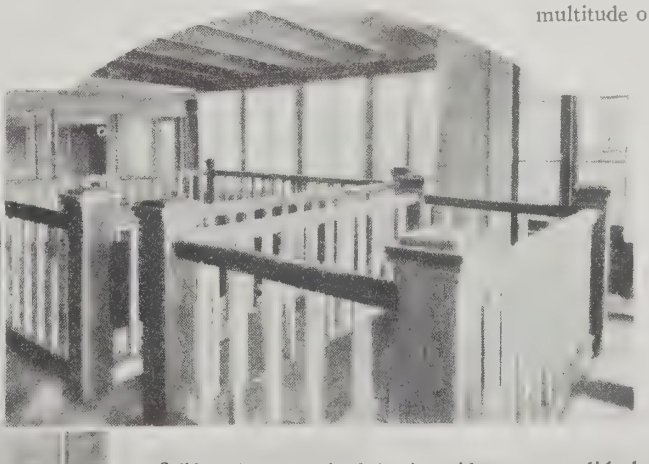
Three means of lighting and six systems of heating are provided for the mansion—wood, coal and gas fireplaces and steam, hot-air and electric radiators. Forty-seven mantels have been counted, of brick, tile, stone, marble, wood, brass and even glass. There are four mantels and fireplaces and five hot-air radiators within an open space ten by twenty-five feet.

One big bathroom is conspicuous because in its very center stands an old-fashioned zinc tub. There are twenty-four other bathrooms with tiled and mosaic floors and side walls, ornamental ceilings, and elaborate cut-glass windows. These contain the best of modern tubs and fixtures, silver-trimmed. They are not connected with sleeping rooms but scattered hit or miss. So with closets visible and concealed, numbering hundreds if not thousands, countless chests of drawers, and close-fitting minor compartments, nooks and crannies yet beyond estimating; kitchen after kitchen with every conceivable convenience and shiny with nickel, porcelain and marble; and sinks by the hundred, all with faucets and running water, together with fire-fighting facilities. These sinks are encountered in odd places, even to stairways.

Electric push buttons dot the interior. A multitude of them is concealed. Doors hide gongs connected with myriad wires that have not been traced. Nobody living knows what all these buttons and gongs and switches are for. They form an electrical network so confusing that it may never be understood.

Despite her aloofness and eccentricities Mrs. Winchester was a woman of charm, cultured, educated, fluent in several languages, a lover of music, art and literature, and philanthropic on a large scale. She found happiness and satisfaction in her hermitic existence, a life of icy, regal splendor and lonely, oft pathetic, grandeur. During her long career in "Spirit House" she never visited another home, never entered a church or public building nor did she ride upon a train.

That she had faith in the message of life so long as she builded is shown by the fact that she left sufficient materials to have prosecuted the unique task forty or fifty years longer, and continued buying. It fills three large storehouses and includes astounding quantities of the superexcellent stock she used, some of which it would be almost impossible to purchase today.



Solid mahogany twin balconies without purpose or significance.

Four mantels and fireplaces and five hot-air heaters in a space 10 x 25 feet. Arrows point to mantels.

Bankers Nullify Torrens Land Title Law

Money Merchants Hold Up People for High Fees Despite Low-fee Statute

THE TORRENS ACT

The person or persons in whom singly or collectively the fee-simple is vested, either at law or in equity, may apply to have the land placed on the register of titles. The applications are submitted for examination to a barrister and to a conveyancer, who are styled "examiners of titles." These gentlemen report to the register:

First, whether the description of the land is definite and clear;

Second, whether the applicant is or is not in undisputed possession;

Third, whether the applicant appears in equity and justice rightfully entitled to the land;

Fourth, whether the applicant produces such evidence of title as leads to the conclusion that no other person is in position to succeed against him in action for ejectment.

These questions being answered affirmatively, a certificate is issued describing the nature of the real estate of the applicant, and this certificate of title vests the estate indefinitely in the applicant. This certificate of title is kept in duplicate by the registrar, and the putting together of these duplicates constitutes the register.

By ROBERT MORGAN

WHEN I was a boy in a country grammar school in the then new West, we initiated newcomers at the school into our "secret society" by compelling them to slide off the roof of the barn in which we stabled our riding horses, while we pelted the unfortunate aspirants for social honors with green walnuts. There was a law of the school against this sort of treatment of new pupils, but the principal of the school was a small man, of rather troubled mind and somewhat uncertain courage. If he punished one, he had to punish all, and he was totally unequal to the task, so the law went unenforced.

Newcomers to California—where, by the way, that school was and still is—are initiated into property ownership by payment to the banks, and to the title, guarantee and trust companies, which are subsidiaries of the banks, of fees from five to twenty times as large as the state law says they need to pay. But the state law is not powerful enough to compel the bankers and the title companies, or even some of the more opulent real estate dealers—"realtors," they call them out our way—to give the new property owner a square deal.

To me there is a suitable comparison between the school-day rule-breaking of thirty years ago, and the money merchants' law-evasion of today. There is, however, this difference: Whereas we boys merely broke a rule, and harmed no one beyond a few black-and-blue spots, the bankers and the title, guarantee and trust companies, and some of the real estate dealers, of California, are taking from the pockets of every man or woman who buys real estate there, money to which none of the three is entitled, and for which no adequate service is rendered. The "searching of titles" for which the land or home buyer pays the title company, is the sheerest pretense, to be gone through with, for an exorbitant fee, every time the property changes hands. The "insurance of title," likewise to be paid for every time a farm or a lot or a home is sold, again is taking money under false pretenses, for the records show that less than one-twenty-fifth of one per cent of the real property honestly sold is ever subject to legal action as result of defective or insufficient title.

Yet there is, on the books of California as part of the active law, the "Judicial System of Registering Titles"—in other words, the Torrens Land Law, modified to meet conditions in a country in which, owing to the mandate of the written constitution, registration of title must be judicial, the result of judicial authentication. California and Illinois adopted this law in 1897, the first of the states to put it on the books. Massachusetts followed in 1898; Oregon and Minnesota in 1901; Colorado in 1903; Washington in 1907; New York in 1908; North Carolina in 1913; Ohio in 1914; Mississippi and Nebraska in 1915; South Carolina and Virginia in 1916, and Georgia, Utah, North and South Dakota and Tennessee in 1917. In some states it is the exclusive law on land titles and their registration; in others it divides authority with the old system of registration of deeds and passage of titles through the title, guarantee and trust companies. In none of these states, except California, have the money powers been able to nullify the law, while it stands on the statutes, to such an extent that the private title companies are able to *forbid the property owner to use this method of registering and transferring his title.*

That is exactly what the title, guarantee and trust companies of California, backed financially by the banks, and supported by the attorneys, and the real estate agents and dealers, have done. In mortgage blanks provided by title guarantee companies, the man who mortgages his land or his home is compelled to sign away all right to the use of the economical, safe and expedient Torrens Land Law. In these mortgages, just above the name of the mortgagor, appears the following paragraph:

> "In consideration of the funds obtained, secured by this mortgage, the Mortgagors hereby waive the right to have said premises registered under the 'Land Title Law,' an act approved by the electors of California, and in effect December 19, 1914, and agree that during the life of this mortgage no application shall be made therefor and this agreement shall be binding upon all subsequent owners of said premises."

In consideration of the funds obtained, secured by this mortgage, the Mortgagors hereby waive the right to have said premises registered under the "Land Title Law " an act approved by the electors of California, and in effect December 19, 1914, and agree that during the life of this mortgage no application shall be made therefore and this agreement shall be binding upon all subsequent owners o said premises.

Witness the hand........ and seal........ id Mortgagor........ the day and year first above written.

ned and sealed in th ....(SEAL)

How the mortgagor in California is compelled to surrender to the money barons.

Now, the title guarantee company prevents the use of the Torrens Land Law, not because it doubts its accuracy, or safety, but because such registration of the property or properties mortgaged would deprive the title guarantee company of fees ranging from approximately fifty dollars for the small property, up to thousands of dollars for large business-district holdings in any city. Just why the owners of real estate in California, particularly homes and farms, should submit to this robbery through nullification of the law becomes apparent when it is realized that, in the case of mortgages, unless the mortgagor agrees to abandon his legal rights, and pay the exorbitant fee of the title company, he will not get his loan. The writer has known three men to whom this "corrective treatment" was applied when they refused to sign mortgages forbidding them to make use of the Torrens system. Each was informed by the representative of the title guarantee company that no loan would be forthcoming unless the mortgagor abandoned his legal right along this line. The men still refused to sign, and found, after a week's search, that they could not borrow a dollar from any bank, trust company, title guarantee corporation, or even private money lender, without pledging themselves to pay the required tribute—for which they receive no return which could not be had under the Torrens Law—to the title guarantee company.

The advantage of the "Judicial System of Registering Titles," lies in the fact that it is a registration of *title* and not merely of *deed*. This advantage is fivefold: it eliminates all contest for the title, it guarantees possession, it is simple and easily understood, it removes the necessity for the searching of titles, the largely mythical proceeding from which the title companies glean such large profits; and it reduces the cost of land transfers to an average of less than ten per cent of present costs. Experts on land titles and their transfer agree that the greatest of these advantages is simplicity of registration. A certificate is issued at the first registration, describing the nature of the real estate, and this certificate of title vests the estate indefinitely in the applicant. The certificate is kept in duplicate by the registrar, and the putting together of the duplicates, and their comparison, constitutes the register. The title is fully protected against adverse claims, and if, after the certificate has been issued, proof is adduced that the registered owner is not entitled to registration, the rightful owner cannot recover his land. He is, however, guaranteed compensation from a fund formed by the contribution—in Australia, where the law has been in operation successfully since 1857—of one-half penny to the pound sterling, or about one-fifth of one per cent, value of the land, levied when registration is made.

Sale (transfer) of the land merely requires cancellation of the old certificate of title, and the issuance of a new one. All the old transactions are wiped off the map, and the holder of the new certificate is the new owner, with the same protection that the first owner had. These operations demand little time, little expense, and eliminate completely the long legal processes through which the vendor and the buyer of real estate have to work their way under the system the money merchants have forced upon us. Mortgages or leases are entered on the certificates, and all charges against the real estate are shown at a glance at the certificate. When a new certificate is issued to a new owner, all the undischarged charges appear on it, and on its duplicate which is a component part of the state and county and city register of lands. No method yet devised keeps so perfect a record of every acre of land in any subdivision of a country as does this.

In Australia, the charges are an application fee of five shillings, and a registration fee of one pound, when the certificate is issued. Subsequent issues of new certificates to new owners, recording of mortgages on the certificates, and so on, cost from five shillings to one pound. In California, the certificate of title, with one duplicate, costs $1.50; each further duplicate, fifty cents, and each transfer registration and issue of new certificate to a new owner, $1.50. These charges compare with total costs of approximately thirty-two dollars for the so-called "searching of title," "insuring of title," registration of deed, and so on, for a small property valued at from $3,000 to $5,000. Beyond $5,000—the price of a very modest home—this figure soars rapidly into thousands of dollars for business property of high valuation. The title guarantee and trust companies mulct the purchaser in proportion to the amount of money he is investing, while, under the Torrens Land Law, and its American prototypes, the charges are fixed, and the same for all values. Small wonder the lawyers, the title guarantee companies, the banks and the real estate dealers support the present antiquated, involved, costly and usurious system in preference to the Torrens Law!

These factions are enabled to make their opposition to the simpler law felt because the bankers and title guarantee companies were clever enough, when the "Judicial System of Registering Titles" was adopted in California, to see to it that the statute was not made mandatory, but merely optional with the buyer of property. That is to say, if the purchaser of real estate in California wishes to register his title under the Torrens system, he may do so. He will be perfectly protected in his title by all the authority of the state, but he will not be able to borrow money on his own property unless he pays tribute to the title guarantee companies, which in turn are owned by, or closely involved with, the banks. Attorneys support the demands of the title guarantee companies and the banks, because they draw fat retainers and large fees from both for giving their "opinions" on legal questions, a barrage of which is raised over every possible title. Under the Torrens system, these "opinions" are as needless as the "searching of titles," or the insurance of them, and the attorneys would be out hundreds of thousands of dollars yearly, in California alone, if the Torrens title system were made mandatory instead of optional.

The real estate dealers support the position of the title guarantee companies, the banks and the lawyers, because they cannot borrow money on subdivision projects, for the development of tracts of land near cities, and for the "swinging" of large and frequently uncalled-for deals in real estate, without the assistance of the banks. Thus it goes, an endless web, spun by the traffickers in money, to entangle the purses of the would-be home-owners, the farmers, and all who wish to hold title to a piece of the earth.

As examples of the successful operation of this system of registration and guarantee of land titles, and transferring them quickly and cheaply, it should be mentioned that, beginning with the adoption of the plan, fresh from the hands of Sir Robert Richard Torrens, by Australia, in 1857, British Honduras adopted it in 1858; Queensland, Tasmania and Victoria in 1861; New South Wales in 1862; New Zealand in 1870; West Australia in 1874; Fiji in 1876; England in 1897, and that now all the British insular possessions have it in operation. The elimination of retrospective examinations becomes automatic under the Torrens Land Law. That is to say, the "searching of titles" is removed because there are no back titles to search. The title in hand is the only title, the only one registered and the only one which can be transferred. In other words, the state gives an unassailable certificate of ownership and transferability. The registered owner who sells a piece of property executes a deed to the transferee, and the deed is filed in the registrar's office. The owner then surrenders to the registrar his certificate of title, which is canceled, and the issuance of a new certificate by the registrar to the new owner completes the transaction. This requires possibly two hours' time The cost is a maximum of five to six dollars for property of any size or value, compared with thirty to fifty dollars for the first $5,000 of value and five dollars for each additional $1,000 of value, under the system maintained in defiance of the optional law by the money dealers of California.

Mr. Ford's Page

THERE is no possible difference of opinion about the fact that the center of the world's prosperity during recent years has been the United States. Neither is there any special difficulty in accounting for the fact. It has not been due to superior statesmanship nor intrigue; it is not the fruit of compulsion exercised by us on the nations; it is due to one reason alone, namely, that we are in the position to serve the world and the world has availed itself of our service.

How long will it last? is a question which has occupied many minds in recent months. There are always those who feel that a good condition is too good to be true, or too good to last. As winter came on a year ago there were voices that prophesied a serious slow-up. As the present winter came in sight, the forecasts of gloom were noticeably fewer. And yet serious men are not content to lose sight of the possibilities, nor to indulge so far in thoughtless optimism as to forget that after all eternal vigilance is the price of economic as of every other kind of security.

If all the factors were in our hands, that is, if the directing influences were all visible and open to our control, there would seldom be any difficulty in forecasting economic conditions. Given the daily needs of the people, the labor required to supply those needs, the interchange of wealth between field and factory and merchant and worker, and it is not at all difficult to say that business can always be good provided it is not tampered with, provided the desire of all the elements of business is toward prosperity by work instead of by trick.

Very seldom do natural causes, that is, the natural and unpreventable economic inability of the people, account for periods of unproductiveness and want. Very seldom. Most of such periods are artificially induced. Someone who wants to get rich out of turn; someone who wants to turn playboy and jam up the economic machinery; someone who wants to make a quick "killing" and "retire"; some stupid and blundering experiment with the tried principles of production and exchange—these are the principal causes of the disarrangement of the economic life of people. Maybe the principal one is the desire to "retire." Any powerful man, whose ambition is to obtain wealth for the purpose of escaping his duty to the world, is a potential danger. Wealth never justifies idleness, and certainly idleness does not justify wealth. Wealth as the raw material of human service may be justifiable.

> *THE world is held together by the mass of honest folk who do their daily tasks, tend their own spot in the world, and have faith that at last the Right will come fully to its own. These are the salt of the earth, they constitute that saline solution which is forever reviving a moribund world. They believe that right motives make right conditions, that if their faces are turned toward the light they cannot miss the road, and all right-minded men desire to see this true faith of the people vindicated. This is our truest basis of prosperity. It is the essence of all our security. It is the promise of all our progress. If this faith should be lost from any considerable group of society, it would constitute a loss equal to that of all the material wealth we possess.*

It is possible to say, however, that just now we are probably in less danger from artificial causes of depression than at any time for many years. One reason for this is that we are at the end of a cycle of "getting something for nothing." Not only are the respectable practices of twenty-five years ago regarded with abhorrence now, but the practices themselves are beginning to bear the logical fruit of their nature. The sins of the past are piling up past bearing. There is no line of business in which false business practices flourished that is not today floundering on the brink of bankruptcy. Chickens are coming home to roost in such flocks that even the roosts cannot hold them. The meaning of the financial problems that beset the country today is not to be found in the war or any recent condition, but in the logical destructive results of wrong business practices that simply had to wind up in fitting retribution.

Thus the business servants of this generation have been made to realize in an impressive way that though a few may make quick gains and abscond from the field of activity, the results of their misconduct inevitably fall on the remaining business men and the public. So that it becomes part of business of self-protection to see that these questionable practices are not countenanced. Big business has always been concerned with the essential honesty of the smaller businesses that went to make up the greater unit, but now the importance of the matter has put the challenge up to the highest inside office.

Not that human nature has changed, that would be too much to expect. But the fact is that law has become more evident, the natural law, and men are more aware than before that now they are not playing with fellow men merely, not outwitting fellow speculators merely, but are playing with a remorseless economic law that cannot be outwitted by anyone.

This does not mean at all that a certain part of the people are any less easy to deceive: we are told that there are always a million or so of our citizens who will believe any preposterous financial statement made to them: it simply means that, as a matter-of-fact proposition, the men who are likely to remain in business, the men who because of their gifts and inclinations are likely to remain our economic managers, have learned that it is impossible to trick the law, the natural law of equity.

With these matters understood, then, one is free to say that there is no discernible cloud upon our industrial and economic affairs in the near future. We are really in somewhat better shape than we were several years ago, because now both labor and management have come down to more practicable conditions. A day's work is being done, and a proper day's pay is being more widely recognized. The whole relationship between management and labor, and between them both and the public, is much more simple and therefore much more honest. Our situation, our state of mind, our practices and purposes are more healthful all round. And that, of course, is one of the indispensable elements of sound prosperity.

There are signs that the condition of the farmer is improving. This is most welcome of all, because the farmer's turnover is slowest of all, necessarily, and because heretofore he has been least considered of all. The farmer who has been able to weather through the experience of the past several years will be a better farmer and a better manager in the future. It is rather hard to measure the permanent value of difficulty, but one feels that the experience of farmers in recent years is going to have the effect of giving us a new type of farmer, a man who has learned by the hard force of circumstances that he is in business, and that there is a business method by which he can protect himself from the self-seeking of others. This nation will never fully appreciate what it owes to the farmer and the other workers who carried on in the hope that right motives must make right conditions at last, and if there is one thing that right-minded people desire above all things to see it is this true faith of the people vindicated.

The year before us should be one of continued opportunity for work. That is the best any of us can expect in this career, to find our work, to have an opportunity to do it, and to achieve the experience which comes through doing it. We should greatly distrust all teachings or propaganda which casts a sinister light on our work. It is because the great managing minds lost faith in the social value of their work that they seek for quick fortunes and early retirement. It is because the people lose faith in the social value of their work that they succumb to the false teaching that the worker's toil has no other effect than to make the rich richer. It is the country, all the people of the country, who are ultimately the beneficiaries of all that all of us do, and once we know this—not as having been told it, but as having really seen and understood it—we shall give the strongest safeguard to economic security that it is possible for any people to give.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Are Americans Cowards?

THE *Christian Courier,* of Dallas, Texas, tells of a Federal judge, who, in addition to imposing a stiff penalty, including fine and imprisonment, severely excoriated the prisoner with whom he was dealing. The *Courier* charges it was "scathing and even beastly abuse," and denounces the act in unmeasured terms.

Neither the prisoner nor his legal adviser deemed it prudent to protest, fearing summary punishment for contempt of court. The editor was so impressed with the "despotic tyranny" of the judge that he inquired of a leading attorney as to whether there was any warrant in law for it, receiving the reply that there is no legal right, or moral right either, for such conduct on the bench, but that "I dare not raise my voice against it for fear of being sent to jail, and the very fact that I hesitate to say anything about the matter shows that we no longer have free speech in this country, and that our liberties are in great danger. And you will be taking chances to make any criticism of this judge in your paper."

Too many magistrates abuse the privilege of their high office to tickle the public ear and gain doubtful publicity by a display of verbal fireworks at the expense of helpless wretches before them. It is not only unseemly, but it "has nothing to do with the case." When a judge turns prosecutor, justice stands in jeopardy.

The element of fear on the part of the bar and public, as it appears in the quotations here given, is another point for consideration. It would be going too far to make reference on this account to anything resembling despotism or tyranny on the part of the courts, but every reader of every newspaper can recall incidents where a judge, having given his sentence, has been roused to anger by some ill-timed observation about his act, and in his anger has increased the severity of his sentence. The anger is unjudicial and the increased sentence in such circumstances is unjust, and the instinct of both bar and laity knows it.

Yet how often does one hear protest? Is it a question that even newspapers care to discuss? Do men take judges to task for obvious violations of their position? The lawyer here quoted says that men dare not criticize these public and notorious excesses of judicial zeal. If this is so—and there is enough truth in it to warrant this comment—then the condition has reached a point where a course of action should be considered.

The first hope would be the bar associations. They have the right to act as custodians of the character, dignity and fitness of the occupants of the bench. They are officers of the court and acting as associations would be sufficiently protected from any consequences that might otherwise be feared. Failing the bar associations, there are the newspapers, although their handling of such matters would have to be on a high plane to be effective. The motive in all such protest should be not the embarrassment of individual judges but the restoration and maintenance of the high traditions of our courts.

The last thing we wish to feel is that the bench is cowardly in dealing with helpless prisoners before it; or that the bar is cowardly in dealing with a growing lack of dignity on the bench; or that the public is cowardly in dealing with both if necessary.

A New Year's Wish

PROSPERITY is what everyone desires, and this country has had a very generous share of it during the past year, with excellent prospects for the year to come. But it is worth considering that it is not during times of prosperity that our principal progress is made in national matters. The people are not inclined to look for the roots of trouble unless the trouble is very apparent, as it seldom is during times of prosperity. Indeed, it is during times of prosperity and by means of prosperity that every tyrant in history has established himself. The people do not seem to care what is occurring in the upper circle of political or economic affairs as long as they are able to work, support their families and enjoy a few of the comforts of life. Even the clamor of communism dies down in times of general prosperity.

This is merely to note the fact, not to utter protest against it, for perhaps no protest could be so futile as that which notes the willingness of the people to relax in easy times. It is as it is—and that is all there is to it. Still, it is to be regretted, for if there is ever a time to work at the perfecting of our general system of industrial and social life it is during the time of prosperity. It is then that we can work without strain, without wrong suspicions, without the stinging sense of fear or foreboding, and with a proper perspective. The remedies which the people seek in times of distress are almost always wrong and often work more harm than does the distress itself. Yet it seems that it is only in times of distress that the people can be induced to turn their minds to the fact that we are living under a system completely amenable to our wise control, and so adjustable as to insure a continuance of opportunity to live properly. It is a pity that this is true, but it is true, and one of the evidences of wisdom is to recognize the fact.

In the year which is coming, our good conditions will continue. There will be work, there will be opportunity, there will be an increase in good will between all sections. The best New Year's Wish one could conceive for the United States would be that its people would not become morally drowsy under good conditions, but would gird themselves in mind to deal with the less pleasant facts which always lurk beneath the surface.

Less Detail for the President

A BILL has been introduced by Senator Edge to "lighten the responsibilities of the President of the United States." Is this just the result desired? Is the President to be relieved of responsibilities or of routine duties? So far as discussion of this matter has proceeded, the concensus of opinion seems to be not that the President is to be made any less the President, but less the office clerk. He must be kept fully responsible for all that pertains to his Administration. This he shares in part with his party organization. It is impossible for the best informed President to know all the men whom he appoints to office; he must rely on the party organization of the various states for information upon which to make many appointments; so that politics, insofar as it is not vitiated by selfishness or corruption, is of real assistance to the President. But to require that the President endlessly sign his name, endlessly devote himself to clerical details, endlessly do in detail what he could do in bulk, is to require too much under present conditions.

A simple way to proceed would seem to be a study of the machinery of the President's office, a study made by a commission say of two or three former Presidential secretaries with members of Congress, and then such recommendations of simplification which Congress could sanction by whatever amendments may be necessary. After all, it is not a matter which touches Presidential responsibility so much as the management of the executive office.

No Rouge at the White House

COMMON sense continues to mark all that the public is allowed to know of the new residents at the White House. The newspapers have thought it news to herald that the mistress of the Executive Mansion does not rouge, and that at a recent reception given by her there was a noticeable change in the complexion of the majority present, a change in the direction of naturalness. Lipsticks, eyebrow pencils, rouge pots and all the other aids to deceptive impressions seemed by common consent to be taboo. It would be interesting to know how the result was achieved—whether word was sent round, or whether it is an entirely new crowd that now assembles at the White House. One hesitates to think what may be the truth, that Washington society is sufficiently snobbish and imitative to leave rouge alone if the First Lady of the Land leaves it alone. However that may be, it is a good change and a good sign.

If One Could Know

THE quarrels of nations, as of men, grow often from concealed causes, and the apparent aggressor is not the actual one. Most wars could be avoided if only people knew the sinister influences within and without that fostered them. The cost of war is never borne by those who instigate it. The hatred necessary to war is cunningly nourished by secret plotters, who fatten their purses through the necessity of the plain people of the nations.

Many years ago, there appeared on the market in serial form a history of the United States—a handsome page, finely illustrated, and the text endorsed by leading public men. On its cover was a handsome allegorical picture of patriotism. The farmer left his plow in the furrow as he sprang to the colors, the artisan offered his services, *the capitalist offered his bag of gold.* It was inspiring. How many boyish hearts were fired with the desire to be at man's estate to be able, too, to show their valor in a glorious cause.

The form in which history has been given to us has had its part in making the conquests of war the chief marks of national progress. The young have been led to idolize military heroes, while the fame of greater men has been left to the student to discover. And from this false history a false philosophy has sprung, namely, that war is a biologic necessity. Thus nations are abroad with a figurative chip on their shoulders, to make enemy of any friend. This induced predisposition to fight is taken advantage of by the cunning, and, where no cause of friction exists, it is assumed or can be created.

But behold how the picture on that cover is spoiled! The young of all classes eagerly volunteer to "fight our country's battles," and the flower of the nation's youth is her first sacrifice. Then the fire of patriotism is apparently quenched, and replacements are secured by conscription. *But Midas was not a patriot from the first, for he never offered his bag of gold except for a bond which makes that of Shylock seem a cheap thing.*

Yet Midas caused the war. Human greed had to do with its inspiration. In this country there is less reason to expect war than in any other. Our part in foreign disputes has always been declaredly altruistic. But had there been no greed to serve, at least two Presidents of the United States since Lincoln would have been free of a pro-war pressure which turned their policies and purposes from peace to violence. Both executives opposed the force behind them until human nature could resist no longer, until Midas induced press, pulpit and populace to raise cries for war, which cries can honestly be faced today only by those who fought and those who mourn their soldier dead.

Is Bolshevism Jewish?

DO YOU remember, several years ago, that THE DEARBORN INDEPENDENT was telling the truth about Jewish rule in Russia while all the Jewish controlled press of the United States was denying it? A perfect file of that propaganda shows that gradually the truth won to the top, until now almost everywhere the Jewish rule of Russia is acknowledged.

Even Mrs. Clare Sheridan now states the fact in the most unconcerned fashion, and if there were any mitigation possible in behalf of the Jews, Mrs. Sheridan could be depended upon to find that mitigation. More wonderful still, the New York *World* prints what Mrs. Sheridan says!

"The communists are Jews," says Mrs. Sheridan in the *World* of December 13, "and Russia is being entirely administered by them. They are in every government office, in every bureau, in every newspaper office. These are not the caliber of those in British and American political, financial and intellectual life. Although New York seems to have cradled the Russian bureaucracy, they are of the type that the United States calls 'undesirable aliens,' people whom America is more pleased to see going than coming. But for the Russian revolution many of these bureaucrats would doubtless be behind their pawnbrokers' counters.

"Statistics show that 61,000 of them came to Moscow in September of this year. They are driving out the Russians and are responsible for the dangerous anti-Semitic feeling which is increasing."

That this is the truth and has been the truth from the beginning all informed people knew. But why there was such a determined attempt to deny the truth in the United States is not yet clear. It is equally puzzling how publicists can continue to take propaganda hand-outs from agencies which so grossly deceived and misled them before.

THE MOST LEM STREET

By LLEWELLYN SMITH

The writer of this article and others to follow is a Negro sociologist who is particularly interested in the larger aspects of America's racial problems. During the war he conducted a series of investigations dealing with the growth of radicalism among the Negroes, which took him to the "black belts" of both the North and the South. At present he is on the staff of a social service organization, national in its scope, which is devoting a great deal of attention to the study of some of the basic contributing factors to the so-called Negro problem.

IN A previous article the writer described the efforts of the Jews on the East Side of New York to convert the Negroes to socialism and communism. Now I shall show, by the presentation of a staggering array of evidence, that the appalling vice conditions existing in Harlem, the Negro quarter of New York City, are due principally to the encroachments being made by and the pernicious activities of Jewish bootleggers, cabaret owners, and rent gougers.

One thing Vera Simington endeavors to expose in her picturesque tales of African Congo life is the amount of social diseases introduced to the natives by whites. This very thing, on a relatively different order, of course, is being done in the Negro "belt" of New York, as I shall conclusively show, by a highly organized, highly financed clique of conscienceless Jewish exploiters.

With a population of 185,000 Negroes, Harlem is as foreign a Negro community as New York is a European capital marooned on the shores of North America. It is the destination of a large percentage of the migrants from the South, it is the spot where more than 60,000 West Indians reside, it is the most unscientifically organized Negro community in the United States.

Against the phenomenal business progress of Negroes in the South and West (segregation, of course, is largely responsible for this) there is practically no business activity by Negroes in Harlem. Most of the business done by colored people there, according to the New York *Herald* for August 26, 1923, is restricted to real estate. The *Herald* mentions John E. Nail, of the firm of Nail & Parker, realtors, as being the leading brokers. Of the Negro realtors operating in the Harlem district, Watt Terry, of Boston, is the wealthiest, his total holdings approximating $1,000,000.

A Negro Newspaper First to Protest

THE grocery, drug, confectionery, department store, restaurant, theatrical, haberdashery, and other businesses, however, are done for the most part by Jews. With the growth of de luxe cabarets, delicatessens, "rabbit foot" joints, and other establishments of questionable character, Harlem is an excellent illustration of a people, literally helpless, being brought to their knees by a band of commercial cutthroats.

There is, for example, a Jew-owned and Jew-operated (the Jews, although they trade on the colored people, seldom employ colored help in their stores and establishments) drug store which is grotesquely decorated with gargoyle-like signs painted in the crudest red, yellow and black, advertising such monstrosities as Malaguetta Pepper, Devil's Shoestring, Eyes Bright, High John License, Queen Elizabeth Herbs, Lovage Oil, Slate Vaseline, German Rue, Sally Luck, Blessed Thistle, Arabian Sparkling Incense, Congo Grass Green Oil, Khofu, Baume Tranguilla, Musk Root, Aristocia Rodiculatic, Allah Candles, Torial Powder (West Indian), Mercurial Blood, Crawfoot Root, Jupiter Eucalyptus, Imported Yonghee, Dried Aloes, John Conqueror Root, (High & Little), Adam & Eve, Sodom & Gomorrah Root, Indian Balm, Crawfoot, Myrtle (High John), Scared Bark, Dragon's Blood Candle, Five Finger Grass, Incense Francaise, Spelituia, Xofinaus, Live Loadstone, Sheep Gizzard, Alligator Dumpling, Sassafras Wine, Jerusalem Holy Oats, Christ Balm, St. Peter's Thistle, Sheepskin Parchment, Satan's Beard, Olive Brush, Eye's Stocking, Buckeye Root, Lavender Flowers, Abyssinian Violet Leaves, Good Old Jupiter, Hindu Charmer Incense, Beatrice Charm Burner, Horse Tail Rush, Swamp Beggars Tik, Devil's Bit, Bird Lice, Holy Herb, Pyrola and All Heal.

This is but one phase of the gigantic preying on the emotions and superstitions of the Negroes. The enormous amount of money being coined by these sleek-haired grafters from the ignorant and gullible who patronize the pharmacy of this Jew would go to erect several Tuskegees.

In describing the sort of place the "black belt" of Harlem is, I neglected to say that it, also, is a glorified house of assignation. That apothecary's, for example, is a spot where Negro women are lured, by the magic of the Jew's boasted antidotes for voodoo, to become the consorts of these lascivious whites.

There is a notorious Negro leisure class in Harlem which is limited to its women. There are hundreds of Negro girls and women who work as operators and finishers in Jewish shirt waist factories. It is one thing the black folk chuckle over and at which they shrug their shoulders resignedly—this wholesale maintaining of their prettiest women who live in luxurious apartments, sport the most fashionable of clothes and drive in expensive motor cars. Some day, however, there is going to come out of the exotic hovels of the "black belt" a ruthless realist, who is going to paint in daring colors the life of this black city.

There is, of course, the other method—that of using the "black belt" as a harem for a tribe of merchants from Sixth avenue who come uptown and visit cabarets that Negroes do not enter (because they cannot) and bring their women to dance and carouse till the wee hours of the morn. Harlem, Negro Harlem, to the Jew, is a place to take a lady companion who is not your wife, to "live," to spend and drink freely—and, lastly, to make money. To the Jew, it is literally a gold mine.

So far, the only voice that has been raised in Negro Harlem against this carnival of licentiousness, and the awful crimes that are being committed, is that of the New York *Age,* a Negro weekly newspaper which was founded by Booker T. Washington about twenty-five years ago. The *Age,* edited by Fred R. Moore, a noted Negro leader, sent a special investigator, after receiving complaints and petitions from representatives of the best, most respectable citizens of Harlem, to study the vice conditions.

According to the *Age's* investigator, Harlem is a hootch seller's paradise. **There are 162 places on Lenox and Seventh avenues, between 128th and 145th streets, where drinks may be obtained as easily as before prohibition. Most of these places are delicatessen stores, soft drink cafés, news stands and stationery stores.** But there are several malt shops and a few saloons that have remained open, which are flourishing beyond the fondest hopes of their owners.

The Paradise of the Jewish Drug Store

SO PROSPEROUS have these places become that, in three months, several small cafés have been opened, ostensibly to sell soft drinks but really as saloons.

Recently, a shoe repairing store on Seventh avenue cut the store in half and leased half of the floor space for use as a beverage café. The proprietor of this place has found business so good that he is now seeking other locations.

On Lenox avenue the cigar stores, news stands and delicatessens, which are all run by Jews, are the biggest sellers of "hootch." In one block on Lenox avenue there are a delicatessen and two cigar stores on one side of the street, and two drug stores and a delicatessen on the other, where drinks may be obtained over the counter or in bottles. Competition among the "hootch" dispensing places in this particular block has become so keen that no one needs to be identified or use a fictitious name when asking for a drink.

Except for the drug stores, home brew or hurriedly distilled liquors are sold at these places. Gin is the most popular drink sold, as it is the easiest made and has an immediate effect. The other beverages are generally made with gin as a base, with other ingredients added to give it color.

Harlem can boast of more "drug stores" than any similar area in the world. On Seventh and Lenox avenues, between 145th and 128th streets, there are forty-five drug stores, and almost as many more on Fifth and Eighth avenues. Many of these places are doing a legitimate business, but there are those in this number which receive the bulk of their revenue from the sale of liquor or patent medicines containing a large percentage of alcohol.

Although the health records show no startling increase in sickness in this particular neighborhood, drug stores have increased a hundred per cent during the past two years, with as many as two or three in the same block in some sections. Among the many business failures of the past two years, less than one per cent have been drug stores.

The increase of crime generally and the lowering of the moral standards of this section have been in proportion to the increase of the places which sell these drinks. According to the *Age* investigator, the bootleggers in Harlem are so bold that they are not in the least careful as to the circumstances under which they conduct their conferences with the law agents. A Federal agent was hailed on Lenox avenue, by the man running a "hootch" joint, and held for at least thirty minutes in close conversation, the two men standing on the sidewalk in plain view of all who passed. *An onlooker, knowing both men, declared that it appeared as though the revenue agent was trying to pass without showing any signs of recognition of the bootlegger, but the latter, a Jew, would not have it that way. From his manner, it seemed he wanted the world to know that he was in a position to dictate to the agent, and that he could control the latter at any time.*

In fact, said the Age's informant, the bootlegger seemed desirous of advertising the hold he seemed to have over the Federal agent.

Using the Negro as a Screen

THE whole of Harlem is being honeycombed with delicatessens, malt parlors, cigar stores, lunch places, and other apparently innocent business ventures that camouflage the real purpose of the proprietor, which is to sell rank, newly concocted synthetic gin and corn alcoholic beverages, called whisky by mistaken courtesy.

With the opening of so many places has come a flood of cabarets which cater to an element not ordinarily given to patronizing the delicatessen and malt parlor "hootch" parlors. These places allege that they are not selling booze, that they are catering to the groups that seek recreation and pleasure on the dance floor and at the dining table.

But, say the residents of Harlem, if this is true, the question is asked: Why have so many of the long established and well-known dining and dancing places of the city, in all sections, from the bright light districts to the Bronxian purlieus, been compelled to close down, giving as a reason the impossibility of continuing to exist as eating and dancing places only, without an income from selling alcoholic drinks?

How can these Harlem places, depending upon a smaller and poorer group, make a financial success?

According to the *Age* opinion is that the people are not clamoring for these places. Colored men serve as a screen to real ownership of these places.

What appears to be an effort to secure a monopoly of the "hootch" trade is alleged to be found in the reputed chain of places owned by one interest—known to be Jewish. These places are on Lenox avenue at short distances apart. Another interest, it is alleged, owns at least three places on Lenox avenue.

Stirred by the *Age's* exposé, Negroes endeavored to stop the reopening of a cabaret from which when raided last spring sixteen white girls and twenty-four white men, including not a single Negro man or woman, were taken.

Continuing its campaign the *Age* reported:

> "Many written and spoken protests have been made by leading men and women of Harlem to the granting of a license for the proposed reopening of the cabaret located in the basement of the Lafayette Theater building, formerly known as 'Shuffle Inn,' the proposition being promoted and financed by one Connie Immerman, a Jew, who has seemingly enlisted the support of a certain Harlem Negro element in his enterprise."

Immerman made an effort to allay opposition and hostility to his venture by aligning himself with the Colored Cabaret Owners' Association. Immerman's application, however, was turned down by this body.

Medical Quacks and the "Sucker Machine"

The Tragedy of Abused Confidence as Witnessed in the Pathetic Trust Given Charlatans by Sick Folk

By J. OLIN HOWE

ODDLY enough, Albert Abrams, of whose "electronic reactions" The Dearborn Independent has told the facts in some detail, figures in connection with the exposure of bogus doctors in Missouri and Connecticut and elsewhere. Not that Dr. Abrams has been personally concerned in the activities of the diploma ring. Not that at all. But his much-advertised machine is the model for electrical machines—"sucker boxes," they call them—which those engaged in selling bad diplomas have been furnishing their "graduates." They even make typewritten copies of Abrams' E. R. A. book to go with them.

"Smart as you are," said Dr. Ralph Voight, of Kansas City, self-styled master of the spurious ring, to Harry Brundidge, the St. Louis newspaperman who became an M. D. and a chiropractor in less than two months on payment of $1,200, "you ought to be a 'sucker machine' king in a couple of months."

The doctor had agreed to get back such a machine from another doctor to whom he had sold it and turn it over to Brundidge for $150.

"I've seen dumb bells," he said, "who could hardly read, pitch their diploma and license, set up a machine and make $400 or $500 the first week. It's a great racket."

A Glib Talker and Verbal Salve

DR. ROBERT ADCOX, of St. Louis, who looked after details of the ring's affairs in that city, also told Brundidge this:

"Buy one of those hocus-pocus electrical machines, set up a pretty bunch of magical dials and lights, hang a few black curtains and your office will be crowded with suckers from dawn till dark. It's the easiest game in the world, the electricity dodge, and you don't have to know a darn thing to work it except how to go to the bank with your money.

"Tell your patients how well they are looking and how much their condition has improved, and the psychological effect of the wonderful machine and your own verbal salve will make them think they are new men and women. Of course, a street car motorman could do your patients just as much good by letting them hold the controller of the car's motor, but the poor boobs don't know that."

This is street corner language, to be sure, and far more expressive than elegant; but these men know whereof they speak. They have had long experience with the gullibility of the American public. We know so little about ourselves and so much less of what should be done when anything is wrong with us that we are easily mystified by a glib talker with some shrewdness in reading human nature.

Few ever question a doctor's sign; those who do are apt to go much too far the other way and abandon belief in all doctors; but for the great majority the magic letters, M. D., or even the title "Doctor" is all that is necessary.

I knew an Englishman who brought to America the diplomas, credentials, and other papers of his dead brother, who had been a surgeon in the British army, and know the drug store where is on file a prescription he wrote containing twenty-nine (29—count 'em) ingredients, but he never lacked for patients. It is useless to ask for his address. He, too, is now dead.

The "Sucker Machine" a Winner

WHEN we do go to a properly qualified physician we don't want to be told we must eat less, smoke less, sleep more, take more exercise, get out in the open air. The physicians, the really good ones, have learned that specific remedies, such as those upon which the profession for a half-century expended much research, have very little value, after all; nature alone cures and the most we can do is to give her some aid.

Dr. Hugh Cabot says there are only six drugs which have real worth. But the bulk of humanity knows nothing of this and still regards the doctor as a wonder worker who has but to write a prescription or leave a box of pink pills.

And this is where these "electro-medical" or "biochemical" doctors come in who are so plentiful in some parts of the country. They appear in town from nowhere, run large advertisements in the local papers, have extensive offices in some office building or a considerable suite in a second-class hotel and before the community becomes aroused to what is going on have made a quick clean-up and moved on.

Or sometimes they locate in a city for a considerable stay, where conditions are such that they are likely to get away with it. And at times they play a circuit of cities and appear in each with some regularity.

The "sucker machine" is their chief property. By means of it they pretend to diagnose the patient's condition. Watch in hand, the doctor, clothed in impressive black and with serious mien and the air of doing his duty, kindly but sincerely stands near the dials after handing the patient what looks like an electrode, the cord to which is connected with the machine.

As the doctor presses a button a yellow light may come on. It flickers a bit and finally settles down into a dim radiance, and the needle on the dial near, which jumped at first, has fluttered back toward zero again. The doctor turns to the anxious patient and says gravely:

"Mr. Jones, that machine is almost human. It detects things we might never know of otherwise. You can thank your lucky stars that yellow light is not on full blast. Indeed you can, my dear sir. As it is, we can fix you up all right if you will do just as you're told.

"You have a slight touch of tuberculosis, but careful diet and the use of such remedies as I shall give you will straighten that out, I am sure. You'll have to watch yourself, though, and you should pay your respects to that machine for finding out what is the matter with you."

Perhaps, instead of the yellow light, a blue light flashes on and then settles to a faint glow.

"Ah," says the doctor, "the heart. The poor old heart. But don't be nervous. Let me listen to it a moment. We haven't enough glow to alarm us. Yes," as he listens to the heart, possibly with a stethoscope, "you'll be all right. That machine always tells the truth, Mr. Jones. Always. It's absolutely infallible. And now that we know just where we stand, don't worry; we have a course of treatment exactly for your condition."

The machine has also red and green lights and, in place of giving a steady glow, one of these, or one of the others, may flash at two-second intervals, say. That means something else; and if the doctor can't think of anything, he always has the book to help him out.

Only a Money Game, After All

IT IS easy to see how many different signals and possible combinations can be worked out by means of these lights, but the machine is never connected up to sufficient current to mean anything at all, in fact. It is all a hoax.

A clever operator of the "sucker box" always finds out how much money the patient has and arranges his fees accordingly. Experts in its use frequently get $400 or $500 from a single patient. They even take notes sometimes, if not in too great a hurry to leave the locality. The medicines they use are specially prepared from tonic formulas containing a heavy percentage of alcohol.

These "sucker machines" are used wholly for so-called diagnosis, to hoodwink the patient with the idea that the latest discoveries of science are being made use of in his case. But the transition from a machine whose principal harm lies in the patient's belief in it and its operator to real electrical apparatus and the violet ray is an easy one; and from that to the X-ray.

Dr. James T. Case, professor of roentgenology in the School of Medicine of Northwestern University and a leading authority on the X-ray, told fellow physicians lately, that the sanitarium sees many victims of the quack and charlatan who have been brought to their deplorable condition by unqualified persons.

Indeed, the old showman was right about the ease with which we are befooled. We fool ourselves, and never more readily than when half sick.

"The blatant and persistent publicity of incompetents exalts their bogus skill," Dr. Charles L. Whalen, of Chicago, said to the American Medical Editors' Association recently. "Besieged on all sides by the cry of the charlatan—the medical profession forbids self-exploitation—the sick man hears and believes to his own undoing. He hears vaguely of wonderful progress and miraculous cures and unknowingly submits himself to the quack."

Wish-fulfillment, the psychologists call it—the real scientists, that is, in whose work philosophy finds no place—turning on Freud and his psychoanalysts a term which originated, I believe, with the Austrian doctor.

The Optical Field Involved

IN ONE of our largest inland cities is a case in point. An oculist, who is in fact a regularly educated physician, has obtained no little vogue by advising patients to throw away their glasses. He teaches them how to get along without glasses according to his ideas. The fallacy of these has been shown up and the medical profession generally makes no secret of the vital flaw in his methods, but his waiting room is crowded and he prospers.

This doctor discards entirely the fact that the crystalline lens of the eye hardens with advancing years, that a fifty-year-old eye cannot possibly focus as a twenty-year-old one can, and insists that his ocular exercises and exposure of the eye to intense light will so strengthen it as to make artificial aids to vision unnecessary. His classes are so largely attended he cannot care for all the work personally and his fees must reach a very large total.

In his city is a woman of marked social prominence whose eyes have been so defective for some years that she should have worn glasses. Indeed, she has worn them, intermittently, upon the urging of her eye specialist, but always reluctantly, insisting that there should be some other method of relieving her difficulty than by the glasses she considers so unsightly.

This other eye doctor seemed to her heaven-sent. She became a patient of his and laid aside her glasses, as she believed, for good. Her old doctor learned the facts and supposed he would never again see her in his office. But one day she came in.

"Yes," she said, "I'm one of Dr. Blank's patients and I can see perfectly well without glasses. I'm never going to wear them again. I can read the finest print perfectly." And she produced a card covered with the finest type and read its contents easily.

"I didn't come to you for glasses," she went on, "but on account of a slight inflammation in one eye which I'd rather have you treat."

"You do seem to be doing well," the doctor remarked. "I wish you would read from my test card here—that finest type—you can read it with ease, of course, for it isn't as fine as what you have on your card—but I'd like to see where you hold the card."

She couldn't read a word on his test card!

She had, probably unconsciously, memorized the matter upon her own card and only thought she was reading that.

Barnum Was a True Philosopher

SO THEN the specialist got her to submit to a thorough examination of her eyes and later compared the result with that of her last previous examination by him. Her eyes hadn't improved an iota under the new man's treatment. In fact, they had gone back. The inexorable course of nature had made it more difficult for her to see. But she thought she could see better and the specialist didn't disabuse her mind.

Wish-fulfillment. Barnum was right. Yet here is an exception to that rule. A man of great wealth in another of our largest cities, who is losing his hearing, had heard of a doctor who was having wonderful success with deafness. The doctor used electrical treatment and other original methods. He had cured many, the story went, and finally the great man became sufficiently sold on him to give him a trial.

But he made much of his money himself and is alert to most of the possibilities. Wherefore before consulting this man he went to a scientific laboratory where he happened to know their work in audition had given the scientists a machine to test human hearing to an exceedingly fine point and with absolute accuracy. Here the deaf man had his hearing tested thoroughly and the record was filed away.

Only then did he go to the aurist.

"Yes," said the latter, "I believe I can help you. Your hearing is not so impaired but what treatment will do much for you and I have hopes of bringing you back to normal. At all events, I can promise you improvement."

All Classes Fall With Equal Ease

THE doctor put his distinguished patient through the full ritual, shot colored lights through his ears and all the rest of it. At the proper time, holding his watch, first to one of the patient's ears and then to the other, he asked, "Do you hear better now, Mr. So-and-So, or not?"

"Why, yes," replied the patient, "I believe I do. I really think I do."

"I thought so," said the doctor with a smile. And he advised further treatments, which he was sure would bring gratifying results.

The business man did follow his treatments for awhile and really thought his hearing was improving. But ere long the time came when he wanted to know and he went to the laboratory again and had his hearing tested once more to check up on the gain, if any.

There hadn't been any.

The aurist's treatments had not changed his hearing in the slightest degree!

And that gentleman lost one patient forthwith.

Not long ago Dr. Stratton D. Brooks, president of the University of Missouri, addressing a medical class, said this:

"Our graveyards are filled with the victims of vicious quacks with plausible personalities who have graduated from inferior schools or who masquerade as doctors under the protection of purchased diplomas.

"The humblest citizen in the remotest rural district should feel assured that the physician he summons to save his loved ones from death knows what has been done in the best medical laboratories of the world. But he has no way of knowing whether the man he summons has such knowledge or, having it, knows how to apply it."

The Lesson Nelson's Sni-a-Bar Has Taught

Late Publisher of Great Western Newspaper Pioneered in Raising Stock Standards

By E. B. CHAPMAN

A FEW weeks ago the secretary of the United States Department of Agriculture journeyed halfway across the continent to indorse the work of one man. With him met leaders in agriculture from various sections of the world. There were O. E. Bradfute, president of the American Farm Bureau Federation, Rudolph Kurez, minister of agriculture of Czecho-Slovakia, Wladyslaw Koziowsky, from Poland, Judge W. K. James, president of the International Farm Congress and men from Canada and half a score of other lands. Thirteen foreign countries and twenty-six American states were represented in the crowd.

On the platform with the speakers, members of the staffs of several agricultural colleges occupied chairs. There were farm leaders representing corn, wheat and live stock marketing organizations. There were representatives of twelve state boards of agriculture. Besides those listed there were 8,000 persons from farms.

They spent the day on a farm, discussing farm problems in general, but mostly live stock and particularly cattle. Yet the man whose work they were inspecting was not a farmer. Rather he was a city man and one whose problems, as a business man, were city problems.

Notwithstanding his city environment he was one of the first to see what then was and now is the present farm crisis, accentuated probably by the war and the conditions that followed it, but on the way, inevitably, when he, one of the first in the nation to do so, visioned it and set about to correct it.

The demonstration pens at Sni-a-Bar Farms.

Now the Federal Government, the agricultural colleges and many organizations, agricultural, commercial and civic, have seen the problem and are working along the trail he blazed in relieving the situation.

Perhaps it was because he attacked the problem as a business man rather than as a farmer, that success has come to the live stock project established by W. R. Nelson, founder of the Kansas City *Star,* to show the nation the waste in the production of poor live stock. With a true business man's abhorrence of waste in any form and a vision of the approach of the time when the farmer must become a business man rather than a tiller of the soil, if he were to succeed, Mr. Nelson began, before the need generally was noted, to point out a remedy. He was the voice crying out in the wilderness in the use of better live stock.

Kansas City is the capital of the great southwestern empire of corn, wheat and live stock. That was one of the reasons the Indianian, his fortune wiped out in the early eighties because he had signed another's paper, came to Kansas City to start a newspaper.

With the foresight that was to become his chief characteristic, he saw the development that would result in the prosperity of the Southwest. That meant prosperity in Kansas City and so prosperity for the *Star.*

And his hobby, in building, whether a newspaper, good roads, a residential section, a paper mill or the prosperity of a vast agricultural section, was to build permanently.

It was to building an agricultural prosperity that he devoted the later years of his life. He had seen the cream of fertility taken from the soil of the great Middle West and its adjacent territory. He had seen the golden stream of dollars that came back to his section in exchange. He desired the continuance of that golden stream but he saw the decline in yields that altogether too quickly was following the opening of the prairies to the careless and extravagant systems of farming then in use.

Because he was a business man, he sought a remedy. He was not one to sit with wringing hands and dread a situation that was approaching. Nothing wrong but could be righted, he believed.

Land values were rising. There was no more free land. Labor costs were mounting. Production on the farm was costing more. The Nelson idea was not that labor should be compelled to take less. He did not believe succeeding generations on farms should be denied the opportunity to prosper simply because farming as it had been carried on no longer would return a profit. He desired the laborer should draw still better wages and the farmer become even more prosperous. The editor believed the farmer and his wife and children should live better than they were living. He knew that the way to better living conditions lay in providing more money with which to obtain them.

So Nelson sought a way to restore to the newly opened soils the fertility they were losing so rapidly through uneconomic cropping conditions. The rivers were being filled with the rich top soil at each succeeding rain at a rate that, according to experiment stations, meant the loss of the top seven inches of soil in a lifetime.

The editor learned that on farms where the crop-producing elements were being conserved there were cattle. The cattle required pasture. That meant the sod would not be plowed up so the soil might be washed away. On live stock farms the crops grown and fed to cattle took less fertility away because all that the steer did not use in growth or fattening was spread back upon the pastures and fields.

He found that the farmer who prospered, year in and year out, kept live stock. He saw the highly specialized one-crop farmer was helpless financially when weather or insects destroyed the crop or unusual economic conditions caused heavy price slumps.

Therefore, it seemed to Mr. Nelson, the best plan for a permanent prosperity for the Middle West and the Southwest lay in live stock on all farms. And the study of live stock conditions revealed another waste that since has proved as shocking to the rest of the world as it was then to him. That was in the poor quality of farm cattle.

The HON. H. C. WALLACE, Secretary of Agriculture (right), and O. E. BRADFUTE, president American Federation of Farm Bureaus at the Sni-a-Bar Farms demonstration.

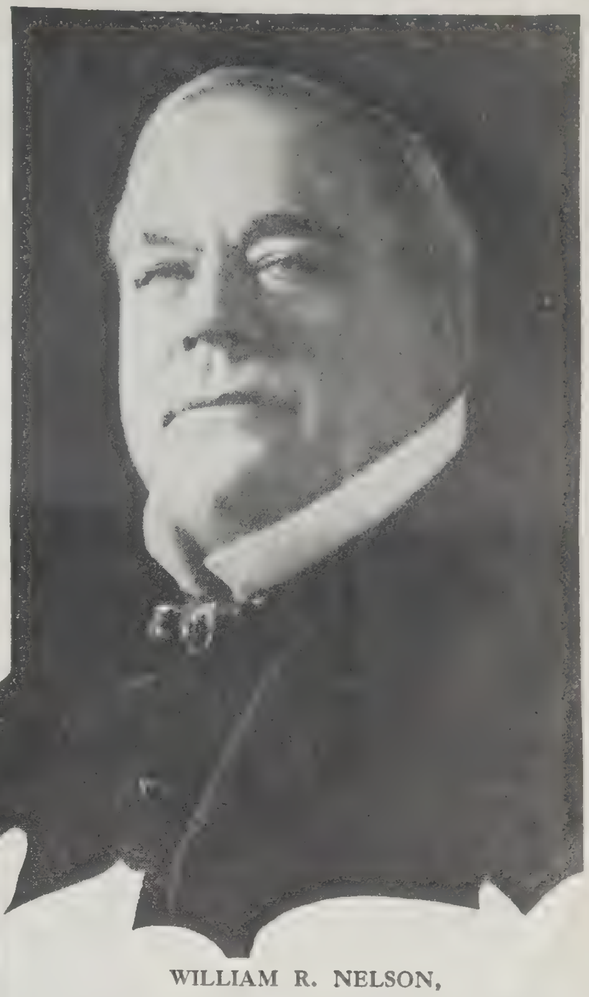
Here and there scattered about the great live stock producing section were a few men who realized that an animal of good quality, which would yield more good meat for the consumer and therefore command a higher price from the packer, could be grown on the feed that would grow a poor quality animal. That meant, to the business man, producing a better selling, better priced quality article at the same cost as a low priced "scrub" output, little in demand and yielding a minimum rather than a maximum of service to the consuming public.

These combined situations so impressed Mr. Nelson that he decided to divert part of his funds, not to making two blades of grass grow where one grew before, as would have been the case with the farmer, but to producing an animal that would, because he was a better machine for that purpose, use more of the grass for making human food and, because of that fact, sell for a higher price while costing no more to produce.

So, the business-man-editor established the largest demonstration of its kind in the world and provided for it to continue longer than any other such demonstration to prove to the farmer that it paid not only to keep live stock on the farm but that it paid to produce good live stock. The demonstration has attracted attention all over the world. Visitors from many foreign countries have inspected it. Men from almost every state in the Union have studied its lessons at close range. The largest number of visitors to see the farm at one time saw the farm the day Secretary Wallace visited it not long ago.

In showing the nation how to produce good live stock economically, the Nelson business judgment again was apparent. In making the preparations for the work he knew he must operate on a scale large enough to command first the attention and then the respect of the farmer. So an 1,800-acre tract was assembled in Sni-a-Bar township, near Grain Valley, Missouri, thirty miles east of Kansas City. The tract was named Sni-a-Bar Farms.

No fine buildings were constructed. It was not to be a rich man's show place but a business demonstration. The homes were lighted electrically because the Nelson idea was that the farmer, his wife and children should have electric lights and current for power that labor-saving machinery, which would require power, might be used. Running water was placed in the houses because the business man in Mr. Nelson cried out against the economic waste in hours and energy spent in carrying water into the house from spring or well. Inside toilets were installed for sanitary reasons.



WILLIAM R. NELSON,

Founder of the Kansas City *Star,* and Sni-a-Bar Farms.

Then the stage was set for the live stock activities of the farm. Four hundred common red cows were bought on the Kansas City market—cows that had been sold by the farmers of Missouri, Kansas, Iowa, Arkansas, Oklahoma, Nebraska and Colorado. These cows were taken to the farm. There they were mated with good, pure-bred sires. When calves came the females were kept, mated with other good, pure-bred sires and the process repeated over and over.

The results of the first cross of pure blood with the common red cows were startling in the improvement shown over the mothers. The second and later crosses were accompanied by certain refinements, more outstanding quality, and resulted in the production of animals that brought higher bids.

The common-sense method of producing better live stock on the farm has been taken up by other Kansas City business men. Through the chamber of commerce co-operating with the active county agricultural organizations, 2,500 scrubs have been replaced with purebreds.

Once each year all persons interested are invited to be guests of Sni-a-Bar Farms. The cattle showing the various stages of development are placed in pens built for that purpose. They range from original red cows to choicest fat steers, some of which have won championships at the big western fairs, waddling under their load of choice cuts of meat.

Men from agricultural colleges, cattle feeders, and sometimes representatives of the packers, point out the various changes made, show where the good cuts of meat come from, their increased quality as the quality of the animal is raised, and why prices are better for the good animal than for the scrub. Widely known speakers, led by the Secretary of Agriculture, point out how the lessons taught may be applied on farms. A Kansas City caterer serves truck loads of lunch at the expense of the farms.

Farmers drive to the meeting from five states. And each year brings an increasing number who are grading up their herds the Sni-a-Bar way.

The Nelson demonstration has sought to impress on the farmer that he, the farmer, might profit by practicing business methods on the farm—by producing a higher quality, better selling, more valuable article at the same expense used to produce an inferior one which would command, by its inferiority, a minimum price.

Indian Dwarfs of the Wilds of South America

Ethnological Report of Late Theodoor de Booy Reveals Discovery of Tribe of Interesting Savages in Fastnesses of Venezuela

By WILLIAM A. M'GARRY

IN A certain type of fiction it is customary to paint the modern soldier of fortune as a man who sulks somewhere in a city in the belief that there are no more worlds to conquer. If the writers really believe that, it indicates simply that they are out of touch. The real adventurer works today for the scientist.

Such a person was the late Theodoor de Booy, traveler, lecturer, writer, ethnologist and adventurer, a man with an insatiable thirst for untrodden fields. Shortly before his death he wrote for the University Museum of Philadelphia an ethnological report. That sounds dry, but it was the story of a race of dwarfs living in an almost perpetual fog on a mountain range so difficult of access that only one white man is known to have penetrated for any distance into its fastnesses, and that man was De Booy. And a few days' march beyond the last known settlements of that strange tribe the report gives the definite location of a mysterious mountain at the foot of which is an ancient burial cave that according to popular legend among the Indians is a veritable treasure-house of golden ornaments.

The region the report describes is in the New World, in the wild and mountainous jungle land lying on the borders of Venezuela and Colombia. Travelers into that country since the days of the Spanish Conquerors have known of the existence of the Macoas, as the dwarf Indians are known, but none of them has solved the ethnological riddle of the race, and their origin is still lost in antiquity.

Nowhere in the world is there a race more primitive. For that reason alone the facts concerning this people are of the utmost value in the study of the evolution of man. Scientists and philosophers alike are constantly speculating as to the slow steps taken by man toward civilization from savagery. Here in the Sierra de Perija has been discovered a tribe living as men presumably lived throughout the world fifteen or twenty thousand years ago. They have not learned the use of the flint and steel. Fire is still made by rubbing sticks of wood together. Even the warfare that these Indians have carried on for centuries with other tribes has not stamped out the savage instinct of isolation. Each head of a family occupies his own hilltop, which is sometimes as far as a mile or two from that of his nearest neighbor and a half day's journey from his plantation. Some of their food comes from agriculture, but apart from that they live as man is believed to have lived before he became sufficiently civilized to realize that his strength lay in co-operation.

Macoa child.

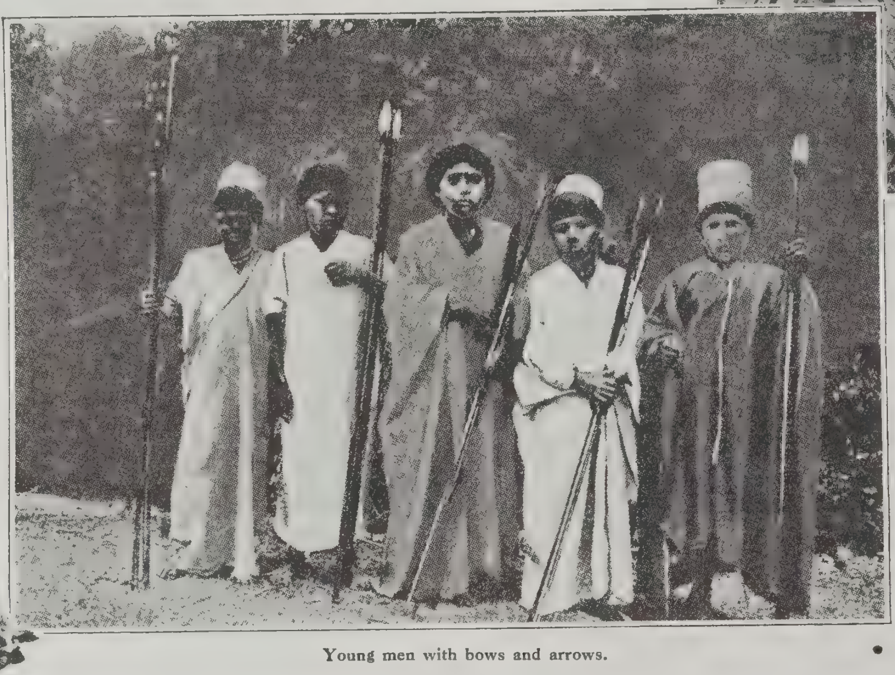
De Booy landed at Maracaibo on his adventure to the haunts of the Macoas, and then traveled two days to reach the small settlement of La Horqueta, where he established headquarters. The way led him through a jungle infested with tigers, jaguars, wildcats, monkeys and deer. From La Horqueta he rode nine hours to Machiques. Up to that time he had been unable to gain anything but scraps of information concerning the Macoas. But near Machiques was a ranch to which in times of need came other Indians, the Tucucus. A small group of the latter had had trouble with their own people and were in camp with the Macoas. Through them the explorer managed after much difficulty to reach the dwarf tribe.

"The researches of this expedition," says the report, "proved that the Tucucus, the Irapenos, the Pariris, the Macoas, the Rio Negro and the Rio Yasa Indians belong to the great Motilone family. For many centuries the Motilones have proved to be a mystery and the information we have of them, in ancient and contemporary literature, is very scant and for the greater part untrustworthy. They are today regarded with great dread by the Venezuelans, who are unwilling to penetrate into their mountain retreats."

Much parleying was necessary before the explorer induced some of the Tucucus to guide him to the camp of the Macoas. Finally a group agreed to visit the camp to get permission for the white man to enter. In a week they returned with the information that De Booy could make the visit if he brought only one other man. Since he was not accompanied by any other white, he took along a peon. During his wait at Machiques he had made many friends. They used every argument to prevent him from making the trip. When he left, the inhabitants of the village turned out en masse, convinced that he would never return. Then the explorer and his Indian guides plunged into the jungle, and for two days they followed a tortuous trail.

"The Tucucus told me when we were close to the Macoa village," says the report, "and they began to shout so as to let the Macoas know we were coming. The settlement of the Macoas is scattered, no two huts being found in close proximity. In fact, these Indians seem to take pleasure in living as far removed from each other as possible, which may be due to the eternal fights they wage among themselves. Each hut is on a separate hilltop, so that, while the entire village is within hailing distance, it often takes as much as half an hour to go from one abode to another, by first descending one slope and then ascending the other. The average altitude of the Macoa settlement is 3,600 feet. Their clearings and plantations are also far removed from their huts, so that it frequently takes a man almost half a day to walk to his farm.

"It would be hard to describe the Sierra de Perija. One seldom gets a good view of it and the peaks are covered with eternal mists. While the altitude of the mountains is not sufficiently high to make them snow covered, the fogs and mists at times would almost make one think that the summits were covered with snow. On clear days one can see that the mountains are densely wooded up to their very summits. Practically every day the mists roll down the mountains at about midday, and one spends the balance of the day in an enveloping fog which makes one forget that the equator is but ten degrees distant.



Young men with bows and arrows.

"On the arrival of our party at the first Macoa hut, the Indians of the tribe appeared to spring from the very earth and quickly surrounded us with every evidence of good intentions. Their friendliness was a trifle embarrassing. Within a short while, the entire tribe had gathered around and were examining me with the minute attention that a biologist might give a new species. My clothes were touched and examined, and several of the men put their hands on my face and hands. My eyes also were scrutinized with great care. The first thing they did for me was to build me a hut along the same lines as the huts inhabited by them, but of far larger dimensions.

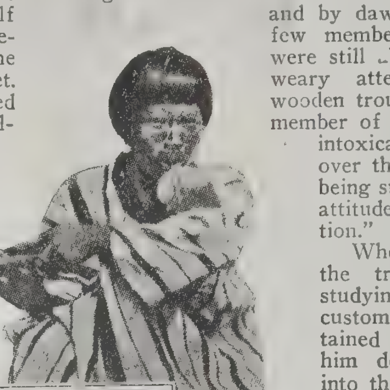
"Not only were the Indians interested in my general appearance, but my size filled them with curiosity. This can be understood when I mention that the average height of the Macoa men is five feet one inch, while the average height of the women is four feet eight inches. As a result, they seemed to reason that the tall stranger needed a hut far larger than those they inhabited.

"Stockily built, with short-cut hair, high cheekbones, and somewhat unclean in their personal habits, the Macoas are not attractive to look at, especially so because the intricate designs they paint on their faces are apt to give them a gruesome appearance. Men and women alike are seldom seen without face paint, for which black, brown and scarlet pigments are used. The little children even are decorated in this manner. The men wear a one-piece robe, resembling a gigantic sack, with holes for the arms and the head. The Macoa women wear a dress consisting of a loin cloth and a mantle. Frequently the mantle is left off, the upper part of the body remaining nude during the daytime when the cold is not so intense.

"The preparation of their food is highly primitive, and generally consists of placing their game, plantains and yams in the coals and eating them half raw. For arms, the Macoas use various types of arrows, which are discharged by bows. The Macoa boy is initiated into the science of archery at an early age, it being no uncommon sight to see small boys of five waddling about with a miniature bow and arrows. Perhaps one of the most interesting customs of the Macoas is the Chica feast. They indulge in this feast almost every month when the moon is full. Chica is made of maize pellets, crushed ripe bananas and crushed sweet potatoes, over which water is poured.

"After drinking for about four hours, the Indians generally become quarrelsome and want to fight among themselves. About midnight the dancing begins, continuing until dawn, those who drop from sheer exhaustion being pulled to their feet and encouraged by those that are less intoxicated. It is a point of etiquette among the Macoas to finish the entire brew of Chica, and by dawn one would see the few members of the tribe that were still able to walk making a weary attempt to empty the wooden troughs. Finally, the last member of the tribe succumbs to intoxication and silence reigns over the clearing, the ground being strewn by Indians in all attitudes of drunken exhaustion."

When he had lived with the tribe for six weeks, studying their language and customs, Mr. de Booy obtained information that made him determine to press on into the mountains. The Macoas were reluctant to go, but finally he induced four of them to accompany him as pack carriers. Some food was taken, but it was felt that game would be obtainable. The Indians had told him of the mysterious burial cave at the foot of a mountain near which they had lived. There was a trail for part of the first day then the party struck wilderness. From then until the end of the fifth day it was necessary to clear the trail through the jungle.



Macoa flute player.

Contrary to expectations, no game was sighted. Occasionally the explorers came across the tracks of a bear. At such times the Indians promptly dropped their burdens and started in pursuit. They were quite tireless, but unsuccessful. Also, Mr. de Booy found that centuries of independence had made them poor helpers. If one of them sighted on a far-off plateau some reeds, all four dropped the task at hand to get some for arrows. Nothing the head of the expedition could do or say had any effect.

At the end of the fourth day the food supplies which had been brought along from the encampment were exhausted. The Indians wanted to turn back then, but Mr. de Booy induced them by one argument or another to press on for another day. By that time they were in sight of the curiously shaped peak at the foot of which, according to the legend, was the burial cave. The mere sight of the peak had a curious effect on the Indians. With the end in sight, they refused flatly to continue. It was quite evident that in their legends they had surrounded the cave with some superstitious power. The tribe had been shunning it for years. Later Mr. de Booy learned that some time in the distant past the ancestors of the Macoas had met with a terrible reverse in battle at or near the mountain.

Accordingly the party turned back on the fifth day. Since there was no food to carry the packs were quite light. Also the trail had been cut, and it required only one day's travel to reach the encampment. The travelers had nothing to eat and the Indians became rather bad tempered, but there was no real trouble and all arrived safely in camp.

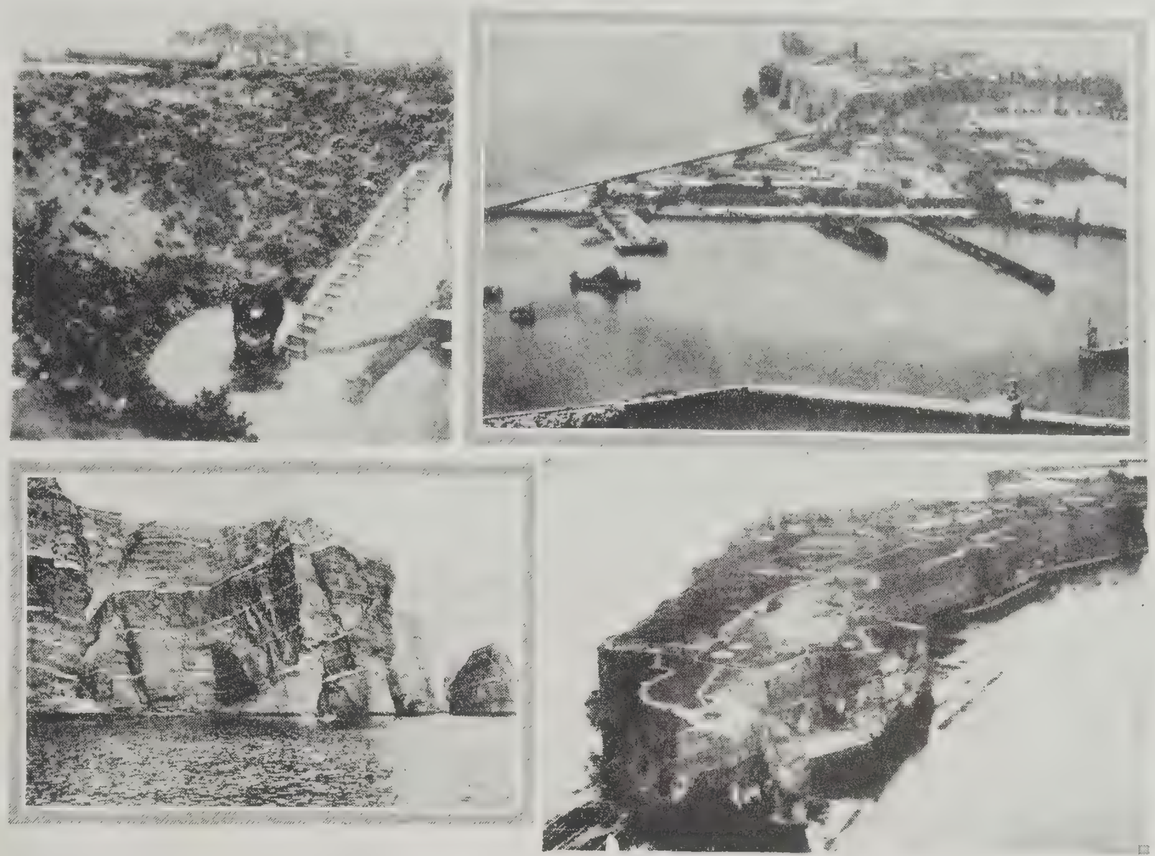
"It is quite probable, almost certain in fact," wrote the explorer, "that this burial cave contains archeological treasures of the highest value. Our archeological researches proved without a doubt that the entire region had at one time been inhabited by the Arhuacos, a tribe of which a small remnant still lives in the Sierra Nevada of Santa Marta. Researches by other archeologists have proved that the Arhuacans were excellent workers in gold and had quantities of gold ornaments, and it will be seen that the chances of this cave containing gold ornaments as well as burial objects of other kinds are very good."

On his return to the camp Mr. de Booy soon found that it would be expedient to get away as quickly as possible. He had difficulty preventing an outbreak of the Indians among themselves following the second Chica feast to which he was a witness. While they offered him no attack, it was evident that the element of mystery had worn off. Therefore he packed up his belongings and started back to civilization with the Indians who had accompanied him. He also obtained some of the Macoas as pack bearers for part of the distance, but they would not go into the village. They left the party a day's journey out in the wilderness, and it was necessary to send the other Indians back for a second load.

Heligoland—"Holy Land" of the North Sea

Once-Famous Fortress Destined to Disappear in Battle With Elements

By WALTER M. WOLFF



Above, left—One of the 30.5 cm. guns and entrance to the underground compartments. Above, right—The former well-protected U-boat harbor which is now a mass of ruins. Below, left—The red and gray stratified formation of which the island is composed. Below, right—Heligoland as seen from the north at low tide.

"ENCHANTED ISLE" should more properly have been the name of a little spot in the North Sea not far off the west coast of Germany. Called "Helig" (or holy) by the Danes who first discovered the island, Heligoland (Helgoland) has not exactly lived up to its name within the last decade, unless it be that of "holy terror." And yet one never forgets the sight of this rocky sentinel of the deep, once having approached it or departed from it. Coming or going, the visitor is awe-struck as he suddenly beholds an island of rare beauty which seems to grow out of the sea like a huge monument—not real and cold, but mirage-like. There is something illusive and dreamlike about Heligoland as it towers aloft, bathed in sunlit fog with the deep blue of the sky above and the blue of the restless sea at its feet. Well-fitted are the words:

"Green is the land,
Red is the rim,
White is the sand—
These are the colors of
Helgoland!"

Topographically Heligoland is a small island but a mile long and a third of a mile wide and towers 160 feet above the sea. The steep and rugged sides display its layers of red clay and sandstone interspersed with considerable Permian limestone. Caves and grottoes are numerous but the top of the island is sufficiently covered over with black earth so that vegetables and long grass for cattle may grow. Trees or larger growth are, of course, impossible.

The people of Heligoland, of whom there are about 2,500, are of North Frisian descent and speak a dialect of their own, although all can and do speak a beautiful High German. Lobster and deep-sea fishing are the important trades of the natives but by far the greatest source of profit is the thousands of tourists who flock to Heligoland from Europe each summer, for the island is a most ideal summer resort in every particular. Within hailing distance of Heligoland proper is a small flat sand dune which is famous as a bathing beach. This sand dune was still a part of the island as late as 1720 but since that time it has to all appearance lost its connection with the former.

One of the most interesting spots on the high mainland of Heligoland is the famous lighthouse, 246 feet above the ocean. The powerful, penetrating rays from the *thirty million candle-power* lamp can be seen even on the coast at Cuxhaven, nearly forty miles away. Every five seconds there is a flash of one-tenth second duration and ships all over the North Sea are able to find their way at night with the help of the huge tower's kindly beams. A second point of interest is the well-stocked North Sea Museum for Fauna and Flora built in 1896 to which has also been added a large aquarium.

Heligoland became a daily byword to Europe during the critical years of the war. Heligoland defied the entire British navy and dared it to pass to move against Hamburg. Heligoland meant more to Germany than her entire High Seas Fleet; Heligoland was the German Gibraltar. The very name itself spelled something mysteriously terrible to the Allied nations—something mightily to be feared and avoided at all costs. And indeed there was just cause to be afraid of this Silent Sentinel of the North Sea, for nothing more dangerous ever grew out of the ocean in modern history.

The result of an earthquake or terrific volcanic upheavals many ages ago, Heligoland ranked among the foremost of natural fortresses. Not only was the top surface of the island heavily armed with long-range guns, but the very bowels became a storehouse for great quantities of ammunition and armament which was invisible from the outside. In addition, the splendid submarine harbor gave Heligoland every advantage so that for the time being it was easily the world's most powerful arsenal. To take it by force of arms during the years 1914 and 1917 would have been practically impossible, which may account for the fact that Heligoland was never so much as disturbed from her peace-time tranquillity throughout the entire period of the war.

England conquered the island from the Danes in 1807 and ceded it to Germany in 1890.

A force of between three and four thousand men, however, kept up a ceaseless vigil to the very day of its surrender to the Allies under terms of the peace treaty. While not being taken away from Germany outright, Heligoland was forced to dismantle and destroy every trace of its former greatness; the harbor was blown up and the twenty-four big guns and howitzers which had never been able to fire a single shot at an enemy were sent away, never again to return. A few rods of trackage, here and there entrances to tunnels which still lead to unknown depths, and bare spots where once stood long, gray monsters with yawning mouths—these are about the only landmarks still left of the Heligoland that has been.

The little island is now left to its fate to battle with the wind and sea. There is nothing to prevent the waves from eating away little by little the soft, stratified formations until even the constant repairing of sea walls and patching up of holes and leaks will prove of no avail against Neptune's onslaughts. Geologists have figured that many centuries may elapse before Heligoland entirely crumbles and is washed away, but the day is coming when only history will remain to tell the story of the once-famous stronghold in the North Sea. Or it may be that some future earthquake will level the island (earthquakes have been felt on Heligoland) in which case Old Mother Earth will have reclaimed one of her long-lost offspring.

Adventuring With Ghosts of the London of Romance

Concluded from page 3

his decision wavered, and he took coach to Tower Wharf; but the water in the river was low and he believed that his movements were being observed. Once again he returned. He attempted to stab himself, but failed in the execution. Then by the help of the buckle he formed a noose of his garter, fixed it about his neck and fastened the other end to the carved woodwork of his bedstead; but two efforts to hang himself failed. He then contrived to fasten the garter to the top of the door, standing upon a chair which he kicked aside. Before he lost consciousness he heard a voice cry three times: "'Tis over!" When he came to, he found himself fallen upon his face upon the floor, and, reeling and struggling, stumbled into bed, where he was found soon after by the woman who had come in to light his fire.

It is better to sit with him in his chambers when he is in a happier mood. He heard a prodigious hammering at his door as he sat reading by the fireside on a November morning. Opening to his visitor, he beheld a most rural figure, with muddy coat and boots. It turned out to be his brother's farmer landlord from Orpington in the beautiful county of Kent. This uncouth but kindly personage produced with difficulty from his greatcoat pockets a pair of fine fat capons. There were feasting and merriment that night, the capons having been dressed at a neighboring tavern and discussed by Cowper and a party of friends to their great contentment.

Passing by number two Crown Office Row, I meet a gentle looking boy coming out: pleasant faced, with clear brown complexion; lambent-eyed; staid in his demeanor; walking with a slow, peculiar swaying gait. Clad with Quaker-like simplicity. It is Charles Lamb, who was born in this building in the year 1775. "I was born," he tells me, "and passed the first seven years of my life in the Temple. Its halls, its gardens, its fountain, its river I had almost said—for in those young years what was this king of rivers to me but a stream that watered our pleasant places?"

Lamb and his sister Mary haunt another of his Temple homes, number sixteen Mitre Court Buildings, rebuilt some hundred years ago. From these rooms he wrote to his friend Thomas Manning: "I prefer the attic story for the air! . . . . My bed faces the river, so as by perking upon my haunches and supporting my carcass with my elbows, without much wrying my neck, I can see the white sails glide by the bottom of King's Bench Walk." I look up: the present building fades away and do I not see the gentle Elia peeping out? Like Wordsworth, "I look for ghosts."

Another famous Charles here haunts the glimpses of the moon, always hastening as if in a hurry to "get there"; many of the children of his imagination also linger in the shadows of the Temple, among them Ruth Pinch, Tom her brother, and John Westlock the man who wooed and won her. Men of the law figure numerously and not altogether felicitously in the writings of Charles Dickens, but it is not very generally known, or at any rate it is usually forgotten, that in 1839 he entered his name as a Student of the Middle Temple.

There is one whom I have seen "alone and palely loitering" in the Middle Temple; Thomas De Quincey, who entered his name as a student here in the year 1808; short of stature, somewhat mean in appearance, but striking withal; childlike; "blue-eyed, blonde-haired, sparkling face," wrote Carlyle, "with the finest silver-toned voice." I have seen this quaint spirit in the Middle Temple Hall, seated at dinner beside Henry Crabb Robinson, the diarist, as he was on the afternoon of June 17, 1812, at the hour of four. De Quincey was very civil to his companion, whom he cordially invited to pay a visit to him at his cottage in Cumberland. He was a friend too of Charles Lamb: those two small men who loom so large to us today. I have seen the two pacing with silent football the moonlit precincts of the Temple.

And who is this tall, stooping, broken-nosed fellow who stops to speak to his brother shades? It is one William Makepeace Thackeray, who, as a young man, read law in the chambers of Mr. William Taprell, first at number one in the aforementioned Hare Court and later at number ten Crown Office Row. But he did not love legal lore, indeed spoke of it quite harshly: "This lawyer's preparatory education is certainly one of the most cold-blooded, prejudiced pieces of invention that ever man was slave to . . . . The sun won't shine into Taprell's chambers, and the high stools don't blossom and bring forth buds." I have met Major Pendennis here on his way to pay a call upon his nephew Arthur who we are told in a certain famous story shared chambers with Mr. Warrington in Lamb Building, which is called by Thackeray Lamb Court. Which chambers the Major's valet, Morgan, described as "raythe a shy place. The lawyers live there, and has their names on the doors." I went there one night and I would swear that I saw those two names upon the doorpost. And there were two women and two children—Ameliar-Ann and Betsy-Jane. Yes, Fanny Bolton, pretty, nervous, fanciful Fanny, and her mother stood under the lamp "and looked up to the third floor of the house where Pendennis' chambers were, and where they saw a light presently kindled. Then this couple of fools went away, the children dragging wearily after them."

And lo!

"What beckoning ghost along the moonlight shade
Invites my steps—?"

A handsome, well-shaped man, apparently some thirty-five years of age, in Elizabethan finery of some splendor; musing as he moves along the garden of the Inner Temple. A player friend with him, a burly figure of a man, who, as they paused beside some briars laden with blossoms, red and white, said: "Will, which likest thou? The red rose or the white? Which wouldst *thou* have plucked?" But Shakespeare answered not.

There are many other ghosts that haunt the Temple; the dark passages and ill-lit stairways and dim chambers are thronged with them. Dumb shades, many of them whose very names have long since been forgotten. The day is done; the moon shines on court and garden. There is silence save for an occasional quick footstep of departing visitor or returning resident. But I am never lonely when I loiter there; I hold commune with the famous dead.

Disagreements and Disappointments Mark 1923

Concluded from page 2

movement and the king asked the rebel general to organize a military directorate, which is a euphonism for dictatorship.

Rivera hurried to Madrid where a rousing welcome awaited him. Parliament was dissolved, trial by jury suspended, a press censorship instituted and a new ministry formed with Rivera as the sole chief of administration. His first bid for popularity was a declaration that he would hang profiteers if necessary to reduce the prices of food and other necessities.

His next task seems to be the reform of the civil service which is overburdened with costly sinecures.

The success or the failure of the new Spanish venture can be determined only by trial. The Spanish people are said to have accepted it as promising to be an improvement upon previous régimes.

Brief mention only can be made of other discords that have marked the passing year. In Bulgaria in July a military revolution overthrew the ministry of the peasant premier, Stamboulisky, and fearing the fate of former premiers who had been imprisoned and otherwise punished for official acts, Stamboulisky fled from Sofia. He was pursued and captured and on July 15 was shot and killed.

When, on May 6, Chinese bandits wrecked a train in Shantung Province and captured a number of Europeans and Americans, holding them for ransom, the government at Pekin was powerless to deal with the outrage, and release of the hostages was finally effected by independent negotiators who, it was understood, were empowered to offer the brigand chieftains commissions in the Chinese army.

The affairs of the Chinese Republic have been chaotic throughout the year, but in October General Tsao Kun was chosen president, being inaugurated October 10. But China is not unified. Dr. Sun Yat Sen has re-established his government at Shanghai and warns the powers against President Tsao Kun. Both governments have strong foreign backing and the struggle seems destined to continue for considerable time.

England Weathering Storm

IRELAND, of course, connotes disagreement. Discord has persisted there aplenty. Guerrilla warfare continued until April, when De Valera proposed a peace pending the coming elections. In the main this pact was kept, but the Free State authorities arrested De Valera when he rose to address a political meeting on August 15. The elections on August 27 resulted in victories for the Free State, though their predominance in the Dail depended upon a coalition with the moderate and independent parties.

On September 10 the Free State was regularly admitted as a member of the League of Nations and the Dail opened without disorder in October.

The Republicans both in Ireland and America, however, are by no means pacified and many men elected to the Dail refused to qualify by taking the oath of allegiance to the British Crown.

Of all the countries that entered the war at the outset, England has best weathered the storm and best maintained her foreign and domestic credit.

The strain, however, has been great and is growing heavier. The care of her war victims has taxed her resources and the unemployment conditions have long been acute.

Free trade has been the traditional policy of England and the average Briton has a wholesome regard for tradition, but so acute is the situation that the Conservative government of Stanley Baldwin has brought about the dissolution of Parliament and the call for new elections.

The Liberal and the Labor parties oppose the proposition and the former premiers, Lloyd George and H. H. Asquith have composed their individual differences to give added strength to their opposition.

Baldwin and the Conservative platform went down to defeat early in December and as these lines are written the question of whether the Labor party shall be permitted to organize the government, or whether a coalition government is to be attempted, has not been settled.

As this is largely an account of disagreements, reference to our own has been reserved to the last because we have not had many of a major sort this year.

On the other hand our chief event has been one of national sorrow. On August 3 President Warren G. Harding died in San Francisco after a brief illness from which he was believed to be recovering.

The shock deepened the sorrow and a nation paused to honor his memory as his remains were borne across the continent and to his last resting place in Ohio.

Political disagreements, even then acute and growing bitter, lost their rancor and a period of uncertainty followed which was not relieved even when Congress met in December to hear the policies of his successor.

The Coal Strike Threat

BUT in other fields, aside from the matters of prohibition enforcement and agitation as to our duty to enter or remain aloof from foreign entanglements, our year has been rather normal.

The anthracite coal strike threatened to become a serious industrial disturbance but although the mines were closed by a walkout August 31, Governor Gifford Pinchot, of Pennsylvania, the only anthracite-producing state, after appointment as a special commissioner by President Coolidge, negotiated a settlement on the basis of an increase in wages to the miners.

It was his contention that the increase would add but sixty cents a ton to the costs of production and that this could be absorbed before the coal reached the consumers. That such could or would be the result was a matter of doubt since settled in the negative.

The other painful event of the year was the clash of Governor J. C. Walton, of Oklahoma, with the Ku Klux Klan of that state. The governor found himself in conflict with the society early in the summer and the contest was highly dramatic while it lasted. He attributed frequent bits of mob violence to the Klan and began vigorous prosecutions resulting eventually in the declaration of martial law throughout the state on September 18. A few days later the legislature attempted to assemble with intent to impeach him but he employed his militia to block the effort. On October 9 the voters of the state carried an amendment to the constitution authorizing the legislature to assemble upon their own initiative. This was promptly done, the house impeached the governor and the senate, as a court, tried him and sustained the impeachment November 20, after the defendant had left the senate chamber and refused to make further defense because, he asserted, the court was biased against him.

To offset these untoward happenings, much transpired during the closing year that makes for domestic and international amity. After a long suspension of diplomatic intercourse with Mexico, the United States negotiated a pact whereby friendly relations were resumed. The agreement was reached by representatives of the two countries on August 15 and on August 31 this country formally recognized the Obregon government. Early in December the stability of the Obregon administration was seriously threatened by the flaming up of a revolt.

The possibility of a breach between this country and England over the repayment of war loans to the Allies was averted earlier in the year when an agreement was negotiated whereby the United Kingdom pledged itself to liquidate its debt of nearly five billion dollars by annual payments for sixty-two years with interest at three per cent for the first ten years and three and one-half per cent thereafter.

This agreement was ratified by both governments and England made the first payment on March 15.

Last year there were many misgivings as to the fate of the pacts formulated by the Washington Conference for the Limitation of Arms and the settlement of Pacific and Far Eastern questions. The Conference met in November, 1921, and adjourned the following February, but at the close of 1922 neither Italy nor France had ratified the treaties. Italian ratification took place in February and in July France completed the necessary legislation. Representatives of the signatory nations met in Washington and formally exchanged the ratifications which put the pacts into full force and effect.

After at first declining the American request that to protect our Atlantic seacoast from the wholesale smuggling-in of contraband liquor the traditional three-mile limit of terrain jurisdiction be stretched to twelve for this specific purpose, England has recently assented with qualifying restrictions and before the end of the year this agreement will be ratified.

If more than a mere suggestion of pessimism seems to have crept into this narrative of the year's larger happenings, now is the time and this is the place to stress the assertion that the outlook is not so gloomy as might be inferred.

The deadlock in the Ruhr and the imminent collapse of Germany must, of course, be a matter of deep concern to every thoughtful person and until this complication is straightened out no world restoration is possible.

An Economic War

THE Franco-German struggle, however, has taken on the aspects of an economic war in which not even the victor can continue the fight indefinitely. Distressful as is Germany's present plight history testifies that she recuperates quickly and her eventual rehabilitation may be brought about under conditions that will preclude the possibility of her national energies again being wasted in warlike ventures.

It is reported that the element now dominant in Turkey realizes the value of her natural resources and is determined to make their development benefit the country. If this be true, her return to Europe may not prove an unalloyed calamity.

If ever there was an incident which, but a few years ago, would have made war inevitable, the Corfu affair had all the elements but zeal for national expansion stopped one degree short of that insanity which in times past has led many a people to imagine themselves invincible and favored by the co-operation of Deity.

Even the outstanding calamity of the year, if not of the century, the Japanese earthquake and fire of September 1 and 2, involving a loss of approximately 200,000 lives and a property damage beyond computation, seems destined to draw us into closer association with that oriental people, to establish relations of enduring friendliness and mutual security.

If such a disaster can bring with it incidental benefits it is more than likely that at a future that will give us sufficient perspective we can look back upon the year 1923 as one of achievement and progress.

Farmers and the Credit System

By A FARMER'S WIFE

THOSE who advocate increased credit facilities for farmers are, evidently, unacquainted with the ways of country people.

The average farmer would be much better off if he were unable to obtain credit.

He cannot seem to realize his obligations when signing a note. No matter how much he owes, any ready cash he gets by selling cows, cream, pigs or poultry, he looks upon as his own to spend as he chooses, irrespective of "the paper" he has out against him.

Even educated farmers are prone to let things slide with a childlike faith that a good crop or a raise in prices will bring them out all right.

There is no end to the money that people can spend on a farm in improvements and labor-saving devices, and the countryman is, usually, the prey of every glib-tongued agent that comes along. If he can buy anything "on time" he appears to think he is getting it for nothing—until the day of reckoning arrives.

Most farmers are land poor. In their desire to be considered rich and important in their neighborhood, farmers pay taxes on and try to cultivate more land than they can afford to buy the equipment necessary to do it well. Although they may realize in the abstract that it is better to get twenty bushels of wheat an acre off fifty acres than ten off a hundred, they prefer to tell that they have "a hundred acres in crop," it sounds bigger.—So they borrow money for the extra equipment and nine times out of ten come to grief.

If they couldn't borrow the money, they would be obliged to curtail their soaring ambition.

A man will take up a homestead, break the sod and sow wheat. The first crop, with ordinary weather conditions, is generally good, as wheat does well on sod-broken land. He may get thirty bushels to an acre. Fifteen hundred bushels from fifty acres looks big to him. He reasons three thousand would be better, so puts in a hundred acres. To do this, he may borrow a thousand dollars for extra equipment, but that wouldn't be enough, so he has to stubble his first fifty acres which will probably not yield under that treatment more than ten bushels.

The bank will probably send him a notice at the end of six months that he owes $1,050. He tells them they must wait until after threshing time which gives him another six months, when he will owe $1,105, but if wheat is low and other bills press, he will probably get the note renewed again. In the Northwest, the banks usually renew the notes adding the *ten per cent interest compounded semi-annually* until they decide that the borrower's assets will not cover his liabilities when they —close him out.

Then, and not until then, does the average farmer seem to realize what signing a note means. Probably, at first, he could have paid the interest by economizing closely and not allowing his family to spend all the money he got for his hogs at the county fair.

County fairs, undoubtedly, are incentives for raising better farm produce, but most of them might be better managed. For instance, concessions should not be given to cheating, gambling games where a gullible rustic can drop five dollars in as many minutes. Farmers, like poets, seem totally lacking in the business instinct. For an example, one year during a drought in the Northwest, instead of selling their cattle, and using the money to buy hay for their work horses and a few milch cows, the ranchers borrowed money to buy hay at exorbitant prices, with the result that most of them went bankrupt.

If they had been unable to borrow the money to buy hay, they would have been obliged to sell their cattle and, probably, remained solvent.

What farmers really need is adequate marketing facilities. Some way could and should be devised so that farm produce could be more evenly distributed. When eggs are selling for ten cents a dozen in some localities and forty cents at the same season elsewhere, something is radically wrong and should be remedied.

Farmers are not financiers, but, even if they were, they could not make money if obliged to sacrifice their wares as they are doing at present. Extended credit does not provide a market for the farmer which is the one thing needful to a satisfactory solution of the Agricultural Problem.

When the Grain Growers' Association came into being many ranchers in the Northwest hailed it as a means of salvation, but they were doomed to disappointment. Those who joined received sixty cents a bushel for wheat at threshing time with a promise of two more payments. At the last payment in May, those who joined the association received eighty-three cents for dark, hard winter wheat, and eighty-nine for Northern Spring, while the ranchers who sold to the elevators received more than ninety cents for winter wheat and more than a dollar a bushel for spring. The officers of the Grain Growers' Association made excuses, but the fact remained that the farmers, who put faith in them, lost money.

Probably there were too many farmers in the association, and not enough business men.

Farmers as a class are not able to compete with sharp-witted city business men.

If city people and financiers, instead of trying to exploit their country cousins, would do all in their power to aid them, we should not have such an appalling and menacing agricultural situation.

Farmers don't need credit, but cash, or an opportunity to sell their wares and labor for what they are worth.

Introducing Lue Gim Gong, the Chinese Burbank

His Horticultural Triumphs Mean Extra Millions to Florida Citrus Growers

By GEORGE H. DACY

Right—LUE GIM GONG, who has done for citrus growers more probably than any one orchardist in America. Here he is seen standing near one of his famous grape fruit trees; in the oval he is with Fanny, his beloved 31-year-old horse; at the left Lue is holding his rooster, which, when he died, was petrified by Lue and is cherished to this day.

ORIGINATOR of two of the best varieties of grape fruit and oranges cultivated in Florida and California and propagator of a remarkable cherry currant, a delicious grapefruit that yields a perfume, an early sweet apple that ripens about Independence Day in the latitude of Central Massachusetts and a peach which grown under glass bears luscious fruit in November, developer of a three-leafed orange which will mature as far north as Connecticut and breeder of the finest family of tomatoes raised in North America, Lue Gim Gong, of De Land, Florida, is a veritable Chinese Burbank and the most skillful pollination expert in the state of our last frontier. Some time or other every grower of citrus fruits in the United States has heard of Lue Gim Gong. Most of the leading orchardists have visited this well-educated, Americanized Chinese. Not a single visitor of the hundreds of thousands who have called on Lue has failed to learn something from this charitable patron of growing things whose greatest pleasure is to assist the other fellow in mastering the intricacies of the citrus industry.

My visit to Lue Gim Gong will always be a treasured memory, for it was fraught with experiences such as seldom fall to the lot of an itinerant free-lance writer. In going to Lue's grove, about two miles from De Land, I took an automobile short cut through the woods and thus became intimately acquainted with one of the most curious motoring paths in all creation. The roads of Florida that are not paved are impediments to automobile traffic because of the treacherous sand which in many respects is as objectionable to gasoline travel as the hub-deep spring mud of the Corn Belt or the blizzard-bound prairies of the Northwest. But forests of towering pines furnish the natives of Volusia County with a most extraordinary roadway topping in the form of soft pillows of pine needles.

Nestling cosily amid its bower of tropical shrubbery stands Lue Gim Gong's house, the library of horticultural study, the laboratory of complicated search and research where for more than a half-century, night after night, the Chinese wizard of pollination has burned midnight oil to solve the riddles which jeopardize citrus production. The rooms of the house and even the front veranda are piled high with technical and scientific periodicals. If ever a man devoted his entire life, unstintingly and unsparingly, to humanity, that man is Lue Gim Gong. He has traveled far in his studies. Universally all citrus people sing his praises. Notwithstanding, today this talented Chinese is practically penniless and dependent on the bounty of his friends. Like many another genius, Lue was a poor business man. Unscrupulous interests have robbed him of his discoveries and horticultural treasures. Even his home orchard and farm are heavily mortgaged. Were it not for the intervention of his friends who organized a company to rescue his estate from the hammer of the auctioneer, Lue would be without roof to shelter him in his crippled old age.

Lue Gim Gong's outstanding contribution to twentieth century horticulture is an almost magical orange that is named after him. On the basis of present market likes and dislikes, the Lue Gim Gong orange is one of the most popular grown in Florida. The marvelous feature about this variety of orange is that the fruit after attaining full maturity will hang on the tree one, two, three, even four years or longer without deterioration. In case the market is glutted at the end of the initial growing period when the oranges are ready to pick, the grower can let them hang on high until the readjustment between supply and demand has restored normal prices. Then the grower can pick, grade, pack and market his Lue Gim Gong oranges. If he does not wish to sell that season, he may let the fruit hang on the trees until the second season and then harvest a double-header crop. If he wishes, he may leave the fruit of the first two seasons in storage on the trees that grew them and wait until the third crop is ready for picking.

The writer carefully inspected a number of the Lue Gim Gong orange trees that had not been harvested for three years and which also showed the blossoms of the fourth crop. The sweet-smelling blossoms of the new crop were just beginning to unfold. The oranges that were one year old were a rich lemon color, and, although ripe, still clung tenaciously to the branches where they were suspended, from which no ordinary windstorm could detach them. Interspersed among them were larger and darker colored two-year-old oranges that still felt sound and firm to the touch and when opened showed no evidence of deterioration. The three-year-old fruits were dark brown in color and almost as large as small grapefruit. They also were compact, perfect, juicy, succulent and appetizingly edible. The Lue Gim Gong orange trees are very resistant to the occasional visitations of Jack Frost. These trees withstand temperatures ten degrees colder than those of other varieties.

Lue Gim Gong showed me an interesting experiment he had conducted to ascertain the frost resistance of the grapefruit trees which are named after him. The ordinary varieties of grapefruit trees bore no fruit; several severe freezes had put them permanently out of business. The Lue Gim Gong trees were growing healthily and producing profitable crops of large luscious grapefruit. The Lue Gim Gong grapefruit will withstand weather fifteen degrees colder than will ordinary citrus crops of this description. This variety ripens two months earlier than ordinary and bears fruit in clusters.

The South Florida Winter Fair held annually at Tampa is one of the best citrus congresses in existence. When Lue Gim Gong has exhibited oranges, grapefruits and tangerines that bear his name, he has won the premier prizes. Even Uncle Sam has seen fit to reward Lue for his original investigations in citrus fruits and his development of valuable new strains. Hence Lue, with pardonable pride, treasures a fine gold medal which the United States Government gave him when he perfected his famous Lue Gim Gong orange.

I was prepared for most any surprise but I was amazed when Lue said, "Now we will go to the chapel for a little prayer." A prayer meeting in an orange grove! We walked to a beautiful spot in the grove where the overlapping branches of four magnificent orange trees formed a natural chapel with a green-vaulted dome perfumed with the sweet scent of orange blossoms.

In this arbor were several benches and a simple little pulpit that Lue had built. Here every morning, and ofttimes during the day, the devout Chinese, who has long been Christianized, holds homely services. About 5,000 to 6,000 visitors call on Lue every winter so that he usually has a congregation of sight-seers who join with him in his simple service.

In Canton province, China, where Lue Gim Gong spent his boyhood days, his parents were agriculturists and expert plant breeders. The boy inherited the parental love for growing things and at six he was interested in and expert at pollinating lettuce, radishes, turnips, rice and other produce of the Chinese gardens and houseboat hotbeds. When he was twelve, his parents sent Lue to San Francisco to an uncle who had established himself in business at that port. Lue made the trip with five other Chinese boys and men and despite that he was the youngest of his party he was soon their leader, for he knew more about traveling than any of his mates.

After a year in San Francisco, Lue's uncle sent him to North Adams, Massachusetts, where the boy worked for several years for Solomon Burlingame, a farmer of that neighborhood. Finally, Miss Fanny Burlingame, the daughter of the house, adopted and educated the Chinese boy. Discovering his love for growing things and his ability to cross and develop valuable new strains of old varieties of crops, she furnished him with every facility for his study and experiments. It was under the sponsorship of his foster mother that Lue developed one of the finest tomato plants ever produced in North America. It attains a height of fifteen feet and bears heavy yields of fine, clean fruit that never comes in contact with the ground. The cherry currant, a cross of the grape and the cherry, and the remarkable apple and peach that have been mentioned previously, were also varieties that Lue Gim Gong perfected in Massachusetts.

Lue Gim Gong loves dumb animals. His veteran horse, Fanny, an old maid of thirty-one calendars, follows her master about like a pet dog would. And Lue's chief concern at present—the old Chinaman has celebrated his sixty-eighth birthday and is so crippled, due to falls from trees, that he can barely totter about—is to see that Fanny has plenty to eat and drink. Years ago, there was a third member of the trio—a defiant, strutting rooster that recognized only one superior, his master. According to rumor, Lue taught this bird to sit on the back of a chair as he ate his dinner. The Chinaman would toss bread crumbs to the bird. The rooster died about ten years ago and Lue—skilled in the arts of the Chinese chemist—petrified the body of his feathered pet and today treasures it as one of his cherished possessions.

There was a time not so long ago when the Lue Gim Gong crops of oranges and grapefruit sold for from $6,000 to $7,500 a year. Now Lue gives most of his fruit away to visitors. He is too old and feeble to operate his grove on a commercial scale. He is unwilling to turn it over to others. His friends will hold the place for him as a homestead as long as he lives that he may be comfortable.

Once a famous mining engineer said to the Chinese orchardist, "Lue, why in the world do you waste your time fooling away trying to produce new varieties of flowers, plants and fruits? With your ability you could win a fortune in the fields of commerce and industry." And Lue answered, "To my way of thinking, the creation or development of a new product of horticulture is worth as much to humanity as a great industrial discovery or the perfection of an intricate machine. If I can add a single iota to the happiness of humanity, I will be satisfied."

Lue Gim Gong has lived in pathetic isolation for many years. He has only visited the city of De Land three times in eighteen years, notwithstanding that the round trip is less than five miles. He has given his all to the cause of better fruit for America. He is not an alien who sends all his earnings back to the land of his nativity. He gives all he gets to his American friends. He is loyal to the United States, being adopted by an American family more than five decades ago and educated in the same kind of schools as the average American boy. His manhood has been that of a highly valuable supporter of the Stars and Stripes. His brain and vitality have been wearied in the service of his adopted state. His great reward is his satisfaction that he has accomplished something worth while for Florida and that he has erected a monument which will defy the attacks of the ages.

UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

A pioneer West Texas banker has the unique record of having been a sheriff for ten years in a Texas county when the West was really "wild," and never having carried a gun.

A memorial tablet in memory of Alexander Selkirk, the real Robinson Crusoe, was erected on the island of Juan Fernandez by the officers of H. M. S. *Topaze* in 1868. It reads, "In memory of Alexander Selkirk, mariner, a native of Largo, in the County of Fife, Scotland, who lived on this island in complete solitude for four years and four months. He was landed from the *Cinque Ports Galley,* ninety-six tons, sixteen guns, A. D. 1704, and was taken off in *The Duke,* privateer, 12th Feb. 1709. He died lieutenant of H. M. S. *Weymouth,* A. D. 1723, aged 47 years." It is set into hard rock in a beautiful spot about 1,700 feet above the sea, near Selkirk's Lookout.

The lowly prune, the butt of paragraphers and the inspiration of boarding house wit, has come into its own. California devotes $200,000,000 worth of acreage to prune-growing and exports $25,000,000 worth of prunes annually.

King Tutankhamen's 3,000-year-old tomb will be opened to the public some time in January. Visitors holding tickets may enter when they will not hamper the work of the scientists.

A mummy hunter who "speared" for Inca mummies in the drifting sands of Peru taught the prohibition agents of Florida how to uncover rum caches. Great liquor stores were discovered in the sea-washed sands of Florida by running a sharpened iron rod into the beach. Several rods are now being used.

The ranges of the National Forests supported around 2,000,000 head of cattle and 7,000,000 head of sheep, not counting calves and lambs, during the current year, says the Forest Service, United States Department of Agriculture.

The Boy Scouts of America have a fund of $100,000 to develop the Boy Scout magazine, *Boys' Life.*

A remarkable stone wall built in the form of a fortress on the top of a Georgia mountain south of Lookout Mountain, Tennessee, is believed to be of pre-Indian origin, as the Cherokee Indians told the first white settlers that a strange white race were in this vicinity before them. A walled-up spring is near the opening gate. There is not a civil engineer in America who could improve on its construction as a fortress defense.

The ancient "city of David" is to be excavated by archeologists.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Voters in Czecho-Slovakia are punished by a fine of not less than twenty Czecho-Slovak crowns nor more than 500 Czecho-Slovak crowns for their failure to appear at the polls on election day. In certain extreme cases excuses are accepted.

A new taxicab in Paris accommodates a single person in a seat—about twenty-eight inches wide—and charges half the price of an ordinary taxi.

Leprosy had its origin in Central Africa, and thence it spread to Asia. The hordes of the army of Darius brought it to Europe and it was taken to the Americas as an accompaniment of Negro slavery, according to a writer in the London *Quarterly Review.*

Amoy, a city of 120,000 inhabitants in Southern China, has no picture shows.

President Coolidge has no brothers nor sisters.

The physical education department of Northwestern University will have a three-hour course in walking. The object of the classes is to teach the proper poise while walking.

"That the troops may have an opportunity of attending public worship, as well as to take some rest after the great fatigue they have gone through, the General in future excuses them from fatigue duty on Sundays, except at the shipyards, or on special occasions, until further orders. The General is sorry to be informed that the foolish and wicked practice of profane cursing and swearing, a vice heretofore little known in an American army, is growing into fashion . . . . It is a vice so mean and low, without any temptation, that every man of sense and character detests and despises it."—*George Washington.*

Japan's loss by the earthquake, at first figured at three billions of dollars, has been scaled down to about one billion.

The Jewish Daily *Forward* has the largest circulation of any alien language newspapers.

Unparalleled blow-downs in the tropics account for a banana shortage to date this year of more than 5,000,000 bunches.

The British are at work in India on an irrigation work twice as large as the Panama Canal and costing one-sixth as much.

"Your leaders who tell you that the more a country is Christian the worse it is for the Jews are mistaken. Wherever you find the Jews prospering most you will find that it is a Christian country. Look where the Jews are! Can you find many Jews where there are no Christians? Where do the Jews strive to go when they emigrate?—to America or England, the two Christian countries where the Bible is studied more than in any other lands on earth."—*Jacob Gartenhaus,* a Jew.

French telephone subscribers who become angry with the operators may be suspended for two days from use of the service according to a decree issued by the Ministry of Posts and Telegraphs.

A French aviator drove his airplane nearly seven miles up from the earth, breaking the altitude record made in America recently, by Lieutenant Macready.

What is believed to be the first rubber pavement in the United States has been laid on a railroad crossing in Racine, Wisconsin. The section of rubber paving will be given a severe trial at this crossing used by thousands of automobiles and heavy motor trucks each day. A similar pavement in Princes street, Edinburgh, has been used for more than twenty years, yet it has lost only a fraction of an inch in thickness during this period.

FIVE YEARS OLD—600,000 CIRCULATION

In the short space of five years, THE DEARBORN INDEPENDENT has become the world's foremost non-fiction, fact-giving weekly. It is being read in hundreds of thousands of American homes every week and is doing its part toward developing those standards of living and government which will insure continued welfare and prosperity for our country.

Preaching "Tolerance," Producers Encroach on Decency

CHRONICLER OF THE NEGLECTED TRUTH

Mayhap Something Will Come o' This! Who Knows?

No Year Like 1924 to Attempt a Reform as Badly Needed as This; If Move to Check Conditions Isn't Made, What Is to Become of Vocabulary?

By MARK V. O'NEILL

PROBABLY you read the advertisements in the magazines. I know that I do. And probably you don't believe quite all that you read in them. I know that I don't.

I believe the illustrations when they are photographs. When they are what the advertising men refer to as "art work," my birthplace begins to shift to Missouri.

As for the copy, text, reading matter, or whatever you want to call it, I am frankly hard boiled.

There are plenty of good reasons for this.

One of them is that national advertising is drugging itself into a coma with habit-forming superlatives.

The quail-a-day man wasn't in it. Advertisers have been feeding us a diet of adjectives so rich that they would make quail taste like a crust of bread and a glass of water.

Ten years ago if William Jones invented a new style wimwam for a goose's bridle, he was content to burst into print with a quarter-page ad setting forth the hypothesis that the Jones Patent Wimwam was the best one on the market at any price. When Bill said that he was all through and at the end of his descriptive tether. He remembered the red schoolhouse days of good, better, best. "Best" sounded to him like the ultimate assertion, and he was content to stand or fall by it.

It's Super-this and Super-that

BUT best doesn't amount to shucks any more. Advertising, in its headlong rush through the last decade, has long since discarded such feeble language and modest claims. It is no longer considered good form to content yourself with merely remarking that what you make or sell is the best of its kind. The best is not nearly good enough, from the advertising man's viewpoint. Super- or hyper- best is the very least that the advertiser may hope to get by with. In these days of advertising ballyhoo and adjectival intoxication, such a modest superlative as "best" would be as out of place and lonesome as an American on Broadway.

To make this plain we have only to take William Jones and move him and his wimwam from 1913 up into 1923. This is what would happen. Instead of attempting to write his own advertisement, William would go to an advertising agent and explain that he was in with a new wimwam. In a week the wheels would be going and in a month we would open a magazine to receive a full page in color directly between the eyes.

The Case of the Wimwam

AT THE top of this page would be a more or less correct representation of a luxuriously furnished living room in what was plainly an expensive habitation. They're always expensive looking. A young woman in abbreviated clothing would be discovered staring joyously at an object in her hand while a male person with his hair brightly oiled would stand a trifle up center and contemplate her with an expression of benevolent satisfaction, as of ducks that die in tempests. Wifey and hubby, of course. The caption under the picture confirms your suspicion. It says, "O, George, how perfectly dear of you to buy me this lovely Jones Wimwam. It's just what I wanted!" At the bottom of the page would be the hand-lettered signature, Jones Wimwams, Incorporated, Boston, Chicago, San Francisco. And the slogan in quotes, "Jones on a Wimwam means what Sterling does on Silver." Between the picture and the signature would be the copy. It would read something like this:

Fifty years ago, in a small country town, William Jones made the first Wimwam in this country. Crude it was, of course, and ugly. But this unpretentious model embodied the germ of an idea that was destined to revolutionize the social and commercial life of a nation, and foreordained to grow into the mighty and magic Wimwam industry of today: an industry which is at once the wonder and despair of the entire world.

For half a century we have kept faith with the Wimwam-buying public of America.

And the results and advantages of our years of Wimwam research and laboratory experiments are placed at your disposal in our latest offering, The Jones Superbo Wimwam de Luxe.

Do not be imposed upon by the manufacturers of cheap and inferior Wimwams. The Jones will cost you a few cents more in the beginning but dollars less in the end.

"What will it do?" you may ask.

It will heat your home, soften your beard, make you a Traffic Manager at $10,000 a year, remove the film from your teeth, teach you the secret of making people like you, keep your hair combed, prevent you from making embarrassing social mistakes, and enable you to sit comfortably at home and hear the world's greatest singers, lecturers, after-dinner speakers, saxophone players, and bedtime story-tellers.

Can you ask for more? Can you do with less?

Take this beautiful new Wonder Wimwam in your hand. Notice the friendly hang—the perfect swing and balance of it.

Put it in your living room and see how marvelously it harmonizes with the rugs, draperies, furniture, and fireplace.

Set it up in your cellar and remark the rugged, cheerful way it blends with the furnace and the coal bin.

Finally, slip it into your vest pocket and observe its lack of bulge and weight, and the well-tailored, modish look it gives to your trousers.

Magnificently marvelous: superbly wonderful; amazingly supreme—surely this is the Super Wimwam of all time!

Man, you can't live without it.

Get in today on our glorious, no-money-down Wimwam Sales Plan.

Do not send us a red cent. Clip the coupon, fill in and mail to us. Deposit $5 with the postman when he brings it to your door and the Superbo Wimwam is yours.

OBEY THAT IMPULSE! DO IT NOW! TODAY!

And so it goes, week after week and month after month in the back pages of our best and our poorest magazines. When we fail to respond to the old bromides, the advertising expert patiently cleans out his hypodermic, jams a fresh assortment of adjectives and superlatives into the barrel and shoots the charge home with a double-page spread. For a few days the public is incited to another buying debauch and the fever charts in the sales manager's office begin once again to look like a rotogravure of New York's well-known sky line at night.

Plays Hob With the Patient

BUT this constant use of the needle is playing hob with the patient. One of these days he is going to turn on his doctors and nurses, and do some thinking for himself. That will be a sad day for the boys in the advertising "game," and for those publications that depend upon them for support.

The advertising of the motion picture producers is a thing to make the angels weep, and the average man would no more think of swallowing it than he would think of believing what he read in a metropolitan newspaper.

Book publishers are a close second when it comes to the dissemination of what the untutored consumer calls "bunk."

After these two offenders come the shaving cream men, the dentifrice manufacturers and the correspondence schoolers.

Hosiery, breakfast food, and pharmaceutical advertisers are ridiculous and extravagant, but only mildly so.

Now it would be a sadly misinformed, as well as a reckless, man who would attempt to infer from these statements that there is anything wrong with advertising *per se*. It's as right as rain and as necessary in business as bootleggers are in New York City. And that is almost the last word in necessity. *The trouble is not with advertising, but with those who buy, sell, and make it.* In this, as in so many other things, the defects of the majority have set the pace for all.

Advertising Itself Oversold

ADVERTISING copy writers and the men who are employing them are working on the fallacious theory that the buying public is composed almost exclusively of male and female morons. This supposition does us less than justice. We may be gullible but we are not all Gullivers, in that we have not his singular and praiseworthy docility of disposition.

It is a curious fact that just as countless products have been oversold by razzle-dazzle advertising that they could not possibly live up to, so has advertising itself been oversold to advertisers. Its most ardent practitioners, the agencies, are running up against this condition almost daily, and they are continually striving to overcome it by such catch phrases as, "Don't expect advertising to do it all"; "Sales effort and distribution are up to you. All advertising can do is to direct attention to your product." This back fire is the direct result of the advertising agencies having sold advertising so hard in the days before the check-up and show-me period, that the client has come to think that all he has to do is to pay for a few full pages and presto! his sales problems are all solved. Here are chickens returning to the old homestead for roosting purposes with a vengeance.

This may seem like putting the bee upon the agencies with undue violence.

But inasmuch as almost all of the advertising that finds its way into print is prepared by these same agencies, to them must fall the praise for what is good and the censure for what is otherwise. They are responsible for omissions as well as commissions: the former occasionally, the latter constantly.

An Agent in Action

I HAVE known many men in the advertising business and have numbered among them both acquaintances and friends. I have broken bread with wily account executives and humble copy writers, commercial "artists," and layout men. They have been truthfully and classically described by one of their own craft as a fine body of men.

They have, though, one fault. To keep their respect, or even their tolerance, you must believe as they do and with the same degree of childlike optimism, if so fatuous a theory may be dignified by so inspiriting a word.

For advertising men practice what they preach. To them the world is rosy and we are all bound for some commercial heaven in our own private and personal hack. The taint of synthetic enthusiasm and heady hyperbole is in their blood ready to break forth at the most casual provocation. Let the client essay but a timid, "Don't you think—" and he is forthwith made to realize how very feebly the waters came down at Lodore.

An advertising agent in full war panoply is a thing to strike terror to the heart of the most stalwart. He creeps into the lair of his unsuspecting client entrenched behind the advantages of technique, statistics, trade lingo, and tailor-made clothes.

From a sporting standpoint, the client never has a chance. The first three exchanges demonstrate the superior acumen of the agent and from then on the client is as putty in his febrile and facile hands. Nine advertising managers out of every ten are but rubber stamps, roar they never so loudly and strut they never so proudly in the account executive's absence. One glare from his horn-rimmed glasses and they sit up and bark for copy or lie down and roll over for art work.

All of which is offered by way of proof that the final blame for our present blaring, flaring, system of national publicity is less traceable to advertisers than to the advertising fraternity.

The Remedy Offered

AS FOR the copy writers, it is not fair to judge them by their output. They are mild and harmless as a class. They are without literary aspirations and frequently do not know whether O. Henry is an expletive or the name of an author. The young of the copy writers, like that of the Canadian jay, is rarely seen in the haunts of men, but it is an accepted fact that advertising copy writers have married, reared children, and demonstrated in other ways that they are assimilable and capable of making exemplary citizens.

This is more important than it may appear because it is largely to the anonymous copy writer that we must look for future improvement in the tempo of advertising literature.

Let me return, in closing, to my original contention that national advertising is immodestly hectic and unnecessarily violent.

Hard things are properly said of any man who criticizes without making suggestions for bettering the object of his criticism.

If I could stand on a suitable platform with a small table and an inevitable pitcher of water at my elbow I would like to magna vox myself to the advertising agencies of the country thus:

"I represent the Society for the Prevention of Cruelty to Advertisement Readers. In the name of this Society I ask that you give the Consumer a chance and a change. Take him off his present diet of bombast and ballyhoo. Give him a little sober truth and unseasoned fact. Continue to be enthusiastic, but mingle with your enthusiasm a little reasonable restraint. Segregate your intellect from language, rhetoric and miscellaneous parts of speech. Pass up syntax and concentrate on brass tacks."

The Changing Standards of Children's Books

McGuffey Readers First Juvenile Works to Humanize Elementary Education

By ARTHUR G. WALKER

I RECEIVED a child's weekly today and mentally compared it with the first books we knew as children, the crude pages and pictures—to memory now so precious, as they were then to imagination so satisfying.

In a city store I handled new copies of children's periodicals, wonderfully colorous, their very touch stimulative of good taste in printed things—*St. Nicholas, Chatterbox, John Martin's Book;* the fine editorial of the children's classics; Mother Goose Rhymes, "Robinson Crusoe," Hans Christian Andersen, and Barrie's "Peter Pan," among the multitudes of treasures. What pictures! The best artists here do their most characteristic and most beautiful work. The very best in bookmaking in this bookmaking age, all poured out with the greatest prodigality by the senior members of the fraternity for the happiness of the juniors. Thinking of all this treasure my mind slipped away to those whose first efforts added the fellowship of knowledge and art to the knowledge of nature. The pioneers we find long before the invention of printing. Theodore of Tarsus and his establishment of a school on the coast of Kent, in the seventh century; Bede and Alcuin in the north of England at the same period. Then there were the Books of Courteisie of the Middle Ages, got up for the training of the souls of the nobles.

But it was the invention of printing and the making of books in the modern way that opened the treasures of the mind and heart to the boys and girls of Europe, and then to the boys and girls of the world.

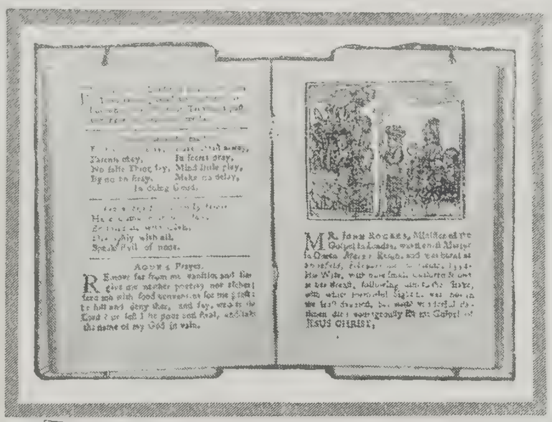
It may not be generally known that the invention of printing was really the outcome of this Fraternity of the Heart. Five hundred years ago, or to be exact, in the year 1420, there lived in the city of Haarlem in Holland an old gentleman who was the sacristan of the cathedral. They called him the "Koster," and passed on to us the English surname Coster. In our day we used to call him the church clerk; in our modern days, when we have stripped poetry and romance from every office, we call him "the janitor." He kept the keys of the cathedral, opening the huge doors at sunrise and locking them at sunset. His real name, after the habit of those times, was Laurens Janszoon, Koster. Walking one day in the famous woods outside the city walls with his grandchildren and trying to amuse them, he picked up a very smooth piece of beech bark. It occurred to him that he might cut some letters of the alphabet on it. The children thought the letters wonderful. The carving was taken home and later it came into his head that by blacking the letters with ink he could make black stamps upon paper. After many experiments he succeeded in making whole broadsides of letters. From the wish to amuse these little Dutch children sprang the magic of the printed letter, the marvels of modern printing and the world fellowship of knowledge and beauty. The people of Holland claim that Gutenberg became an apprentice to Coster and having possessed himself of his master's secret went back to Germany and developed his discovery.

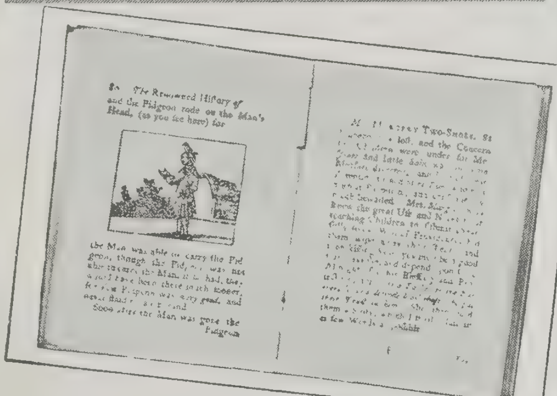
Now, as to the forms in which printing began to serve the children, here is the story:

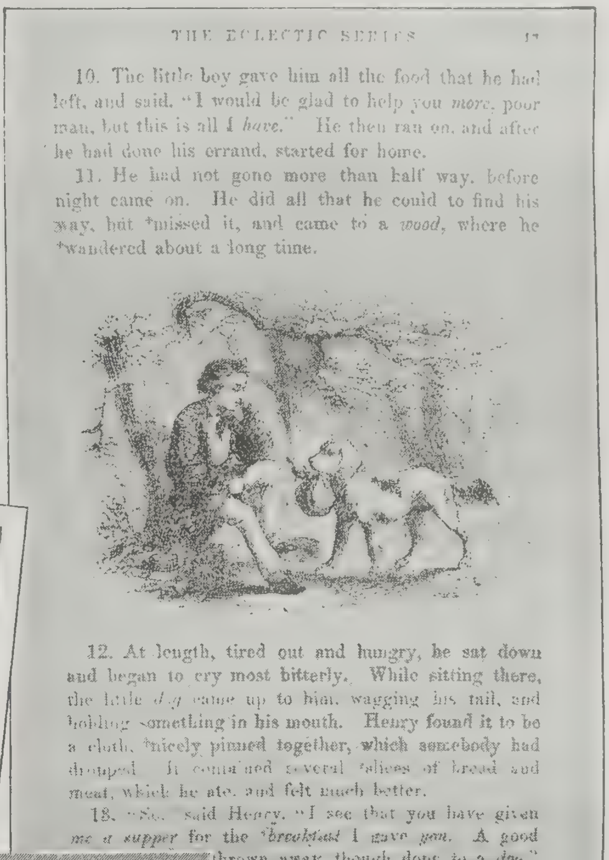
First of all came the Horn Books, also called the Battledore. They consisted of a leaf of paper mounted on a piece of wood, the lettering on the paper being protected by a thin sheet of transparent horn. As early as the year 1500 the Horn Book was used in teaching children. In an improved form it was to be found in remote rural districts of England as late as the middle of last century. Montrose I. Moses describes it very simply as follows: "Take an abacus frame and transfer the handle to one of its sides as a base. Within the frame insert a single leaf of thick cardboard, on one side of which place the alphabet, large and small, lettered heavily in black. Then, with the regularity of a regiment, string out three or four slender columns of monosyllables. Do we not here detect the faint glimmer of our college song, 'b-a, ba; b-e, be; b-i, bi: ba be bi'? It is essential that ample room be left for the inclusion of the Lord's Prayer. When this is done, slip over the face of the cardboard a clear piece of diaphanous horn, in default of which isinglass (mica) will suffice. Through the handle bore a hole, into which run a string. Finally, attach your handiwork to a girdle or belt, and behold, you are transformed into a school child of four hundred years ago."

In many of the Horn Books a Maltese or other form of cross preceded the A B C. The first line was called the "Criss-Cross Row," or "Christ Cross Row." We are told that at the beginning of each lesson the child would say: "God speed me, A B C."

The word "Battledore," from the similarity between the Horn Book and the toy, thus got an educational meaning, and for more than two hundred and fifty years it became the name of any instrument used in the teaching of children. Even when the first children's books appeared, having no resemblance to the shape of the Horn Book, nevertheless they carried the name of Battledore.







THE ECLECTIC SERIES

10. The little boy gave him all the food that he had left, and said, "I would be glad to help you *more*, poor man, but this is all I *have*." He then ran on, and after he had done his errand, started for home.

11. He had not gone more than half way, before night came on. He did all that he could to find his way, but *missed it, and came to a *wood*, where he *wandered about a long time.

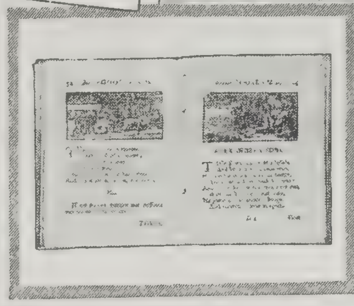
12. At length, tired out and hungry, he sat down and began to cry most bitterly. While sitting there, the little *dog* came up to him, wagging his tail, and holding something in his mouth. Henry found it to be a cloth, *nicely pinned together, which somebody had dropped. It contained several *slices of bread and meat, which he ate, and felt much better.

13. "So," said Henry, "I see that you have given *me a supper* for the *breakfast I gave you. A good

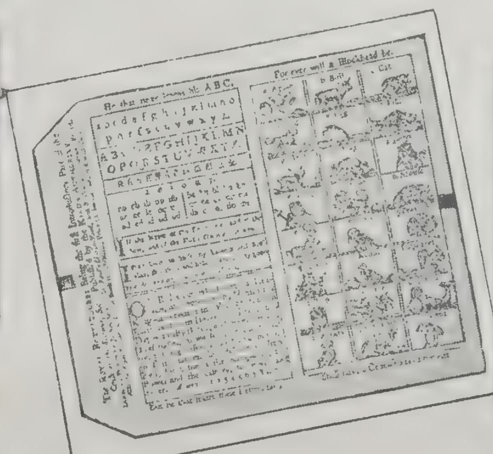
thrown away, though done to a *dog*."

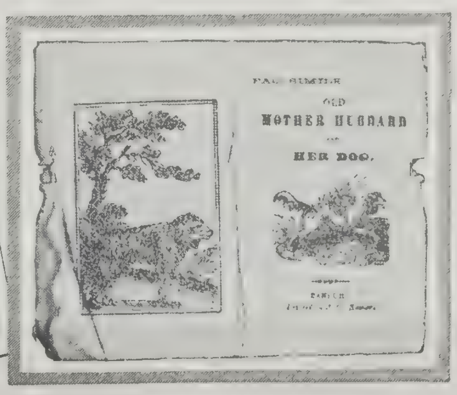
tried to find his way out of the wood,

ceed.



These illustrations are originals from early books for children. Left, above—A page from New England Primer. Below—From "Little Goody Two-Shoes." Right—From an early reader. Center—"Mother Goose's Melodies." Below, left—A Horn Book, or Battledore. Center—Another type of Battledore. Right—A Chap Book.





FAC SIMILE

OLD

MOTHER HUBBARD

AND

HER DOG.

Benjamin Collins, of Salisbury, England, and John Newbery, of London, printed the "Royal Battledore" in the year 1746. It was common enough as late as 1880.

Then came the period when books for children began to be considered from a new point of view. Hitherto discipline or religion had been the impulse; now, for the first time, the elements of interest and pleasure were recognized. It was the beginning of the "Chap Books," "Old Mother Hubbard and Her Dog," and the like. The "Mother Hubbard" shown here has fifteen inside pages with a lively woodcut illustrating the six or eight lines on each page. I came upon one of these in an old box in the attic when I was a little fellow and remember the delight I found in the pictures of the funny dog and his gentle mistress. The life, humor and aptness of the works of those early artists is too good to be lost. Somebody might provide a world of joy by a reproduction of them. The waters from an old well reopened can be as refreshing as from one newly dug. How many of them we owe to Bewick and how many to Oliver Goldsmith we shall never know. I own a copy of "Pilgrim's Progress" with an introduction by R. L. Stevenson, in which R. L. S. pays the highest tribute to the illustrations, while confessing their anonymity. If they are not reproductions of the work of Bewick, some unknown genius has lost the honor which belongs to him. Really there were two Bewicks, Thomas and John, the latter scarcely inferior; but to Thomas went the honor of being the first great wood engraver in England. An authority says: "Each of the cuts in Bewick's greater works is in itself a poem or story, abounding in incident, and full of pathos or humor, and excelling as a work of art in its extreme simplicity of execution. There is no line without a thought." How much he could put into a space less than an inch square! For more than a hundred years he was supreme. Like Dr. Johnson and Oliver Goldsmith, the artist Bewick was brought directly into the service of the children by that first great publisher of children's books—John Newbery, of St. Paul's Churchyard, London. Between 1744 and 1802 this man and his successors printed two hundred juvenile books.

I may here explain that the name Chap Book is believed to be an abbreviation of Chapman, an itinerant dealer or peddler. These men were the only agency by which these tiny but precious products of knowledge and art could find their way into remote cottages and farmhouses. These men and women traversed on foot the highways and byways of the country with a large basket on each arm, or a canvas sack on the back, and called from door to door. I vividly remember such a couple when I was a child—surely among the last of their race.

Isaiah Thomas, of Worcester, Massachusetts, was the first printer of books for children in America. Most of them were reprints of Newbery's publication, with adaptions. "The New England Primer," of which a page is here shown, was printed by E. Draper, for B. Larkin, in Cornhill, Boston. It is severely religious throughout. "The Shorter Catechism" of the Westminster Divines and John Cotton's "Spiritual Milk for Babes" occupy about half the book. On glancing through it one reflects that it was extraordinary milk! And the art, to say the least, is not Bewick's.

It was in protest against the severity of these books for children that the genius of William McGuffey prepared the famous "McGuffey Readers," which first appeared in 1836 and which have won such universal love in America that now the American McGuffey Society exists, with many famous names upon its roster. McGuffey humanized elementary education, reached deeply into common life and lifted out its lucid principles. Moralist he was, but his medium was the common, homely things of life.

The Advance of Labor in British Politics and Influence Upon the Lloyd George Fortunes

Fusion of Conservatives and Liberals, Seen as Result of Recent Triumph, Looked Upon as Most Effective Weapon Against Further Advance

By THOMAS CAMERON TAYLOR

ONE important feature of the interesting situation which has arisen in British politics, as a result of the recent general election, merits attention on the part of those who are following closely the developments in that particular field. It is a feature which, thus far, has received but scant attention, but of which more is likely to be heard when, the immediate necessities of the position met, the leaders have more opportunity to take stock. It is embodied in these questions—Has the British Labor party, in the success which it has achieved at the elections just concluded, actually furthered most definitely the formation of what may prove to be the greatest barrier to its further progress, a Center party?

Is not the Labor success likely to prove, after all, of greater moment to the aims of Lloyd George and their favorable development, than to the Labor party itself? Further, has the Labor party reached the limit of its advance in the favor of the British electorate? Behind that last question, be it noted, is ranged full knowledge of the history of labor as a political force in Britain.

At time of writing, there is dubiety as to how the unusual position of the parties will be handled in the carrying on of the functions of government, but report favors the view that the Conservatives will take up the task again with their depleted forces, and rely upon Liberal support to maintain them in office.

Labor Now Second Party

THE alternative to that is Labor government, and there is genuine anxiety among important men in the Labor ranks lest the party should be called upon to take office and should accept. Be the position what it may when these notes appear, it may be taken as certain that another general election will be found necessary ere long, and the considerations stated in the following view of a remarkable situation are set out with regard to that development in prospect.

In attaining so indisputably the position of second party in the House of Commons, on an electoral vote of striking magnitude, Labor has made a great advance. Has it not revealed, in notable degree, the effects of that process of unleashing which was the feature of the previous election?

That Labor advance should provide the chief feature of two successive general elections is on the face of it an impressive fact. The advance was due, however, and in consideration of the exceptionally favorable nature of the field, some observers are inclined to regard it with a measure of disappointment, and to attach to it importance chiefly as indicating and possibly influencing a greater development.

It should be recognized that beneath the seeming chaos of the British electoral outlook there is going on steadily a definite crystallization, upon which process the Labor advance may have a hastening effect. The struggle which for many years Labor as a political force maintained, against great odds, is well known. Its efforts to capture moderate opinion were hampered chiefly by elements within itself.

Conditions Favor Growth

LONG after he had ceased to be a sound Liberal, the Liberal with strong Labor leanings continued to follow the Liberal flag, for the reason that he could not trust the voices which seemed to sound most loudly from the Labor camp. Some of those voices were not too pleasing to Labor itself, for every malcontent of every shade of opinion, and every apostle of a new faith in things political, crowded under the Labor umbrella, and never in silence.

Then it was that the chief difficulty of the Labor party, in meeting the friendly moderate, lay in explaining just what it was. Interest in its work grew; discontent with the performances of the older parties increased, especially under the exceptional difficulties due to the effects of the war; and then the Labor party received and took advantage of a splendid opportunity of declaring what it was *not*.

The Bolsheviks provided the opportunity. British Labor formally and emphatically denounced Communism, with the result that at the election which followed upon the rupture of the Coalition, the pent-up force which had accumulated behind a barrier of electoral timidity and suspicion was unleashed, and Labor made its most astonishing stride onward.

The Liberal-Laborist ceased to be a hyphenate, and Liberalism was the loser. Labor has worked with great enthusiasm in the interval, and ever in a most favorable field, there being no improvement under the Conservative régime of the internal and external conditions which had defied the Coalition.

Centering its efforts upon the removal of the impression that it was incapable of reliable government, Labor has made headway. It has discouraged the "wild men"; it has sent forward to conferences of national moment men of good caliber who held their own with the best that politics and industry could select; it has devoted such attention to the young voter and the prospective voter as the older parties never dreamed of; and, above all, it has set itself to capture the comparatively new and incalculable element in British politics, the women's vote.

Unemployment, dear food, heavy taxation, woeful lack of housing for the people, and the utter failure of the older parties to bring about any alleviation of the real suffering of the working and middle classes: these are the conditions which have constituted a field so favorable to the advance of Labor, and in them lie some of the reasons for this further success.

Will Make Common Cause

IT IS a success which has brought Labor to an exalted but extremely perilous position, and it may be said that nothing in the circumstances would please the older parties better than to see Labor at this time take over the helm. Facing, with a force too weak to stand alone, and in its first essay at government, a task actually appalling in its domestic and foreign difficulties, Labor would be fair game for the older parties for whom the task had proved too much, and they could be relied upon to do their utmost to fix upon the Labor venture in the realm of responsibility a smashing discredit which would be disastrous to that party.

The effect upon the Conservative and Liberal parties of the latest advance by Labor is important, for, concurrently with that process of crystallization which has deposited so many Liberals in the Labor camp and so many Conservatives in the Liberal zone, there has been emerging a sentiment which, first expressed in Coalition for war purposes, has of late come to be regarded with a sense of inevitability.

The women's vote, the young voter, and denudation from Liberalism, have built up the Labor party. The Liberalism which remains is, in many respects, political, at one with the mass of what is now the Conservative party, but the Conservative party, in the mass, is no longer at one with the die-hard Tory element within it.

That element is coming to be regarded as having outlived its period. There is recognition of the essential oneness of the very powerful main bodies of the two older parties, and a close examination of the position is apt to induce a frank opinion that with the removal of a few dominant figures from their posts of dominance in both, there would be fusion.

This is a situation which is thoroughly satisfactory to the supporters of Lloyd George, and it must be admitted that there is much to be said for their claim that, given another election and another advance by Labor with "Levy on Capital" as a battlecry, the differences between the main bodies of the Conservative and Liberal parties will be composed in the necessity of making common cause against Labor, and there will emerge a Center party which will take the place of the two "worked-out" sections, in a country and a system which will not suit three parties of almost similar strength.

The Tory die-hards are not unaware of the position which is being forced gradually upon the Conservative party by the Labor "menace," and in those quarters of the Liberal party where there is no love for Lloyd George there is a measure of rueful recognition that "something in the nature of fusion seems the only way to beat the Socialists now," and that in any fusion that may take place, David Lloyd George will not be far from the head of the new force.

A Center Party—But Not in Name

IT IS pointed out that if the Conservatives are permitted to continue in office after the upheaval at the polls, it will only be because *there is in actual operation, for Parliamentary purposes involving opposition to the Labor party, a mass of united Conservative and Liberal opinion which is in everything but acknowledgment and name a Center party.*

Report has it that Mr. Lloyd George has emphatically denied that there will be any coalition between the Liberals and Conservatives and Mr. Asquith with no less emphasis has intimated that there will be no combination of Liberal and Labor. The denials were unnecessary. By the time the lessons of the two latest elections in Britain have had time to make their due appeal to the cool judgment of the parties, the Center party idea is likely to have made great progress, for the reason that the outstanding lesson of the situation is that neither Conservative nor Liberal party as such can stand alone against Labor.

The most interesting speculation at the moment is whether it will really require another election, and another advance by Labor, to scare the main bodies of the Conservative and Liberal parties out of the old trenches and into the open as a united Center body.

The existence of a very considerable "free" vote in the British electorate—a volume of voting strength unattached, and susceptible to the influence of the program most attractive at an election period—must be taken account of.

The extent to which the free vote was bestowed upon Labor on this occasion cannot be accurately determined, but that it was represented in the Labor poll is not to be doubted, so deep and widespread has been the irritation caused by the failure of the older parties to bring about improvement in the circumstances of the great mass of the electorate. Upon that free vote, Labor cannot depend any more than can any other party.

Further, in any consideration of the question as to whether Labor has reached the limits of advance, careful observers are setting aside part of its recent growth as being forced growth, not to be relied upon as lasting when the conditions which encouraged it have been changed.

If in Control Would Make Good

THE friends of Labor in Britain are convinced that the party would make good, and assure its sound progress, if it had an opportunity to show its worth in office; but they are not anxious to see it take up a burden which has already brought low its powerful opponents despite their experience and resources, and which is probably the greatest which has faced any government in Britain for generations.

For that change of conditions, however, which may deprive Labor of some of its present strength, one must look out with Britain. Until there has been achieved the rehabilitation of her customers on the Continent, until the position of Germany and the reopening of Russia on an appreciable scale have been brought about, unemployment in Britain is not likely to be reduced sufficiently to render the electoral field less favorable to Labor.

It may be considered most probable that, should the protagonists of the Center party find another Labor advance necessary to force the fusion they desire, the next election will be precipitated when conditions abroad appear to be approaching a favorable turn, but when affairs in Britain are still in a state favorable to a further Labor advance.

The strings are in the hands of Lloyd George and his friends, in so far as they know that at a pinch the forces of Labor will be met by a Parliamentary combination strong enough to beat them. The more extravagant the Labor electioneering slogan, the better pleased will the Center party men be. The die-hards must be thoroughly scared into taking refuge in a Center party, they argue, and only a Labor advance will do it; and the more terrifying that advance the better.

"Levy on Capital" Suits

THE Labor slogan, "A Levy on Capital," suited them admirably. They are not afraid of it, they say; less afraid than the Labor leaders would be if they had to apply it; it is serving the Center party even better than it has served Labor. An election brought about under the conditions above indicated would be most likely to show a further Labor advance, and assure the hold-up of Labor for years by the formation of the Center party. The mass of the British people at this juncture is not inclined to look at broad national or international necessities. They see at the moment their own misery.

Given any alleviation of those conditions, however, there would be found in Britain—and the Labor party would be the first to make the discovery—a widespread realization that a country which depends on outside suppliers for its food and outside buyers for its goods cannot live "by taking in its own washing," and cannot afford to confine itself to domestic politics.

Meantime, exultant and enthusiastic, Labor continues its efforts, and the Center party hopes to reap substantial benefit therefrom. It is interesting to recall that the position which has now arisen in British politics was accurately forecast by a British industrial magnate, a Conservative fusionist, nearly a year ago. He had taken his impressions from close contact with leaders in the parties which are called Conservative and Liberal meantime.

Bingham, a City Seen Through a Copper Haze

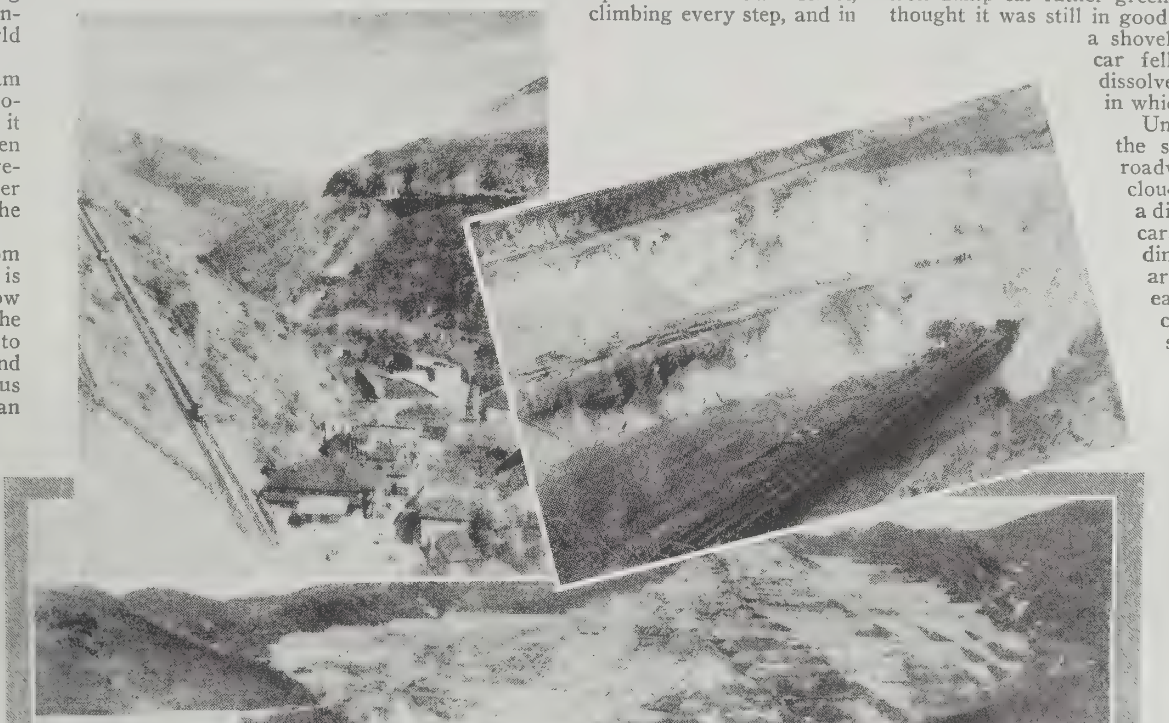
Utah Town Strings Along for Ten Miles at Foot of Great Mineral Mountain

By WYMAN SMITH

BINGHAM, ten miles long and a hundred feet wide, clusters its smoky houses in the canyon which runs at the foot of the mountain of copper. Bingham first began when men washed free gold from the gravel of the little creek which now runs underneath the sidewalks and houses of its single street; and it continued when those men who in daytime tunneled, bored and explored the surrounding mountains returned at night to their little shacks and huts in the gorge bottom. It boomed when several mines began taking out lead, silver and zinc containing ores, and then it boomed again when steam shovels began to scoop up a mountain of low-grade copper ore to be shipped down the valley to the concentrators.

Thus it is today a town of copper where ten thousand people live, where the pale cuprous sunlight seeps slowly through the mist and smoke of days, where the glowing copper haze floats down the narrow main street to overflow into back alleys and balconies, where copper-colored houses cling to the canyon walls, and where a sallow cuprous moon peers into the town at night to bask a thousand windows which glow like cooling copper. When I first came to Bingham I craned my neck and gasped and wondered how or why anybody could live there, but when I had stayed there a time I found it curiously, ingeniously, uniquely fascinating, and I listened to the whistles, heard the thunder of the big blasts, and watched the dinky engines crawling around the mountain sides until I wondered if in all the world there was another such place.

So many things in Bingham are copper-colored, so many people work with the copper, that it is impossible to walk a dozen steps without seeing some reminder of that vast copper mountain which dominates the mining camp town.



Above, left—The side hill tram which carries workmen and others up and down the hill free. A few more houses at the lower right. Right—Run-off water from the copper mountain is caught in this pit and run over scrap iron to remove its copper—this is one collection of the wooden seepage vats. Center—Bingham and the biggest open copper mine in the world. The cluster of houses in the canyon bottom is part of the single street which is Bingham; in the little square at the left canyon wall are eighty-ton gondolas loaded with rock; the pyramid-like affair in the background is the mountain of copper with railroad levels.

We had taken a stage from Salt Lake City, for Bingham is located in one of those narrow canyons which lead down to the Salt Lake Valley or lead up into the wilderness of mountains and plateaus. It had brought us along the road and finally began the gradual ascent which leads to the canyon. On our left as we rode appeared bridge structures and spans of the "high line," a railroad built to the top of the mountain at enormous expense but which has since fallen somewhat into disuse; below us was the great white, arid waste of the old concentrator dump where a few skeletons of trees are the only life to appear in several hundred acres of the finely granulated rock. Then came a few houses and finally we felt the humming of the motor as it was thrown into lower gear—we were climbing upward at an angle of what seemed more than twenty degrees and we were in a street so narrow that two automobiles could just pass—not more than twenty feet wide. And there with the front porches a few feet from the sidewalk and their rear steps backed into the cut-away mountain side were the houses. Some of them were newly painted, but some were dulled and weathered from several seasons of smoke; some set back high on the slopes like perches and were reached by long flights of steps; most of them had their fuel boxes out in front next to the street and I saw boys or women coming out with coal scuttles to carry in a load of fuel.

We passed the schoolhouse, which is set right on the street and has only a small area for playground—but then, children in Bingham don't need so much exercise in school; they have it climbing up and down hills or playing basketball in some back corner or clambering up and down the mountain side. For it is utterly impossible to walk anywhere on any street in Bingham without going up or down hill. Yet those youngsters go uphill at a run and mind it not at all, while we went puffing along and stopped to rest every little while. The altitude causes that, too, for the town is almost seven thousand feet above sea level; the lungs never have time to grow lazy.

"But I wouldn't live here for anything—not if they gave me the place," an elderly retired farmer from the Middle West reiterated. And he may be right, but anyway, it's interesting to see how things are done here.

The stage stopped and we stepped out, took rooms in a near-by hotel and discovered to our amazement that we had hot and cold running water and electric lights in a moderately priced room. Things aren't so bad after all. And when I looked out of the window I saw a great steel viaduct bridging one fork of the canyon—that is part of a new railroad which is the most expensively built road in the world. Less than a mile on one spot cost more than a half-million dollars to build, and copper did that. I saw, too, where that railroad came into the town and the little trolley or cable car which runs up and down hill with passengers; one car goes up and the other comes down on the forty-five degree slope. The cable car hummed on its track and then on the viaduct came the clatter of a train and a little dinky engine hauled over five or six gondolas of ore to help make the long train which mogul locomotives haul downhill to the concentrators in the valley beyond.

What a place—I was anxious to be out and moving about and accordingly I set off up the street toward a little town cluster called Copperfield.

I heard water running somewhere, gurgling as though it were underground, and I looked about in amazement. Then I walked up the narrow street, climbing every step, and in two blocks I met Chinese, Japanese, Italians, Greeks, Austrians, Serbians, Scandinavians and others of nationalities I didn't recognize. But the Old World customs still lingered; I could see not only from the men themselves but also from the store windows and shops. At one side of the street was a chop suey and noodles restaurant, which I planned to visit later, and the store windows displayed gayly colored flannel shirts and neckties. I saw these bright colors worn by the dark-eyed, dark-skinned men who carried lunch kits; for that is the way these strange, happy people live—they like colors, green, blue, purple, maroon, for their shirts and ties, and though they go to work, they make work something of an adventure, a little daily escapade to be enjoyed. And they chatter and gesticulate as they walk two by two up the hill to work or down to their homes below.

Around a corner I solved the mystery of the running water; a fire had burned down several structures and through the debris ran a tiny stream which came from beneath the basement of one store and disappeared under the wall of another. It is the stream which flows under the sidewalks along main street.

But right alongside was another queer thing; wooden tanks were filled with rusty old tin cans over which a small stream of water was brought from some place above. I asked what that might be for and a man told me; the water which drains from the surrounding mountains contains copper in solution and when this water is allowed to trickle down and around old scrap iron or rusty tin cans it combines chemically with the metal, disintegrates it and finally becomes only a pulpy mass of copper and iron and tin which is shovelled up and taken to the smelter. Not a lot of copper, but some; about twenty pounds per thousand pounds of water, which is enough to turn in a good many thousand dollars every year when we consider the amount of water which flows day in and day out, month after month. A miner stopped to tell me of an experience he had with this copper and iron combination; he had been working with a crew which pumped out an old mine level and when they finally went down they came upon an old iron dump car rather greenish and pasty looking. They thought it was still in good condition, but a blow from a shovel produced no ring and the car fell into pieces; it had been dissolved by the acid-copper water in which it had set for years.

Under an old wooden viaduct the sunlight sawed lines in the roadway, a shadow from a smoke cloud passed, and up above I saw a dinky engine and its half-dozen cars scooting along. Those dinky engines are funny; they are short as though cut off at each end and they have no coal car so that they can make the short curves which take the track around the mountains. I saw this one go and learned that it was only carrying rock around the hill to be dumped on the waste pile; all the ore goes over the viaduct I saw from my window.

A little shack stood up on the slope near the tracks and I climbed to it to see what a man up there meant by waving a white flag very briskly now and then. It was a good climb of about three hundred feet up the slope, but the man saw me coming and when I stopped to rest waved me on. I arrived and he greeted me cheerily, for his name was Nick. Nick and I talked of many things then, for he was a flagman and all he had to do was signal the engineers for a clear track ahead and pass the signal on to two other flagmen, one on each side of him. The shack where he stayed during dull hours or on winter days was built of railroad ties like a log house, and a few pieces of tin on the roof were weighed down with gravel to prevent their blowing away. He had a stove inside and all his kindling was cut up in ten-inch lengths and split to about an inch square—that means economy in wood burning. He had a chair, a bench and a table inside, but only one tiny window; and he had papered the walls with pages from some old mail order catalog.

A section of the ten-mile Main street.

I had been so interested all this time in Nick that I hadn't noticed what was back of me. But I turned and before my eyes was the mountain of copper with its steam shovels, twenty-one railroad levels running around it, its smoke and its gray and green and rusty colored rocks. A mountain of copper.

It was a sight which had stopped thousands and it encouraged T. A. Rickard in his "The Utah Copper Enterprise" to exclaim: "This great quarry has a face which is 1,500 feet in vertical height and 3,600 feet wide at the base. To realize the bigness of the mine, it is best to ascend halfway up the opposite hill slope

Man Games and Man Friends of Twenty Years

Five Friends—Their Lives—and Their Play—by One of the Five

By WILL LEVINGTON COMFORT

THE majority of men pulp down into senility in a way acceptable to society and themselves, but now and then a man of forty is suddenly confronted with the fact that his body isn't what it was, and he sets out to do something about it.

I knew four men twenty years ago in Detroit; in fact, I was a sort of fifth. There was Eddie, who ran a daily column, largely verse, on a morning newspaper; and there were Walter and Gnat and Art, all newspapermen, except that Art wasn't a reporter, but worked in the art department. We were all in early twenties. The four were making good, emphatically, but were reaching that period of strain which faces all young newspapermen, who love the game, but increasingly dislike the idea of staying poor. Nothing like newspaper work for awhile. I think I never learned life faster than during my first three months as a cub reporter.

Twenty minutes for lunch and an hour or more for billiards—such was the order in those days. The talk that passed around the tables was always a deep joy. I could never hope to keep up. Alone, afterward, perfect answers and true turns of humor would come to me, but such wouldn't even do for next time. Sometimes we sagged down into kelly-pool, and I always noticed that the talk got a bit looser to go with it, the voices louder.

Use Your Pores, He Urges

BILLIARDS is a real game—a quiet, integrated thing. It has its own moods and cares; it challenges because of its niceties and its almost infinite possibilities. None of us were natural billiardists, but we played regularly enough and persistently enough to get in toward the core. Occasionally we would see men at the other tables, those who really gave themselves to their play, and watched how they came on and on.

The other four frequently were together evenings, but I didn't regularly get into this part of the association, though I joined them for a poker night from time to time. Gnat developed a slight aptness for this game. Poker is a rough-neck thing like kelly-pool. The mood that goes with it isn't clean-cut. I know there are many people who differ; I'm only putting down my brush with it. I never went into it deep enough to arouse the analytical (certainly not the psycho-analytical) faculty and so missed a certain studious fascination of faces and atmospheres. To me poker meant too much Dutch lunch, far too much smoke; one felt frowsy and dilapidated next day, and had to scrimp in expense money for days to come . . . . Not one of the four seriously drank or gambled. In all the years with these fellows, I never saw an irritation carried so far that it didn't lose itself in laughter.

Occasionally, about this time, Walter used to talk about tennis while we were at billiards together. Walter differed from us in two distinct ways. First, his family had some money, and second, he was college-bred. It appears he had learned some tennis at college and had made a court on his property. He used to appear a bit burned and lamed on Mondays, after a Saturday afternoon and Sunday on the court, and we would remark to each other at billiards that it was a sure sign of deterioration—this absorption of Walter's in the net-game.

Tennis and I had never come together in the boyhood time. In fact, I took on the prevailing nonsense that it was a sort of sissy game and gave my time to baseball, in which nine men learn to pull together as in no other set of conditions. Some of the intensest moments I have lived, have been behind the bat as a youth; also some memorable ones as a spectator.

Study of the great gamesters and athletes of baseball and other sports has had a continuous attraction for me; but something of this is so with most men. The extra ounce of science, endurance, or punch that makes the champion, calls thousands to the arena, where tens go out to see the "comers" or the "near-greats." I believe we are all looking for a "miracle" to be pulled—some dazzling, unprecedented but supreme action to be uncovered before our eyes. Unquestionably it is a certain super-touch which makes the champion; and a hint of the mystery may lie in this point, that there is always ease and grace connected with it. The sensational player "uncorks" his bit of mastery, but does his thinking afterward; in fact, he is apt to be as astonished as the spectators. This spontaneous power appears to be something of the same thing that occasionally takes a man, droning through an after-dinner speech in public, and suddenly lights him up, so that even his wife doesn't know him for a minute.

Eddie used to go out to the league games nearly every afternoon during the season, when the team was at home. I had years of this, off and on, too, and for a while wrote baseball for an afternoon paper, but this feature wasn't a success. A real baseball writer, named George Morrison, had been on the paper just before I took the column. I couldn't make the readers forget old G. M. They used to write letters in to the sporting department asking when George was coming back. The editor would have these letters spread out for me to see, and cool his eye on my neck and shoulders, as I perused.

In the twenties, most men, even in these days, give up actual participation in games of exertion, and take it out in occasionally watching others play. It was so with us, except in Walter's case. College had taught him to play along as he worked, and this is one of the best things about university training, as it looks to me. We were lost for a time to the little games, having entered in the greatest game of all; absorbed in life, its gruelling technic, its almost endless possibilities for showing up the youth, for defeating his most courageous attempts and checkmating his most "consummate" moves.

But there is no time in life when boy or man can afford entirely to put aside outdoor play. It is true that a man must learn life, learn his especial place, learn *to* work; but he can go only just so far without becoming stodgy or stale, if he neglects the games essential to physical well-being. The pitiful part is he never knows what he misses, or what he might have done, if he fails to "get outdoors" until too late. Billiards, chess, and all the indoor or winter games relax and strengthen the mind. They push out the ever-encroaching death from a man's brain, in proportion to his interest in them and in the associations connected; but no man who means to keep pace with the youth of this rousing hour can afford long to be without participation in some outdoor sport. The woodpile or walking to the office won't do. Play itself is as much in the harmonic scheme as work.

Most of us eat all over the mark. In the forties, all this food begins to pile up and backfire. How many Americans at their high point of usefulness get a good sweat every day, or three times the week? How many even stop to think what a good sweat means? They know the cold sweat, the night sweat, the nervous sweat, but the fine effect of a physical workout isn't in their common experience. Yet we have millions of pores; in fact, these form one of the means which the organic body has of throwing off its waste. They should heartily be used every day. Another eliminative process is breathing. Most men breathe a little in the roots of the neck and let it go at that. So it's up to the liver and kidneys to take care of the accumulations of some forty thousand meals, which a man has put under his belt by the time he is forty. It can't be done. The citizen fills with cysts.

Eddie Liked League Ball

EDDIE would say that to lose himself in a league game in the afternoon made him over. It was so. He unwound his very fine little rhythmic wheel all morning, whether he felt like it or not. Making lyrics is a delightful indoor exercise, when you feel like it, but a daily column isn't to be put aside for whims. Some days a column is a mile long and you have to do it on your hands and knees, and queerly enough a lot of people will tell you that they liked it that day, even if you didn't. Eddie found he could uncoil the tension of the long forenoon, out in the ball park later. But that didn't continue to work. He needed to play himself.

We tried to get a few fellows together to "knock up flies," but in baseball you are dependent upon others and roomy lots. There aren't the facilities for it nowadays in city life. It was Eddie, first of all, who gave us something really to talk about around the billiard table. He wasn't at his desk afternoons, neither was he in the grand stand at the ball park. A friend of Walter's located him finally in a suburb green. He had taken up what was popularly supposed in those days to be the sport of the elder rich. Eddie would color under his delicate tan, as we discussed his abnormality, and for a while didn't even answer back.

Walter was first to leave newspaper work. We all felt a bit dubious about it, but he had something, as has been said before, something we hadn't—money and "education." He started a trade paper and slowly but solidly set about making good. A little later, we had a bit of news, indeed, over the green baize: Walter had taken Gnat into the business. Eddie's newspaper began to syndicate his verses in a small way, and his income sharpened a bit. I lodged a book in the market, and fell for the pastime of memorizing some literary reviews and forgetting some others.

Still we had billiards—two or three of us now—rarely the whole five back for an hour. I was as irregular as any. Art and I occasionally walked together in the later afternoons. We disposed of many glaring faults of society. I found that between us the character of Gnat was one of the pleasantest subjects. "That little guy—" Art would begin. Incidentally we deplored the conduct of Eddie for becoming an after-dinner speaker, and for reading his verses aloud. But a cityful loved Eddie by this time, and we were only peeved because we had known what he was like all the time, and our deeper intimacy was being rocked by a public's glamorous attention. Art himself was in the world-old struggle of making a living on one hand and painting what ought to be painted on the other. He never married and so kept a delicious sort of novelty about the feminine in his own fancy.

And so, until our late thirties . . . I was the first to leave Detroit permanently, deciding to live in California. About the same time I stepped on a cement tennis court for the first time. Before a half hour was over, the cement seemed cruelly hard and hot. That was a sad day all through, but important. I discovered in what questionable shape I was physically. The game showed me up in other ways. I was practically powerless to do what I wanted with the racket and ball. The sort of fatigue I knew after an hour or so wasn't pleasant. There was sickness in it and organic revolt. I recalled that on my way to the court I had fancied I was in pretty good shape.

Tennis Comfort's Choice

ANYTHING that can show you up like that, is worth staying with. I found a similar experience in checkers. One of the boys with whom I played tennis observed one day that checkers had something to it. I found he was right. I didn't mind being beaten every evening for weeks, but I did mind the atrocious lapses of my attention, the inability to see but one side at a time, the humiliating repetition of mistakes—all in the mind-realm. I wasn't interested in becoming a checker-player, but I had to do something to repair these sickening failures; in a word, I was challenged to accomplish a certain mental integrity which checkers showed I lacked. Chess, of course, is pre-eminent in helping one also to a mental poise and grip, valuable in one's daily working equipment up and down town.

Tennis had the thing I wanted, the thing I needed. I haven't a word to say about golf, as a game. I know that it has proved the way out for many men, as tennis has proved for me; that taking it up has meant an entire reordering, remodeling of physical, if not moral, health. Personally I haven't got to golf yet; all I know is that I like the whang of certain of the clubs . . . .

Tennis has the cleanest "feel" of any of the outdoor games I've played. The decisions of one's play are largely left to the opponent, and almost invariably one gives and receives the benefit of the doubt. In fact, the player who favors himself in a close decision is outside the ethics of the game, and whatever progress he makes will be uphill work.

Of course, one has to learn technic in any game. A great pianist naïvely informed his pupils that all their time was wasted in learning technic; that the real workman or player forgot it entirely, before he became significant. All of which is superbly true, but the pianist, for the moment, had forgotten that he had spent twenty years in slow, sordid, technical struggle, before he dared to throw away his crutches. It is so in tennis or any important work or play. One wears through, grinds through, the early stages, by dint of mere hand and brain—and then, to one in a thousand, a sort of lightning strikes, and for moments at a time, at least, he *produces* in an altogether new dimension of performance. There is always time to spare in this higher dimension of play. By some secret, the player starts to act earlier. It is not headiness or strength or speed. It is inspiration—the same thing that strikes a poet or an inventor. The thing as stated at first works easily if it works at all.

I have stayed with tennis for five years—three or four times a week, a year-round season in Southern California. A man must become patient, if he undertakes to make over his body. One after another, mysterious physical frailties show up for repair. One who doesn't test himself cannot possibly know the process of deterioration going on within.

For certain hours every day for twenty years I had hunched over a typewriter, which usually rested upon my knees. This method of writing supplied a superlative arch of neck and shoulders. Once at tennis, along about noon, I saw my shadow on the concrete of the court. It made me think of a hooded cobra as it lifts to look you

(Concluded on page 15)

Mr. Ford's Page

THERE is no reason for legitimate business having anything but a successful year in 1924. All the elements that make for industrial prosperity are present in sufficient strength to justify everyone looking forward with confidence. Unless some wholly unforeseen folly makes us its victims, there is no reason why men should not launch into the new year with all their energies, fairly confident that their labor will not be in vain.

This is said in full knowledge of the fact that 1924 is an election year with all the possible disturbances attendant upon political conventions, presidential nominations and a national election. The ability of politics to interfere with the proper life of the country is known to all. Election periods are sometimes used as tyrant kings once used war—to divert the minds of the people from their proper problems and duties. And, of course, if politics, our greatest indoor and outdoor game, is allowed to usurp the field this year, then the results may not be good.

THE New Year opens with promise of continued prosperity. The only chance of disturbed conditions which can be observed now is the possible effects of an election year. In the past, politics has interfered with the proper life of the nation. There is something bigger in the country than choosing sets of public servants. When we have a good administrator of national affairs who is sincerely and consistently filling his job, there is no need to consider a change. Especially when there is no serious difference in the policies proposed. The United States has confidence in the President and the excitement usually attendant on an election need not occur this year. We need all our national energies to continue the country's march back to sound conditions.

But why should not 1924 be an exception in this respect? It is not suggested that the people remain indifferent to the choice of a Chief Executive and other officers of the government; it is only suggested that they go about it in a businesslike way. Of late years, since spectacular political methods have fallen into disuse and since stirring issues have ceased to arise, there has been a tendency on the part of the people to let elections go by default. Indeed, large as has been the total vote, and large the majorities, the figures show that about fifty per cent of the voting population thought it useless to go to the polls. Maybe it was, since the voting choice usually given us is between two men carefully chosen by the real rulers of the people in secret session.

Elections differ one from another in that some are decided upon serious proposals to change national policies, while others are restricted to the mere choice of administrators of the national business. There have not been serious differences of policy proposed of recent years so far as our internal national affairs are concerned; both the parties have come nearer and nearer the same point of view on national policies, so that modern elections consist mostly in making choice of those to whom we shall entrust the conduct of government. It is practically a choice of men.

Candidacies in such periods resolve themselves into aspirations for political honors, a contest of men for high seats. Certainly this is not sufficient to justify the whole nation neglecting its business. Even a Presidential election degenerates into a national popularity contest under such circumstances.

This year, however, we have a President. He was placed in his seat through the sad event of the former President's death. His accession gave a distinct sense of hopefulness and expectancy to the people. His conduct has been becoming to his high office. The tone of his mind has been conservative and independent. His utterances have been marked by good Yankee common sense that has made the people feel confidence in him. There is a general agreement that he wishes to do the right thing, that he will not be easily fooled by the self-seekers which always throng a President, and that his desire to do the right will insure his discovering a way to do it. Although he has been in office but a few months, already the distant rumblings of a campaign are reaching his ears, and it is a distraction, a distraction to which he ought not to be subjected.

We can help business, help the President, help ourselves by looking at the situation calmly now before the discordant cries of rival parties and candidates are heard, and making up our minds what ought to be done under the circumstances. It is just as easy to forestall all campaign disturbance now as at any other time. It may be done simply by agreeing that the Administration of our government as now in progress is as good as any administration we should be likely to gain through a change—probably better than we should gain through any change now possible—and by agreeing further to settle our preference now, registering it quietly when election day comes.

If we will do this it will have a tremendously stabilizing influence on prosperity during the year 1924. It will completely forestall the political silly season. There are men, of course, who will object to this point of view, because their *business* is politics. It is hard for plain people to realize, but it is a fact, that there are men whose whole business in life is measured by political, partisan and election activity and whose life would be completely disordered if they were to miss an election. These are the men who find it profitable to stage the national pageant which we call an election; they study for it and work for it and plan for it years in advance; their success depends on attracting the nation from its work, creating national excitement, putting business in a position of uncertainty, and broadcasting the impression that, as the election goes or fails to go, the general fortune of the country will rise or fall.

Now there is no need for this. Opposing candidates there probably must be in every election, and always there will be a sufficient number of men desirous of political honor to fill the places on the tickets; but the fallacy that the country goes up with one administrator or down with another is one that should be discarded this year.

It is unfair to the President's chance of usefulness to the country to thrust him into the circumstances of a campaign before he has had time fully to accustom himself to his duties. It is one of the faults of our present system that directly a President takes office his first concern is almost necessarily to safeguard his political position. It has been said that three years out of the first four years of a Presidential term has been spent in preparation for the next election. If this is true, it is a serious loss to the country and a serious injustice to our Presidents. They have the right to be left free to perform their duties as best they can, without being dragged into political controversies and campaign contests from the very day of their inauguration.

It seems as certain as such affairs can be that the President will be nominated and elected. He is not without enemies by any means, but a man may be judged by his enemies, and it will become more and more apparent as time goes on that the President's enemies will mostly comprise the men who have tried to use him and have been rebuffed. The country is very sensitive to the type of men permitted to surround a President, and thus far the wrong type has not been apparent in the President's immediate circle. This has gone far to give the people confidence in him.

The question is not whether all of us agree with everything that the President believes and suggests. His beliefs and suggestions are not law and are subject to the same revisions and corrections that the beliefs and suggestions of the rest of us are. The question is this: Is the present President a capable, honest, efficient, sincere, righteous administrator of the chief executive office of this government? If he is, and the agreement that he is appears to be general, why interfere with our march back to prosperity by stopping to play at politics and making an unnecessary change?

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

And There Is No Peace

IN THE United States during the past year, thousands of persons wrote their ideas on how world peace could be attained. Some wrote in the hope that they could share in the Bok peace prize. Others wrote for the sheer love of peace. In China, a magazine is conducting a similar contest, designed to obtain ideas which will lead to peace in that ancient and troubled land. In Europe and the rest of the world, great thinkers have given their time and thought to the mighty problem of ending war.

And the net result is that the Nobel Committee decided not to award the annual peace prize for 1923.

The world cries for peace and dreams of peace. But there is no peace.

A glance over the world discloses few wars of any consequence. True, in Mexico, Mexicans have been fighting Mexicans. Afghans have been menacing the passes as usual. The Spanish Ministry has been in some doubt whether ransoms or arms must settle its African problem. In the Ruhr, armed invaders bear rule. And in Russia, the military establishment holds the government in power. But of real orderly war, with lines of battle, trenches, bombing planes, poison gas and swivel chair heroes, the year 1923 was singularly free. Still the Nobel Committee, in all the world, was unable to find one man or woman whose efforts on behalf of peace deserved its award.

There will be none to criticize the committee's action or rather refusal to act. It was practically a rebuke to the world for its failure to advance the cause of peace. There are no wars in the world, but the world is in a decidedly less favorable position in connection with peace than it was a year ago. The peoples of all lands want peace, but the statesmen who have risen to power in recent months are not notably pacific characters. M. Poincare's administration has been one of might. Russia maintains its arrogant government. Mussolini, in Italy, is far from being an apostle of peace. General Primo de Rivera, in Spain, stands for the rule of blood and iron. The year just closed was one in which many of the nations were simply great armed camps. Many, too, complained of their dire financial and industrial straits. It is to be hoped that the Nobel Committee will be able to award a prize at the close of this year. Perhaps someone, who can teach the nations to work rather than to arm and drill, will be entitled to the prize.

Misinformation on Money

IN A recent issue the *Republican* devoted more than half its editorial page to an article on "Misinformation About Our Monetary System." The text is the alleged claim by an unnamed western paper that there are twenty-one different kinds of money in use in the United States. The *Republican* denies this and enumerates the nine kinds issued by the Treasury Department and apparently forgetting the various forms of personal and bank credit through which nine-tenths of barter and exchange is transacted. This volume of extra-official exchange media is to all effects and purposes "money," and may support the western paper's contention, while the *Republican* may with as good grace claim that technically there is no money but that emanating from the Treasury.

But the *Republican* is in error here, for certain forms of bank credits, forced into use during the "Bankers' Panic" of 1907, in violation of the National Bank Act, were validated by Congress, and are today a part of the monetary system authorized by law. During that panic, there were times on the border when Canadian currency was the only medium of exchange it was possible to get, and it served just as well in the emergency as United States money could have done.

In its next contention the *Republican* falls over its own feet. Having distinguished nine varieties of money issued by the Government, it denies the power of Government to issue money at all, declaring that the Constitution only gives Congress power to coin money, regulate its value, and to borrow.

It is constantly asserted that all that is said of money is comprised in these sections of the Constitution. This is scarcely the fact. Power is given to emit bills of credit—issue money—specifically, while the prohibition to the states of that right and the right to coin money or to declare anything but gold and silver a legal tender, carries inferentially the duty as well as the right of the Federal Government to provide a medium of exchange. Such an interpretation of governmental functions has been fully determined by the courts.

The next statement is that banks of issue are created by the Government for the reason that it would be unsafe to permit a government issue of notes. If the Government has no power of issue, where is its authority to create banks of issue? The fact is, the banks of issue were created by the government giving over its power of issue to a privileged class of money brokers, who have never since relinquished their power to tax the people.

The *Republican* then goes on to commit the folly of declaring that no man or group of men has power to control the volume of currency. It is hardly worth while to refute the assertion, but if the broadest system of governmental banks of issue ever instituted could not control volume why has it been that for sixty years the authorized volume of National Bank notes was not issued, and how is it that under the present system there is a constant variation of volume in circulation?

The *Republican* holds that it is not true that debts ever have doubled or increased, and denies the existence of debtor and creditor classes. It denies fluctuations in price levels because of fluctuating money values, except in the Civil and World War periods. It predicts a seasonable return to normal level from the present.

Is it possible the *Republican* does not recognize the disaster any approach to pre-war levels in prices would bring? That would mean the doubling of the present purchasing power of the dollar. Every public and private debt is contracted on the present level. Debts are not canceled by money but by production. Double the amount of production needed to cancel a debt expressed in dollars and the debt is doubled. There can be no disputing it. The wage earner knows if it takes two days' work to earn the payment on his home where one day would have produced the same result when the contract was made, he has had his debt increased. Not only that—he has lost half the dollars already invested.

The *Republican's* caption is correct. It heads a vast amount of "Misinformation About Our Monetary System."

Owsley's Good Sense

ALVIN OWSLEY, past national commander of the American Legion, has refused to run for governor of Texas. He is a Democrat and his chances of nomination, which is equivalent to election, were considered good.

But Mr. Owsley declared that if he was elected he could only expect to leave office, broken spiritually, mentally and financially.

Such good sense is rarely displayed by those who are taken up to the heights and shown the comparative ease with which political office in a republic may be obtained by them. The ambition for political honors is natural and those who can resist the temptation to seek them are not numerous.

Mr. Owsley refuses to capitalize politically his war service. His forbearance is praiseworthy.

In a nation possessing more than 4,000,000 war veterans, it is obvious that government offices in great number will eventually be held by former soldiers. But the fact that a man has served well in the military or naval forces in war-time is not in itself proof of his qualification for civilian office. To some extent, the fact that a candidate for office has once served in the army may affect his vote. But it should, by no means, be the determining factor.

Mr. Owsley sets a good example to his comrades in refraining from seeking office on the basis of his war record.

Worthy Legislation

THE filibuster over the ship subsidy last year resulted in the sidetracking of the legislation designed to revise and simplify the American consular service. The measure, introduced by Congressman Rogers, of Massachusetts, had the indorsement of Secretary Hughes and had been passed by the Lower House.

American foreign trade deserves a consular service of high grade. The American diplomatic service needs trained and experienced men. The practice of appointing politicians to ambassadorships and other diplomatic posts cannot continue if America is to hold up its head in the diplomatic world.

The Rogers Bill planned to establish consular and diplomatic services on an interchangeable basis. Young men, with aptitude for the foreign service, may, if the bill becomes a law, enter the consular service with assurance that merit will earn them promotion. The interchangeability feature of the measure is a wise one. It insures individual members of the service against the deadly monotony of routine employment. And it permits the Government to place its men where they will be most valuable.

The consular and diplomatic services should be amalgamated. There is no serious opposition to this proposition. There is no serious objection to the Rogers Bill. Only sheer neglect on the part of Congress can prevent the enactment of this wise legislation.

Look Who's Here

TO PARAPHRASE a bit, it takes a censor to censor a censor. Take George Creel, for instance. Mr. Creel made his name almost synonymous with anathema in war-time when he headed the American censorship activities.

His name dropped out of the prints for some time. Now it appears again. Mr. Creel becomes the motivating influence in the National Council to Protect the Freedom of Art, Literature and the Press. That is a long name, long enough to be deleted, in fact. Reduced to one-syllabled words, it means Creel will wage war on all kinds of bans on free speech.

Mr. Creel's organization does not appear necessary. Propaganda—which is the thing most National Councils peddle—is the greatest argument for limiting the freedom of speech. Propaganda makes people tired. The restrictions, which war-time fervor plus Mr. Creel placed on freedom of expression, have disappeared. President Coolidge's commutation of sentences of the Federal prisoners, serving time for expressions of opinion during the war, was a reflection of national views. The country at this time is solid for its traditional birthright of free speech. It needs no propaganda organization to convince itself of what it already believes.

The Underpaid Public Official

IN ANNOUNCING the "drafting" of Chief Bank Examiner Daniel C. Borden from the public service by the City National Bank of New York, D. R. Crissinger, Governor of the Federal Reserve Board and former Controller of the Currency, pays the retiring official a deserved compliment for character and efficiency. He also calls attention to the fact that the Treasury Department of the United States is a training school whose graduates are always in demand by institutions requiring the best technical help and able to pay for it.

Mr. Crissinger adverts to the general complaint that experts in government employ never receive salaries equal to those offered by private organizations, and regrets the government's inability to compete with outside organizations. He suggests that a compilation of the names of high-salaried executives in private life who have left the service would be interesting.

Mr. Crissinger is correct in his estimate of the value which government technical training has for the individual who can make the most of his opportunities, but even these men of superior efficiency owe something of their success to the facilities provided by the Government, so that the plea of underpay is not justified.

The matriculant at university or college pays for his training, receiving nothing for his time or the work he may do. Upon graduation he has his own way to make. Technical knowledge is acquired in the public service under salary, large for the novice, who must grow to it. When he has acquired sufficient experience, he has the advantage of the college man, who may have chosen the same line, but whose knowledge, however thorough, is theoretical, and whose reputation has yet to be made.

Spindletop to Smackover: Changes in the Oil Game

Type of Worker Met in Strikes of Today Distinctly Higher Than That of Old-time Worker Who Pioneered the Industry

By MAX BENTLEY

THIS is a true picture of the new-time oil field, with the motive of giving a belated credit where credit is due.

Jones No. 1 had been a hard-luck hole from the start. Instead of a drilling operation, its crew of drillers and roughnecks had turned the job into a fishing expedition of weary length. The day that I arrived to see it "come in," there had been a series of mishaps culminating in the loss of the last section of casing which lay hopelessly out of line in a hole already crooked.

The stage was set for as pretty an exhibition of cussing as the connoisseur in that line might wish to hear. As for myself (who had visited the oil fields for a dozen years) I felt myself drawing tense in an attitude of shocked expectancy. (I had known that head driller, years before his promotion. I had known him as the toughest, vilest inebriate that ever straddled a crown block, with a record of lawlessness behind him and nothing but a colorful personality to make our friendship endure through the years.) What he merely said on this occasion was, "Oh, *hell!* Draw her out, boys, and we'll try again." The crew methodically went to work without a word.

Was this an oil field? Well, it was Smackover, and Smackover was, at the time, the leading producer in the mid-continent and the pride of all Arkansas.

What was that alien something in the air? One felt it, instinctively. If the observer were familiar with oil and its development, it immediately obtruded. The picture was familiar, and yet different. What applies to Smackover in that regard applies with equal force to every oil field in this land.

Development of the oil industry has meant a steady improvement in the personnel. The type of oil man is distinctly higher, no matter in what branch he is working. These men are new-type drillers. They are too busy to live the life unrestrained.

Familiar, yet different. The future observer cannot fail to detect it. On the familiar side he will note the same kaleidoscopic motion that made the boom days following Spindletop a fascinating thing to study. He will stop in the same mushroom towns and berate them for their utter lack of even the simplest necessities of life. He will encounter the same careless disregard of comfort. He will appreciate the same rough and easy camaraderie. On every hand he will observe the same all-giving of beef and muscle. He will find his old friends on the rigs still working like dogs for six or seven dollars a day, and he will find them enjoying it in the same old way. The commingled smell of oil and mud will herald his proximity to an oil field before he sees the first outpost derrick. There will be something about it that will make him want to snatch the picture to his bosom and weepingly say, "God Bless Our Home"—yet there will be something else that will impel him to restrain the gesture, wrinkle his nose, take another sniff, and say, wonderingly, "What's wrong here?"

It may be any number of things (styles are forever changing) but the few noted here in this sketch are sufficient in number, and also significant. In the old days, when oil was young, the game had no ethics. The rules had not been made. Oil had no values. Its future as an industry was wholly unknown and unreckoned. The men who were to make the industry were newcomers, recruited from a hundred lines of business and hailing from the farthest far-flung points of the compass. Having no precedents behind it, having no rules of conduct, there was nothing by which to judge oil. It had to make its own rules as it went along. Measured in years, Spindletop is still a comparatively recent discovery, but how utterly remote it seems when one considers the human side of Spindletop!

The oil game in the beginning was cutthroat. The thought is ventured relatively, the term is perhaps too harsh, but to have been an oil man in, say, 1901 was—speaking in general terms—much like having been the lightning rod salesman of two decades earlier. While the brand was impressive as denoting courage and a pioneering spirit, it carried at the same time a certain degree of—well, at least—suspicion. The newspaperman of twenty years ago wandering through the oil fields carried his roll in his shoe—and he was a pretty competent customer, too.

Contemporaneous with the automobile, the oil industry has developed with the same astonishing swiftness. Spindletop and its roaring gushers of ten-cents-a-barrel oil turned out to be a corner stone of an economic structure of tremendous proportions. As a major industry, oil is in its third decade, fully stabilized, run on scientific principles with mathematical exactitude, under a set of rules as iconoclastic as our home bank's rules. In 1922, according to the United States Geological Survey, the reported American production of oil was 551,197,000 barrels which fell short by 35,000,000 barrels of meeting our domestic consumption. Last year we produced at the rate of 620,000,000 barrels a year and consumed at the rate of 672,000,000 barrels a year. We produce sixty-two per cent of the world's oil, and we consume sixty-nine per cent.

What is the human element behind it? The best men of the pioneering days survived the boom and became the responsible heads of large companies, or the responsible drillers. A large city of Southeastern Texas is the home office of two oil companies whose combined capitalization is nearly one-third billion dollars. Many of the executives of those companies were, twenty years ago, roughnecks on the rigs. A certain production official of my acquaintance, whose salary is now $50,000 a year, was, in Spindletop days, a two-fisted rough-house bully.

The type of the oil man is distinctly higher in whatever branch of the industry he may have elected to follow. The uses of oil are manifold, the best brains of the world are grappling with the problem of harnessing the fluid gold that flows fitfully beneath the steps of men—it is a serious business, its growth has been no more notable, in the opinion of one who has observed it nearly from its infancy, than the intellectual and moral growth of those one-time rip-snorting he-men who brought in the first well.

Smackover itself is nothing more than a typical oil field; and as for Smackover, among the causes making it different, although familiar, were noted these:

1. The disappearance of secretiveness and stand-offishness as between oil men themselves.
2. The disappearance of the frank and extensive practice of immorality that made the atmosphere of the old-time oil field a stench in the nostrils of decent people.

For the first there is an obvious answer. Since Spindletop days and on through Sour Lake, Corsicana, Cushing, Goose Creek, Ranger and Homer, the fraternity has learned a bitter lesson from keeping its successes, and more particularly its failures, to itself. More than one oil field has gone to salt water from the mishandling of one well. Then there is the matter of offsetting. At the time of my visit to Smackover it was lawful in Arkansas to drill anywhere one liked. The driller could put down his holes ten feet apart. If he had one, he could sink a siphon pipe shaped like ninety degrees and suck up all the oil under the countryside, so long as the derrick was on his own lease. Therefore it was both desirable and essential from the driller's point of view—as time wore on—to keep his neighbor fully posted on what he was doing and where he was doing it. It was money in his pocket to pass along straight information on the sort of formation he was encountering. It is a common thing in Arkansas for the driller of a successful well to open his log to the driller of every other well in the neighborhood. It is strictly business, you might call it selfish business, but the more a man plays an aboveboard game the more habitual it comes to him to play that sort of game

For the second? Score one for the women. The field man now takes his wife with him. If she cannot set up her domicile within the field itself, she sets it up as near to the field as time and tide will allow—and schools, and churches—and, though it be in the wilderness, makes for her man a good home. Trains through the oil belt are nowadays crowded, morning and night, with men going to work or going home. They, the men, have a well-fed look; on their countenances one notes a certain balm of content, and the car talk is of home and the kids

My reformed driller friend's mild objurgation developed the fact, after a week of visiting among the crews, that vulgarity on the rigs is near to being another lost tradition. The impression is not meant to be conveyed that the roughneck of Smackover is lily-lipped. On the contrary, he is a strong human man who cusses a bit on occasion. Getting right down to it, it is man's historical prerogative in every clime to relieve himself in moderately strong language if he is minded to, as long as no ladies are about. Drink used to loosen men's tongues and make them use profanity that had neither point nor piquancy. Under the influence of drink they "shot off their mouths" without purpose.

Now they swear with more directness. There is a scientific brevity about it as though, from long years of practice, they had learned to cast aside superfluous "cuss words" that were merely vulgar without being expressive, and had made up a new compact vocabulary of only the essential, direct and purposeful words. On a little theory of mine that a strong word now and then is something to acquire, and not shun, as long as it is not vulgar, I would like to illustrate these conclusions by putting down in print, as a gift to posterity, a few of the new, terse, and altogether expressive swear words which one will hear, in this good year, around the rigs of Smackover . . . . But space forbids.

The overwhelming conclusion to be drawn from a study of the human side of an oil field is that the current pessimism on the future of the race is not well founded. These are days of mass motion as distinguished from the time when a man stood forth and gloried in the response of his own body, but you can still cast a white man among savages and gamble with a degree of certitude on the chance that they will name him Heap-Paleface-Always-Bathing. Coming a little nearer home, cast a large group of men into some raw place—an oil field, for example—and watch them evolve a civilization that, for orderliness and soberness and sanity, in due time will meet every demand of the pulpit thunderer. Wherever men of strong bodies and therefore strong passions mingle (and there is no better mingling ground to attract strong men than the oil field) temptation will be their handmaiden. Yet in due time they learn to resist temptation, and go on achieving. There, in the oil field, as elsewhere, they are groping as men have but groped since there were men, but they are groping forward.

The modern oil field is more than a place where oil has been discovered. It is a melting pot of raw manhood, and its brew nowadays is orderliness and not orgies.

Vicious Plays Are Simply the Manhattan Idea

By PETER SCHUYLER

IT IS an extremely difficult thing for those who live outside Manhattan to comprehend the conditions existing in the dramatic and musical comedy theaters which flourish along the Great Shine Way. Just as it is absurd to expect anyone who has never been face to face with the ravages and horrors of a battlefield properly to understand what war means, so it is foolish to expect that those, who do not come in contact with the Manhattan theater in the raw, will grasp the reason for the Committee of Stage Cleanliness which has just been appointed by the police commissioner of New York City. Even what little can be told about it (the reticences of decent journalism insist upon consideration for its patrons) is apt to be received skeptically. Those who cannot see things as they are, because they are fortunately removed from the field of presentation, usually greet an exposition of strange facts with an honest, "Such things cannot exist."

The difficulty which confronts the dramatic critic, who would like to tell the whole truth but who dare not, is that he is in danger of rousing curiosity among the morbid, anger among those who want their reading as well as their entertainment kept wholesome, and resentment among those who do not care to have such conditions brought to their front door. But Manhattan sets the stage pace for the country at large. No matter how we wish it were not so and however vigorously it may be denied by other big cities of the country, the fact remains just the same. The stamp of "a New York success" is the lure used throughout the country to draw patronage to the box office. The city where the "success" appears may later disapprove but the harm has been done. The situation is like this; Manhattan is shown a play whose production rouses opposition. But the opposition never amounts to much and the play continues. Presently another piece is shown which goes a little beyond the first one. It also raises a protest and in discussing play number two everyone forgets all about play number one. If they do recall number one at all it is simply to say that it is not so bad as number two. The result, inevitably and logically, is that the public taste, little by little, is corrupted, and in the end nothing seems indecent, all barriers are thrown down, and every restraint is removed.

They Call It "Tolerance"

THE same thing happens to the city "on the road." One play is halted by the chief of police. Politicians, interested in theater properties, exert their influence to have the chief pulled off. Lawyers get injunctions and mandamuses and all the other weapons of our super-legal civilization to prevent interference with the piece. Things drag along until another Manhattan "success" appears. At once everything is forgotten in the consideration of the latest attack on the decency of the community. Gradually the public taste of the "road" city is blunted. **Each season sees a little further encroachment on forbidden ground in the provinces and a more insistent demand for "tolerance." "Tolerance," in the Manhattan sense, simply means non-interference, by the Law or the decent-minded, with the process of making money by someone who does not care how it is made.** It requires only a superficial knowledge of the history of the Manhattan stage to produce the necessary proof of the truth of what is written above.

Some years ago the late Clyde Fitch wrote a play called "The City." In one of the bits of dialog a drug-maddened boy used the expression which is represented in print by the double dash, "— —." For at least seven days there was a shriek of protest from outraged Manhattan. Then the protest died as quickly as it had arisen. But the entering wedge for realistic speech had been inserted. Manhattan got hardened to that expletive and went about its business of being "tolerant." The next appearance of the oath was in a one-act play given in vaudeville by Frank Keenan, playing the rôle of an unreconstructed Confederate soldier who let it loose when something is said reflecting on Robert E. Lee. Another hullabaloo arose. In some cities the lines were ordered out by the authorities or the theater management. But it went in Manhattan as a bit of artistic realism. Tonight that same oath is used as freely and viciously as the author or stage director wishes. And it doesn't rouse even a gasp from the audience. Public taste not only permits but expects speech of the most blasphemous and profane. A poor "— —" is now considered effete, old-fashioned, and ultra conservative. If it were possible to reprint in these columns a fifteen-line selection of expletives used in current plays it would read like an angry conversation in a waterfront dive.

What is true of the dialog is also true of the stories and the situations of plays. What was a horribly indecent plot five years ago is commonplace today. What was lurid lubricity last season is sensationless this winter. There are at present running in Manhattan upward of fifty plays and musical shows. Of this number almost half deal with subjects (and in language) which should be untouched.

One of the early crop of "shockers" is "The Lullaby" in which Florence Reed is appearing. Edward Knoblock, who wrote "Milestones," a play of altogether different type, is the author. The producer is Charles Dillingham, erstwhile guiding spirit of the New York Hippodrome. The play is a pill, sugar-coated to carry a moral through ten scenes of varying degrees of luridness. A delicious line is printed in the program as a sort of dedication. "To the women that men have forgotten." The bill of the play does not say whether the author of the play got his inspiration from the most popular song of the moment, "You're the Kind of a Girl That Men Forget," or whether the song writer was impelled to dash off his ditty after witnessing "The Lullaby." In any case the idea is the same. In passing it may be stated that the song writer, whose matchless lines,

"When the organ plays 'Here comes the Bride'
You'll be standing outside,
You're the kind of a girl that men forget,"

are now being bawled from every burlesque and vaudeville stage in the land, was recently dragged into court by his wife on the charge of abandoning her and her children.

Steady Hammering Has Effect

WHAT people see and hear in the theater they are very apt to accept as the truth. Ideas they acquire from the stage have a constant bearing on their attitude toward life outside the playhouse. The steady hammering home by playwrights of their pet idea that anything is right if one thinks it is right constitutes one of the greatest menaces to personal and community morals.

Amid the welter of viciousness there are one or two contrasting offerings of decent entertainment. One is "The Nervous Wreck," a comedy of the broadest type built around the character of a youth who imagines he is sick and has to take a pill every two minutes to keep alive. The other is a musical play, "Poppy," in which Madge Kennedy makes her first essay into musical diversion. Miss Kennedy, who was for a long time a favorite in the films and whose charm of manner and wholesomeness of appearance was shown to good advantage in Frank Craven's homespun play, "Spite Corner," is badly handicapped in her new venture. She neither sings well nor dances gracefully. But she looks real and is always intelligent in what she does. W. C. Fields, the comedy juggler, as an old-fashioned circus "grifter" whose motto in life is "Never give a sucker an even break," is responsible for carrying the piece. This is Mr. Fields' first appearance as a speaking actor; his efforts hitherto having been confined to pantomime efforts in the Ziegfeld "Follies" and the vaudeville theaters, but he has made a huge success in "Poppy."

Otto Kruger, an actor with a long list of successful rôles to his score, is the chief destroyer of worry in "The Nervous Wreck." June Walker, as the runaway girl, makes an attractive companion player for Mr. Kruger and she has the uncommon ability of being girlish without giving way to baby-talk mannerisms. Both "Poppy" and "The Nervous Wreck" can be seen by anyone and fearlessly enjoyed.

In connection with the latter play there is an interesting bit of history. Owen Davis, who wrote the piece from a story by E. J. Rath (the pen name of the late Edith R. Brainerd) is the president of the Dramatists Guild branch of the Authors League. It was tried out in Los Angeles where, it is alleged, it was seen by Harold Lloyd, the be-spectacled comedian of the film world, and Hal Roach, who writes his scenarios. Before Mr. Davis' play was produced in New York announcement was made of a new picture "Why Worry," featuring Mr. Lloyd. The plot of the picture was believed to follow so closely the idea of the play that Mr. Davis and the stage producers interested with him talked of taking legal action against the film makers, Mr. Lloyd and Mr. Roach. Conferences were held to effect a settlement of the case and it was thought that an amicable arrangement had been reached. Now Mr. Davis and his associates have sued Mr. Lloyd and his business companions for $150,000 alleging that the picture rights of "The Nervous Wreck" have been damaged to that extent by the film "Why Worry." The case will be watched with interest because it is the first of its kind to be brought on the grounds of direct infringement upon copyrighted stage material by a motion picture producer.

Bingham, Seen Through a Copper Haze

Concluded from page 5

on the east side of Bingham Canyon; there one faces the serried terraces that mark the successive slices now being cut out of the mass of copper-bearing rock. It is an impressive picture of highly organized human industry. The crest has been removed already, but, foreshortened by distance, the mountain still looks like a pyramid, the levels of successive excavation suggesting the step-like cross-section of one of the famous Egyptian tombs. The outer cover of the hill is colored red by oxidation; the mass itself is gray. It is a huge theater in which the actors are 1,800 men; but so big is the stage that they are hardly discernible at this distance. Ore trains, like children's toys seen from afar, run along the levels and black steam shovels vomit puffs of smoke as they dig energetically into the piles of broken rock made by blasting. The smoke from the engines and the little black figures here and there give a touch of the infernal to the picture, but the suggestion is contradicted by the blue sky that canopies the scene."

Only One Per Cent Copper

IT IS a place where one may distinguish sound from sight, for the smoke is seen first by the eye and later the boom of the explosion rumbles across the intervening distance and on over the mountains to be mistaken for thunder twenty miles away. One blast was a loud harsh snap and with its roar I felt the pinch of the air waves against my coat and trousers and my ears hummed for a moment. And that is how the big mountain is being moved away, demolished to be refined for our electric wires and for those other scores of uses the world finds for copper.

But the biggest open copper mine in the world is not all of Bingham even though it does mean that more than 500 carloads of ore are taken up daily, that about 200 million pounds of copper are obtained from this low-grade ore annually, that the ore averages only slightly more than one per cent copper, that a little gold and silver occur worth a cent a pound, that the cost of producing a single pound of copper is only eight cents, that a score of steam shovels and a score or more of dinky engines keep running day and night with never a stop winter or summer. We will not follow the ore to the smelter, for the process is not so complex. The rock is first ground and crushed and screened, then ground and crushed some more until at last it is nothing but dust. Then it runs over wobbling tables where water helps separate some of the ore, while some goes on to be mixed with oil and acid, passes over canvas affairs where air is blown upward to make all sorts of bubbles, millions of bubbles which gather the copper in their films and carry it away from the sediment. Strange that copper should clutch the outside of an air bubble of oil and acid like that, but it does, and that flotation process, as it is called, was discovered by a woman in Colorado when washing her husband's dirty clothes in soapsuds. Yet that process means millions of dollars to various plants in different parts of the world today.

Up to the Mountain Top

WE MUST stay near Bingham, for up a fork of the canyon is a different sort of mine, one which bores into the earth and takes out lead, zinc, copper and silver, and if you cared to explore every one of its drifts (we call them tunnels) and its staupes you would walk more than fifty miles. Into the main tunnel we rode, which is a thousand feet below the top of the mountain; and we went on an electric tram which fairly made me dizzy with its lurching speed. The foreman was holding the lever and in the gloom I saw the green-blue flashes from the cable, men walking with small carbide lamps or waiting for us to pass, pillars of wood flashing past, and when we stopped a half-mile inside the mountain we were in a large electrically lighted cavern. The buckets of the hoist shot up and down at lightning speed, men came and went and we moved away down a drift (tunnel) where the timbers were damp and oozy, and where white mold hung from them like the moss which drips from cypress trees.

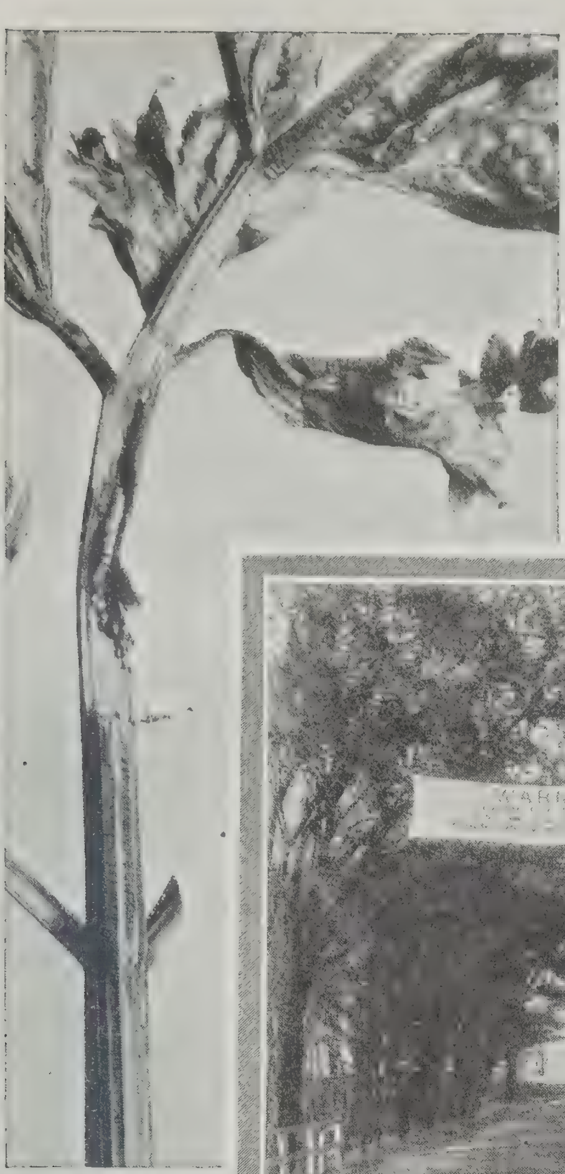
That long walk through the mine seemed to occupy months before we had finished it. We walked along the drifts, we climbed down ladders, we put our hands on hot rocks made hot by the friction of the moving rocks of the mountain, we walked through little pools of water, we stopped where men were drilling holes for the dynamite, we went down the staupes which are great openings where the ore has been dug away; and we threw the glow of our lanterns into dark recesses and sometimes on the clear gleaming mineral of the veins. And after moving that way, after walking under damp ceilings of corridors, after watching those men working with lights like the workers in the smithy of the gods under Olympus, we came once more to the hoist and I was informed that we were eighteen hundred feet below the top of the mountain or over a quarter-mile. Then we stepped on a bucket of the hoist and the wind whistled and whirled past us for only a moment and we had traversed that eighteen hundred feet straight up and stood on the mountain top where snow lay all about and it was winter.

The lights burn all day in Bingham, and I stepped into the big stage and went down the street, past the churches and schools, and all the dwelling places strung on the canyon walls. A little later a copper-colored moon, pale and luminous as a molten ball of cooling metal, swung along the mountain top, while its light shimmered through the copper smoke clouds which always gather about the copper mountain and slip down the canyon to hover about the strange, fascinating town named after a man who once herded sheep over these hills and gullies and whose name was Bingham.

Uncle Sam's Workers Fight European Corn-borer Plague

Quarantine Established to Prevent Spread of Pest But Its Travels Have Carried It Far; Seek to Prevent Its Appearance in West

By UTHAI VINCENT WILCOX



An infested celery stem. The outside has been cut away to show its working in the center of the stalk. Besides the celery eaten there is the loss from breakage and nutrition.

A quarantine sign across the road leading to an infested area at Concord, Massachusetts. It is by such measures that the spread of the borer has been retarded.

OF UNDESIRABLES of all sorts and descriptions caught sneaking into the country, none has caused more concern or damage than has the European corn-borer. The Department of Agriculture has already taken steps to destroy the progeny of Mr. and Mrs. E. Borer, which today are encroaching on new territory and threatening heavy losses to farmers.

"The European corn-borer," said Professor W. R. Walton, Associate Chief Cereal and Forage Insect Investigations, Bureau of Entomology, "came over to America from Hungary and Italy some time in 1909 or 1910, gaining entrance probably in broom corn. Since then it has become entrenched in a widely broken belt of territory from the coast of Massachusetts and New Hampshire on the east through East-central and Western New York to a point beyond St. Thomas in Western Ontario, Canada. In 1920 the total area inhabited by the pest within the United States was about 4,500 square miles. In 1922 this had grown to be more than 7,696 square miles. This in spite of the best efforts of the bureau to confine the infested section to a small area."

It was all explained that Mr. and Mrs. E. Borer had made themselves perfectly at home from 1909 until the summer of 1917. At that time they were found to be causing severe damage to sweet corn in the vicinity of Boston and for at least 100 miles around. Next they were found over in Schenectady, New York, and then in Buffalo and Girard, Pennsylvania. While the machinery of the government was getting under way, Mr. and Mrs. E. Borer spread their children and children's children unto the eighteenth and nineteenth generations along Lake Erie and a narrow strip in Pennsylvania, Ohio and Michigan. These hard-eating pests were headed toward their promised land, the great corn belt. There they could eat and multiply while Americans who liked and lived off corn crops watched and wondered what this plague was.

"There is circumstantial evidence," said Professor Walton, "that the moths may have been blown by the wind across Lake Erie from the intensely infested area immediately south of the Canadian cities of London and St. Thomas. The records of the Weather Bureau show that the prevailing winds blew rather constantly from that region during the flight season of the moths in 1921." There you have a record of immigrant aviation!

Mrs. E. Borer lays fifteen to twenty eggs on the leaves of corn and other plants. (And don't forget that while corn is their aim and for which they are named, they just "love" celery, beans, beets, rhubarb, and are even esthetically inclined toward gladioli, cosmos, hollyhock, chrysanthemums and asters—in fact all herbaceous plants are devoured.) Now these eggs hatch in about a week, and there is a worm which eats the shell of the egg.

Professor Walton explained: "No one seems able to say just why these baby caterpillars should begin their diet with a course of eggshell, but, be that as it may, the caterpillar very soon develops a prodigious appetite for corn and it eats and eats, for weeks on end, only stopping long enough to change its clothes when these become too small for it."

From a gormandizer at an inch and one-eighth in length it sheds its skin for the sixth time and curls up into the pupa or resting stage. In two weeks more there is a more or less beautiful moth. Unlike the traditional moths, it cares nothing for the bright lights, preferring to fly about, laying eggs.

"There are two generations in a season," says Professor Walton, "and the first hatching is an average of 386 eggs each and the second 550, so if we assume that they were equally divided as to sex and all survived, the progeny or children of one pair of moths would amount to 53,075 at the end of one year, while in two years their numbers would attain to no less than 2,816,406,625 worms! Of course," he added, "many enemies intervene; otherwise we should soon be compelled to give up eating our natural food and subsist upon corn-borer caterpillar 'en casserole,' 'à la Maryland,' or in some other form for the rest of our lives, or as long as we could stand it!"

"Why not poison it?" "Gas it?" or something, you ask? But, ah! this immigrant works inside of the corn and celery and the other plants so that it is ofttimes difficult to detect it until it has destroyed practically everything but the outside shell. Because of this, spraying and poison will not reach it. Ordinary methods do not help much.

This eminent entomologist then told of the experiments of the Federal Horticultural Board: "The weak link in the chain of the creature's existence is the fact that it spends the late fall, winter, and early spring months as a caterpillar within the stems, rootstalks and stubble of the plants upon which it has fed during the previous summer. Thus it seems obvious that if these could be destroyed or so treated as to kill the insects contained therein the desired results would be accomplished."

But all this is easier said than done, for the cornstalks or weeds or grasses must be made into ensilage or completely burned or buried at least six inches underground.

Now the Department of Agriculture, in co-operation with the state extension forces, is carrying on an intensive campaign of education among farmers, florists and truck gardeners, to explain methods to be used to keep the pest in check. Then there is a rigid quarantine measure that prohibits crops which the borer favors from being sent from an infested area to any other part of the country. But a quarantine on wind and weeds is not so easy, and the mere carrying of flowers is dangerous.

Of course the big danger is that the borer will reach the corn states of the Middle West. The very real commercial loss suffered by all sorts of farmers and gardeners in New England gives a chance for a healthy chill when contemplating Mrs. E. Borer and her children nicely settled down in Iowa, Kansas and the other states.

"What's to be done?" we all ask in a more or less helpless way. In reply, Professor Walton declares, "that the extermination of this new pest is beyond the pale of possibility, and the question is, how can it be repressed and restricted to minimize the damage it can do?"

But to minimize means a great deal, for it is explained that during 1921 in one section of New England in a heavily infested acre of Longfellow flint corn, every stalk of corn in the field contained the borer, with an average of eleven borers to the stalk. The ears, too, were nearly as highly infested as were the stalks, ninety-six per cent containing borers with an average of three borers to each infested ear.

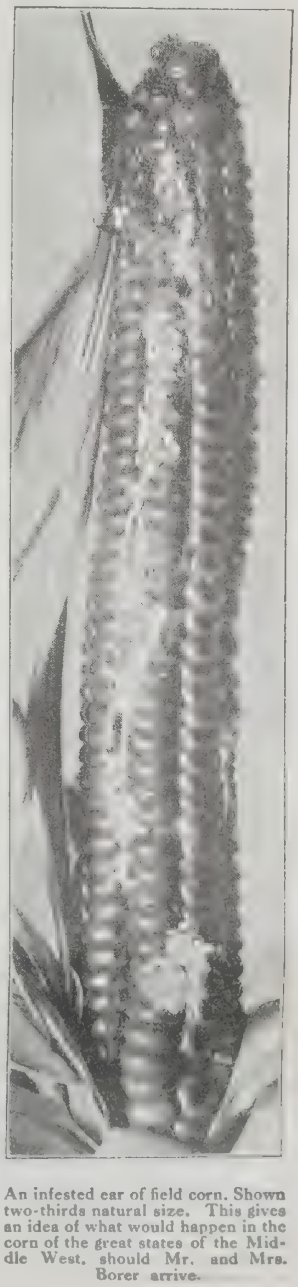
Mr. Walton said: "In a field-corn growing region where the insect has almost certainly been present for about ten years it occasions a direct loss of about two and one-half per cent of the kernels of all the ears. There is in addition to this an indefinite amount of indirect loss due to defective nutrition of the ears caused by the boring of the worms in the stalks as well as by breakage of the stalks. This is on the basis of the pest breeding once a year, but in the corn belt we should double this estimate and assume that the loss might reach seven per cent of the grain in two-thirds of the crop. That would mean an enormous loss in money with a crop such as was produced in 1920 of more than 3,000,000,000 bushels. At a possible market price of eighty-five cents a bushel this loss would reach the enormous figure of $119,000,000!

"We have disregarded the fact that these estimates were based on regions where the pest has been permitted to multiply unrestrained for a period of ten years. So this cannot happen in the corn-belt states now that we know the habits of the borer, and for this reason the losses which it could inflict undoubtedly would be greatly reduced.

"The work of introducing the natural enemies of the corn-borer from Europe has made rapid strides during the past year. Experts located at Hyeres, Southern France, have been constantly collecting and shipping insect parasites of the corn-borer to America where they have been assorted and reared to be subsequently liberated in large numbers in the heavily infested regions. More than 1,000,000 specimens of a single species of parasites have been liberated in this manner during the summers of 1922 to 1923 and thousands of individuals of other kinds have also been liberated."

The Bureau of Entomology is to continue this work and has even taken these parasites down to the South Atlantic and Gulf States so that they may be present if the borer should spread to these regions. So the stage is all set for the battle of the century, with the American farmers holding the stakes and the fighters killing each other off but the villains dying in greater numbers.

Other measures are being advocated to help out. Professor Walton told of experiments with weed killers and ensilage and silo methods and the preparation of new insecticides. "Every possible line of research which may lead to means of control is being followed up."

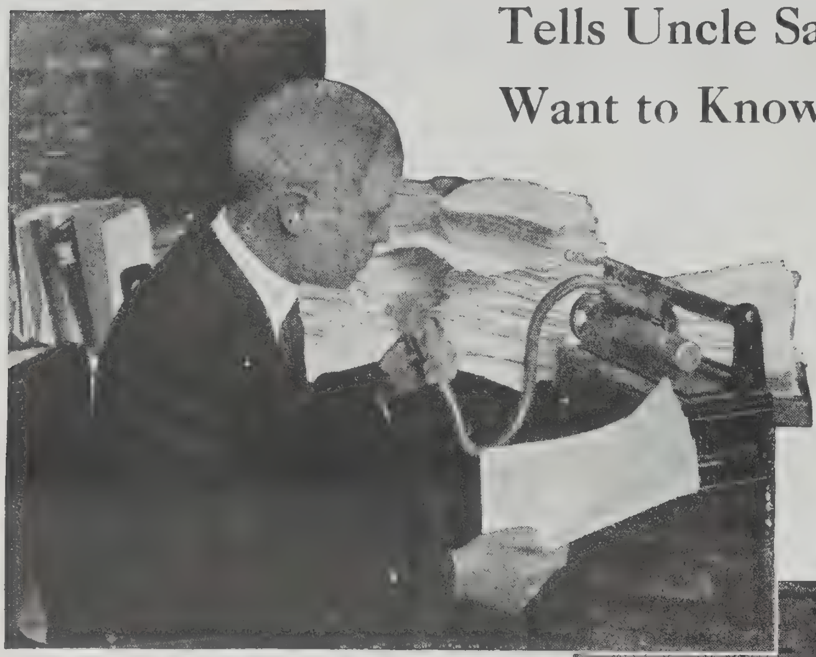


An infested ear of field corn. Shown two-thirds natural size. This gives an idea of what would happen in the corn of the great states of the Middle West, should Mr. and Mrs. Borer arrive.

His Life Just One Answer After Another

Tells Uncle Sam's Nephews and Nieces What They Want to Know; Answers 100,000 Queries Annually

By GEORGE H. DACY



STUART B. STONE,

Who replies to 100,000 letters each year.

HOW would you answer 100,000 inquiries a year on every conceivable mining subject—how to locate gold mines or other precious metals with a divining rod, how to find oil wells with forked sticks, how to seek out the buried treasure which Spanish pirates, centuries ago, deposited in the sands of the Floridan Keys, how to recover gold from sea water, how to discover platinum ore where there is no ore, how to locate "salted" silver mines, how to disclose the "doodle bug" game and even how to regain the love of your divorced wife?

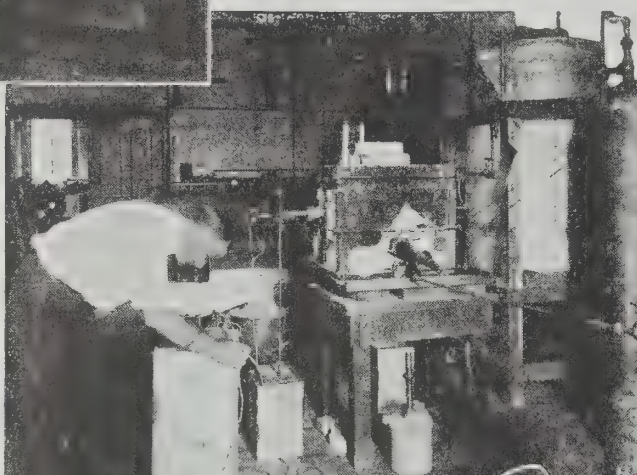
There is a government official who each year replies to thousands of letters of inquiry sent in from all parts of the United States on a multiplicity of subjects. Many questions are as absurd as the foregoing. Uncle Sam's daily mail is flooded with extraordinary "nut" letters and Barney Google-like inquiries.

In a certain bustling office in the Department of the Interior Building in Washington sits a modest, accommodating, low-voiced, pleasant-spoken man who answers questions for Uncle Sam and the Bureau of Mines. His name is Stuart B. Stone. He is known popularly among Washington newspapermen as an outstanding information expert who answers any and all questions as thoroughly as would the encyclopedia and with the reference accuracy of the dictionary. Mr. Stone has to know more than is found in the ordinary college curriculum.

His daily mail is as voluminous and varied as the catalog of a leading mail order house. He receives letters from sections of the Arizona desert where it is so hot that one can fry eggs by employing the midday sun as fire. Other letters come from the fur-coated Northland where the mercury is below zero on the Fourth of July. From the lowlands of the Mississippi Delta, from the highlands of the Adirondacks, from the hamlets of Northern Wisconsin and from the cities, the postmarked questions flow to our national capital. There in Stone's simple office they are read and answered with efficiency.

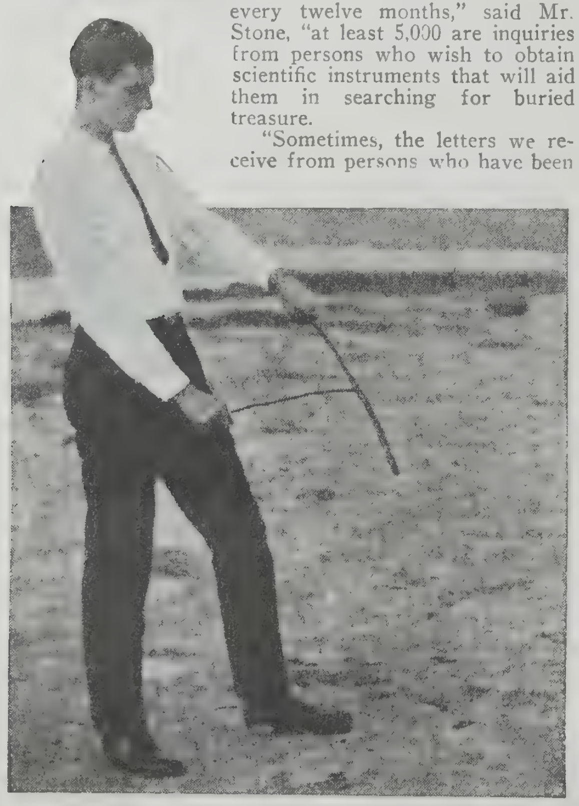
"Of the 100,000 letters which I receive and answer every twelve months," said Mr. Stone, "at least 5,000 are inquiries from persons who wish to obtain scientific instruments that will aid them in searching for buried treasure.

"Sometimes, the letters we receive from persons who have been victimized by fraudulent investment schemes result in Federal investigations and the permanent dissolution of the swindling enterprises. An innocent investor recently reported the loss of a large sum of money in the purchase of stock in a platinum mine supposed to be located in the neighborhood of Yonkers, New York. The swindlers sold stock in a mine which they asserted contained ten billion dollars' worth of platinum Considering that the entire annual production of platinum in the United States is less than 1,000 ounces, one can easily appreciate the daring of this fraudulent project which was investigated and exposed, subsequently, by government representatives.



Assaying minerals at Reno, Nevada, experiment station of the Bureau of Mines.

"Where can I purchase a reliable divining rod for locating buried treasure and mineral wealth?" is a common question asked of Mr. Stone.



Inquiries are received about the use of a forked stick to locate oil wells.

"Some years ago," said Mr. Stone, "we were successful in running to earth another gigantic fraud perpetrated by a Maine minister. He sold many thousand dollars' worth of stock in a company formed to recover the many, many millions in gold that are suspended in the ocean water of the seven seas. We were deluged with inquiries from Maine about the scientific possibilities of this scheme. That was how Uncle Sam entered the scene and disrupted the profitable operations of the preacher.

"It was learned about a half-century ago that the sea water contains infinitesimally small amounts of gold. Science immediately surveyed the possibilities of recovering this gold. It was established definitely that one ton of salt water contained between two and four cents' worth of the precious metal. The chemicals needed to recover this gold from the sea were more costly than the value of the treasure which could be reclaimed from Neptune's coffers. Notwithstanding, from that day to this, clever promoters, ever and anon, drum up bogus campaigns to salvage these vast nautical supplies of gold. Credulous speculators invest and pay dearly for their experience."

Only a small part of the mail which Mr. Stone handles consists of "nut" letters. The Bureau of Mines publicity service is also handled by Mr. Stone, who sends out stories of epochal achievements by his department. Recently, a release which he got out concerning the conserving of the householders' coal supply by making the furnace work more efficiently resulted in 15,000 letters of inquiry for more detailed information.

One exposé which Uncle Sam made as a result of inquiries regarding certain fictitious western gold mines brought the detection of a most ingenious system to "salt" a worthless prospect with gold to attract investors. The fraud in question consisted of lowering a small cannon into the depths of the mine and using it to shoot slugs of gold into the neighboring walls. Prospective investors who visited the mine thereafter could then examine the veins of gold that had been shot into place and could even take samples which, subsequently, they could submit for analysis to assayers.

Hundreds of letters inquire whether Uncle Sam makes free assays of ore at Washington. Dozens of samples of iron pyrites—fool's gold—are sent in for analysis. People find the bogus ore and nuggets and without giving any thought to the geological topography or conditions, mail the specimens to Washington and dream sweet dreams of future fortunes as they await a reply from our venerable national relative

At Reno, Nevada, the Bureau of Mines maintains a free assay service, the only project of its kind in the country. Ore samples such as platinum, tin and chrome are tested. Samples of gold, silver and copper are not accepted. It is because of the desire of the authorities to increase the supply of rare ores that the Reno station makes tests.

Sackfuls of mail have come from Colorado, Wyoming and adjoining states where approximately 150 different companies are selling oil shale stock. Some of these promoters maintain that the deposits of shale which they offer are also rich in gold, silver and platinum. A few salesmen claim their shale will yield as much as eight dollars gold to the ton in addition to the deposits of oil. All of this is pure faking The Federal investigators have carefully surveyed the oil shale zones and report that the richest gold-bearing ore that they found contained only twenty cents' worth of the precious mineral a ton.

Uncle Sam says that when the price of gasoline ascends to a point where the fuel sells for thirty-five to thirty-seven cents a gallon, it will be profitable to mine the oil shales and by distillation methods recover the oil they contain. There are many reputable oil shale investments on the market but there are many more of the mushroom type which make the most extravagant claims and which should be avoided. The Federal experts of the Bureau of Mines report very decisively that they do rot believe that American oil shale will ever be a commercial source of any precious metals.

Mr. Stone has composed and uses more than 1,000 different form letters in answering inquiries. These form letters give some idea of the vast variety of questions which he receives. The letters are worded in simple, definite and sympathetic language. All other inquiries are handled in a similar vein by personal reply in case form letters do not cover the desired subject matter.

During the World War, the Bureau of Mines received an almost endless chain of post cards from Memphis, Tennessee Each card was written in red ink and contained from 200 to 300 words copied in sequence from the dictionary. Postal detectives were recruited to solve the mystery. They traced the curious cards to a demented Negro who imagined that Uncle Sam had abused him and who took this remarkable method of obtaining revenge on the government.

Letters are received from substantial and well-educated business men who wish to hunt for buried gold and lost treasure. They inquire if Uncle Sam knows of any magnetic tools, dip needles, divining rods or mine finders which will aid them. They inquire further as to whether the government makes any such contraptions.

Thousands of letters are from miners To the miner, the Bureau of Mines and Uncle Sam are often synonymous. All his ideas of government are centralized in the Bureau of Mines. When he wants information he writes to the Bureau of Mines. His query may be: "How many potatoes does it take to plant an acre?" or "What baseball nine won the championship of the National League in 1910?" One miner, recently, wrote that he was having trouble with his mother-in-law He wanted Uncle Sam's assistance in placating the irate lady. Still another miner inquired how he could make up with his divorced wife.

Mr. Stone accords his careful attention to each and every letter. If he himself cannot give the information he refers the inquiry to other experts. He sees that every question is answered as soon as possible. In all Washington, no national official is busier.

The Memory of Eden

By ARTHUR GLASBY WALKER

LAST summer I looked over the black wooden fence into a city back yard, small, of course, as city back yards are. It was not a back yard at all, or, rather, it was; it was transfigured. Almost every inch was occupied by some miracle of nature, not less miraculous because common. It had its tiny beds of lettuce, onions, carrots and even a little square of potatoes. But best of all, it had a good and varied show of beautiful flowers. Tall hollyhocks, scarlet runners and Virginia creepers made the fence a wall of living green, adorned with the spear-like hollyhocks of many colors and rare beauty. There were small beds of geraniums, pansies, phlox and other familiar flowering plants. By the porch steps two or three bushes of rambler roses were blushing with the richness of life.

I asked a black-eyed son of Judah who lived there. He was tossing a ball and answered in a casual, good-humored way, "Three old maids." "What do they do?" I asked. "Nothing, too old, and one of them always sick," he answered. So almost everything had faded and much, very much, had been denied, but at least something was yet young, the love of the beautiful, the racial memory of Eden.

This memory of Eden is a strange thing. It is unkillable. Whether it express itself in the elaborate hanging-gardens of ancient Babylon or in two or three struggling plants in the window of a tenement in the sordid entanglements of a city slum, the spirit is immortal. You may bury civilization after civilization, you may debase humanity until there is little apparent humanity left, but Eden springs eternal. There are those who tell us that Eden is only a tradition, but I know it is history, because it forever repeats itself. Experience, as well as observation, confirms me in the dogma. As I turned away from the garden of the three old maids I saw another. It is many years since I saw that one. I was then a small boy, but in that moment I saw it all, every detail, as if I stood in the very plot.

A Day in June

IT WAS a day in June; that explains much. I went with my father to the garden, which was quite a distance from the house. This was a treat because his work made the opportunities rare. On the way he excited my curiosity by telling me he had something to show me and of course I became very eager. There had been a sharp shower of rain but the sun was again shining brilliantly.

We passed a group of cottages and then, confronting a high stone wall, we slipped round the end of the last cottage to find a narrow alleyway. I have always wondered why that high, strong wall? Built of stone, ten feet high, with rounded copings, it was probably a hundred feet long. Passing down the alley at the extreme south end of the wall was a door, like a house door, let into the wall. Inside was an easy slope, on either side a narrow hollow bounded by an old hedge of every conceivable growth; hawthorn, wild rose, bramble, woodbine, honeysuckle and a hundred others. At the bottom was a little stream with stepping-stones and a grassy bank beyond.

It was to this bank father led the way, we moved softly through the long grass, father imposing silence upon my tongue; then he gently pushed aside a branch, and there, snug in a fork of young shoots, was the neatest little nest and four tiny blue eggs. A linnet near by stopped singing, so we quickly retreated, for father suspected that the owners had seen us and were alarmed. I have seen many birds' nests and eggs since then and always admired them, but the outstanding one is the linnet's nest I saw that day. The beauty of the form and the wonder of that blue spoke straight to my childish sense of the mysterious and beautiful.

The "Burning Bush"

LOOKING up the garden from the bank of the stream was a patchwork of the wonders of things. Everywhere something was growing. From the top of the garden, near the door in the wall, ran an old-fashioned flower bed, reaching from the door, the length of the wall and four feet wide. The bed itself was a riot and confusion of beauty and perfume. The shower of rain, succeeded by sunshine, had released every variety of fragrance and every tone of color. In a cluster were the herbs so prized by mothers of those days.

But the flowers! What a profligacy of life and beauty. Bees were prying into every blossom and butterflies flitting and waltzing with all the look-at-me airs of the modern flapper. I know not how long I bent over those tiny wonders or with what happy liberty I stumbled or meandered along, but I suddenly became conscious of two things: that I was at the top of the center path leading down the garden and that I was standing in front of the big white rose bush, which in that border exercised a royal dominion. I think this was the first time I was able to image "the great white throne" of which I had heard in church. It was covered with hundreds of pure white blooms, a garment so complete that only enough green stole out from the hidden depths to relieve the pearly whiteness.

That was an epochal moment to me, though I could not have defined it then. It was the "burning bush" of Moses of which I later heard in church. My soul awoke and responded for the first time to the call of natural beauty. The memory of Eden, preserved through all the generations of my forbears, had been deposited in me also as an inheritance.

Harlem Ministers Act to End Jewish Bootlegging Activities

By LLEWELLYN SMITH

The writer is a Negro sociologist interested in the larger aspects of America's racial problems. During the war he conducted a series of investigations dealing with the growth of radicalism among the Negroes. At present he is on the staff of a social service organization, national in its scope, which is devoting a great deal of attention to the study of some of the basic contributing factors to the so-called Negro problem.

IN ITS campaign to end Jewish exploitation of the Negroes of Harlem, the New York *Age* enlisted the co-operation of Police Commissioner Enright, who issued a special order that "police inspectors and captains are to be held personally responsible for the closing of every bootleg bar in the city."

This order climaxed the sensational disclosures made by the *Age* that "hooch selling" in Harlem is controlled by a Jewish triumvirate—Loui, Hymie and "Chief."

The *Age* charged that the only outsider who had bid for a share of the "hooch" business, by opening a place on Lenox avenue, next door to one of Loui's delicatessens, was given short shrift, even though he employed a Negro of extensive acquaintance and wide experience as a bootlegger.

In spite of the commissioner's order, however, the "bootlegging gentry" are still as active as before. According to a survey made by the writer in the area along Lenox avenue, from 129th to 144th streets, east and west sides, there are twenty-four hooch-dispensing joints which present a much more innocent front to the world than is disclosed by a more intimate acquaintance with the real business. The number of delicatessens and cigar stores which mask the selling of hooch is constantly increasing. A current rumor through Harlem is that a group of brothers, all of one family, and all Jews, practically control the Lenox avenue trade.

A sinister development in Harlem is the invasion of Seventh avenue and the consequent impairment of that thoroughfare's desirability as a residential locality. People are viewing with alarm the opening on Seventh avenue of a number of these hooch joints, most of which are being operated by the same Jewish groups. Where formerly there were none of these resorts on Seventh avenue there are now at least nine in active operation, with two more nearly ready to start business.

This does not include the saloons which are holdovers from pre-prohibition days. The Seventh avenue operations are conducted mostly in the guise of lunch rooms or cafés.

Harlem Ministers Act

THE *Age,* commenting on the campaign, remarked: "The campaign of the *Age* against the hooch bootlegging joints continues to meet the approbation and win the endorsement of the better element of the community. Among the communications it has received, some contain direct charges with relation to a cabaret recently opened which, if containing any elements of credibility, reveal a condition more reprehensible in many respects than most of the developments following the unhampered sale of vile bootlegging hooch in Harlem.

"These charges relate to the alleged meeting of 'leading society women' and their 'sweethearts' in this particular cabaret, one of the letters naming several well-known ladies of Harlem who are said to have attended a 'reception' at this resort, 'mixing with sporting women and gamblers.' The writers unite in urging that the fight for the abolition of these hell-holes be waged until they are finally done away with.

"One long and interesting letter, signed, 'A Reader,' is prefaced by the statement that 'the writer is a white person engaged in social work among the colored people. My sympathies are entirely with these good people in their uphill struggle for recognition, and in whatever way I can I am always ready, willing and eager to further and help them realize their ambitions. The *Age* is fearless in championing the cause to which we are pledged and I am sure its influence for good is far-reaching. I can frankly say that my interest in the colored race has been deepened and even fanned into enthusiasm by the perusal of the splendid sheet of which you have the honor to be editor . . . . It was with much gratitude that I noticed how consistently your paper has fought against the detrimental influences that have arisen among the colored people of Harlem, namely: pool rooms, hooch parlors, fake delicatessens and in this week's issue, against the fake spiritualists, quacks, root and herb doctors, and so forth. The campaign is splendid. Keep at it.'

"In connection with the same cabaret to which the above references are made a resort recently licensed, some of the visitors to the place report that on entering they were accosted by one of the half-dozen brothers who seem to be connected with its operation, most of whom are well-known figures in the Lenox avenue bootlegging delicatessen and cigar stores, and asked if they were making their first visit to the place, and if they were friends of 'Fred R. Moore of the *Age*.'"

Certain Negro leaders have permitted themselves to be used by the Jew bootleg ring in endorsement of the operation of resorts, accepting in return blandishments which are said to have been of a substantial quality.

Many Harlemites ask: Why are these outsiders —these Jews—permitted to come into this particular neighborhood and operate ventures which only debauch and debase? It is bad enough, say these people, for men of the community to profit from catering to weak or vicious inclinations, but it is immeasurably worse to have those, who are in no wise connected, do this thing.

The boldness with which these people carry on their illicit trade brings back again and again the thought that someone in authority must be aware of their actions, and, if so, why is it they are permitted to carry on?

Aroused by the *Age's* revelations, the colored ministers of Harlem, members of the Interdenominational Preachers' Association, in a regular meeting of that body, adopted unanimously resolutions embracing pleas for the elimination of hooch. The resolution also provided for the functioning of a committee on morals to suppress the sale of liquor and poisonous and habit-forming drugs. The members of this committee are the Reverends F. A. Cullen, Richard M. Bolden, G. M. Oliver and John W. Robinson.

Tells of Pay-off Station

AT A Sunday service of the Abyssinian Baptist Church, a $350,000 concern, of which the Rev. A. Clayton Powell, one of the ablest ministers in Harlem, is pastor, two thousand persons gave expression to the church's attitude by adopting the following resolution:

"The Abyssinian Baptist Church has viewed with great satisfaction the strong and courageous fight made by the New York *Age* and other decent agencies against the illegal sale of poisonous liquors in Harlem . . . . The church hereby pledges its hearty co-operation with the *Age* and all other citizens in the driving of these bootlegging and hooch-selling joints out of Harlem . . . . Adopted by the congregation of 2,000 persons, Sunday, October 14, 1923—A. CLAYTON POWELL, Pastor; DOROTHY DEANCEY, Clerk."

The success of the Jews in the Harlem bootlegging trade has inspired others to try their luck. A group of Italians has entered the field. It is headed, according to the *Age,* by two brothers, and these brothers are running some nine or ten places. The Italians, however, are not so ingenious as the Jews. They do not camouflage their establishments, but give them more the semblance of the pre-Volstead saloons. The old brass rail is in evidence, and the back bar is glittering with glass and sparkling with various bottled goods.

In November the police were active in arresting violators of the prohibition law. *But it is worth while noting that the arrests that were made were usually of operators who might be termed "free lance" fellows, that is, those who are not in alliance with the ring.*

On November 17, the *Age* felt that "if the bootlegging of alcoholic liquors in Harlem is to be stopped, some other enforcing agency than is functioning at the present must be called into action."

The *Age* tells of the main "pay-off" station, where law enforcement officers, from various departments, draw largess for their connivance in ignoring the Volstead Act. The *Age* said it was informed by qualified witnesses that on several occasions officers, both local and otherwise, have been seen to call at the "pay off" station and it is alleged to receive money.

The *Age* informant declared that he witnessed the payment of money to two revenue agents, and that there was no effort to cover up the transaction. On another occasion, he said, officers found money placed on a counter in the back room in anticipation of their coming, and that they were seen to go in and pick up the currency, immediately coming out and bidding the bootlegging personnel a pleasant good night.

Law Enforcement a Joke

THERE is really no way, it seems, of curbing the Jew bootlegger in the "black belt," for with all the fighting and agitating and protesting that has been and is being carried on by the Negro welfare agencies the Negroes, it seems, are powerless to end the crime and debauchery. In the first place, **not a word of the activities of Jew bootleggers in Harlem ever creeps into the New York dailies. Last August the *World* started a series of articles on the predominance of gamblers, fake doctors, charlatans, "spiritualists," quacks, voodoo doctors and other scavengers festering in the Negro belt, but these for some reason were abruptly and mysteriously withdrawn.**

The community is degraded and debased by the poisonous hooch and up to the present time there appears to be no escape from the graft that dominates the operations of the notorious bands that have made law enforcement in Harlem a joke.

Harlemites believe, however, that Federal authorities can remedy these conditions by sending agents who will not succumb to bribes. If these agents are backed up by the government and given proper support, the situation could be cleaned up in three weeks, it is declared by those who have investigated the situation.

Builders Bidding Defiance to Earthquakes

If Ground Is Carefully Selected in Respect to Fault and Right Materials and Design Chosen, Damage Can Be Prevented

By HARRY H. DUNN

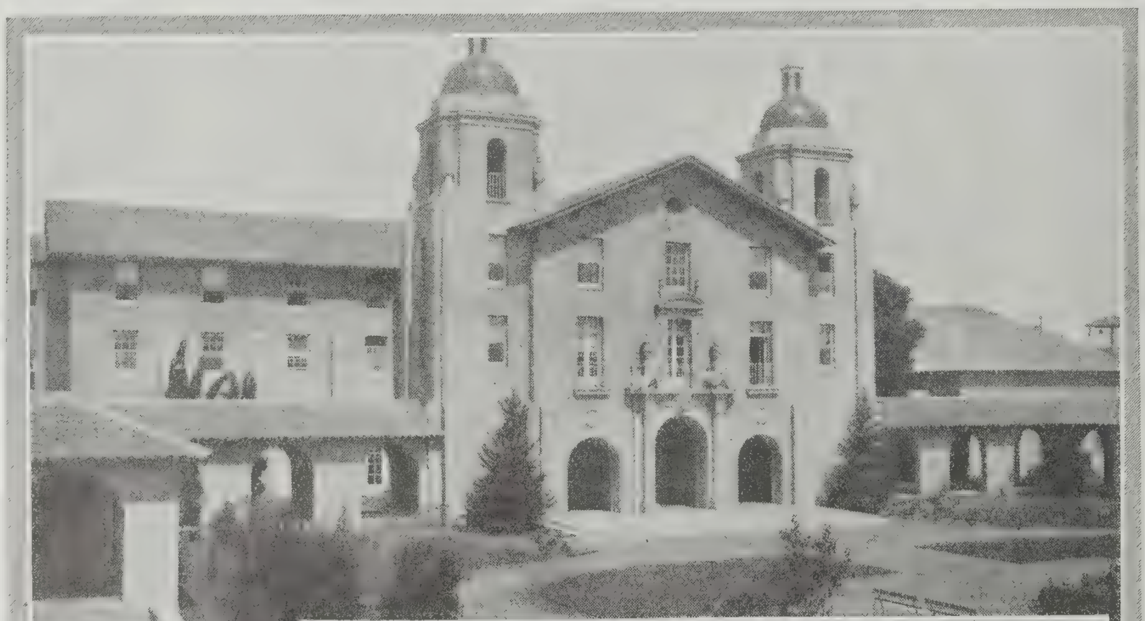
EVER since the first earthquake terrified primitive man by hurling jets of blazing gases before his startled eyes, and helped him to greater safety and better food by giving him fire, the human animal has been seeking some method whereby he could protect himself from these twistings and shakings and upheavals of the crust of the earth. Today, at the end of the first quarter of the twentieth century of recorded time, and possibly five million years since the first man felt the first shrugging of the shoulders of this globe, he has discovered how to erect buildings so that the chances are approximately twenty to one that they will remain standing when the temblor has done its worst Earthquakes in Mexico, California and Japan, destructive alike to life and property, have left unharmed structures built in the location and of the designs stipulated by American engineers who have studied seismic forces and their effects on man-made edifices.

It is generally agreed among geologists, seismologists, geographers and astronomers, that there are three kinds of earthquakes, classified according to their causes, but all resulting in approximately the same kind of motions in the earth's crust, and one about as destructive as either of the others. The first, and probably the most common, is volcanic in origin. Of such was the temblor which resulted in the Mont Pelee disaster, and another which devastated a number of towns and villages in Mexico when Colima Volcano went on the rampage in June, 1911. These volcanic quakes usually are limited in area, but extremely violent, and likely to be more destructive to life and property within that area than are either of the other two kinds.

Second on the list is the earthquake caused by the breakage of the earth's crust when the latter is strained to its ultimate point of endurance by the constant northward movement of that crust. This is known as the "elastic rebound" theory, and was responsible for the earthquake of 1906 in Northern California, and for other earlier quakes in Chile, Peru, and Southern California. As previously described in this magazine, the earthquake caused by strain creep of the earth's crust can be forecast with considerable accuracy by the measurement of this creep and the analysis of the composition and resistant strength of the earth's crust. This is the form of earthquake which leaves deep and jagged furrows, known as "fault-lines" in the surface of the earth, and which usually, at rather regular intervals, repeats itself along these faults.

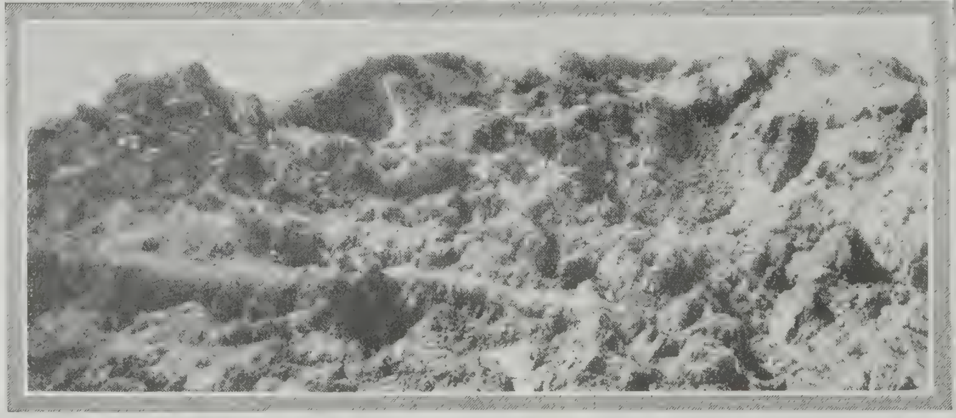
The third kind of quake is due to the seepage of the waters of the ocean through their beds into the hot interior of the earth, where steam of such amount and power is thereby generated as to cause upheavals in the crust of the globe. It is quite generally believed that the recent earthquake in Japan was due to this cause. The Tuscarora Deep, a gorge in the bed of the Pacific some four and one-half miles deep, lies just off the Japanese coast. The pressure of the water at the bottom of this gorge is, of course, tremendous, more than sufficient to drive the water at the bottom through a bed of granite. The forcing of the water into the heated interior of the earth is slow, accounting for the passage of time between earthquakes.

Earthquakes are most prevalent along the coasts of continents, and especially those coasts on which high mountains rise near the sea. The Sierra Nevada, along the Pacific Coast of the United States, is still rising, and is lifted a few inches each year by seismic forces. The Andean chain, running along the Pacific Coast of South America, is believed to have attained its greatest upthrust, and to be now slowly sinking, aided by frequent earthquakes. The main island of Hondo, Japan, is still in the making, and, according to seismologists, will be the object of other attacks by Pluto, or whatever god may be in control of the underworld.



Above—Stanford University was seriously damaged by the earthquake of 1906, and is building such new structures as may be erected on the campus after the most approved earthquake-proof plans. Here is one, on the Stanford Quadrangle, designed on the Mission style.

Photo by Francis P. Farquhar.



Above—The Palisade Range, crest of the Sierra Nevada, which, at a height of more than 14,000 feet, is still being pushed higher by the internal forces of the earth. Below—The effect of a miniature earthquake in the crater of Lassen volcano, in Northern California. On a small scale, this upheaval and slipping of the crater wall shows exactly what happens when the crust of the earth slips along faults many miles long, as it did in the California earthquake of 1906.

It is necessary to know this much of earthquake lore, the better to understand the methods whereby cities may be protected from seismic disturbances, now and in the future. A means of forecasting earthquakes has been devised by Professor A. C. Lawson, of the University of California. Professor Bailey Willis, of the department of geology of Stanford University, has completed an earthquake map of California, on which is shown every fault, no matter how small, along which earthquakes are likely to occur in years to come. This map is to be studied, in connection with similar maps of other sections of the earth in which earthquakes are prevalent, by the Seismological Society of America, with the object of informing all nations of the kind of building most resistant to that particular form of earthquake which is most likely to shake their lands.

The construction of earthquake-proof buildings depends on two factors: First, location of the sites for the buildings with respect to "faults" and to the character of the soil; and, second, materials used, and designs followed in building the structures themselves. Professor Willis, in reporting his lifelong study of earthquakes and their causes, defines a fault as follows:

"A fault is a break in the rocks, usually miles long, and penetrating to a depth where the rocks are firmer and more elastic than they are near the surface. An earthquake is an elastic shock which originates on a fault where the rocks have been held by friction, under increasing strain, until they yield. Slipping suddenly, like an elastic spring, they send vibrations through the globe. Attention has been called on the earthquake map to certain rifts along which shocks of greater or less violence may be anticipated. The rifts are facts, and their movements are as certain as thunderstorms in New York in early summer."

While it is obvious that Professor Willis holds to the elastic rebound theory of earthquakes, his studies and their results are equally valuable for all three classes of earthquakes. The mapping and forecast of these shocks is as far as the scientists go; we must turn to the engineer and the architect for those methods of building location and construction which will prevent or limit destruction of property by seismic disturbances. A successful example of this form of construction is shown in the Imperial Hotel in Tokyo, Japan, which stood through the recent disastrous quake there and is still standing in virtually undamaged condition. It was designed and built by Frank Lloyd Wright, an American architect, and credit for its survival is given to the foundation design which he worked out. The hotel was erected on concrete piles set into the soil eighty feet, but not anchored to the bedrock. The yielding soil above this solid rock formed a cushion which disseminated the force of the quake, and the rebuilders of Tokyo are taking advantage of this lesson in the erection of the new structures there.

In Mexico City, where there is an average of an earthquake shock a day throughout the year, these shocks are minimized, and rendered almost unnoticeable by the fact that the city is built on the filled-in beds of two or three lakes, this filling forming a soft yet compact cushion, into which piles or rafts of concrete are sunk, and the business buildings erected thereon. This mud—really green peat—cushion smothers the shocks to such an extent that the buildings sway with them and are neither toppled nor shattered. In the San Francisco earthquake in 1906, photographs made just as the following fire started, show that the business buildings of cage construction, that is, built of steel frames and concrete, were standing, virtually undamaged, until the fire struck them.

The engineer and the architect recognize three well-defined grades of earthquake effects: First, destructive movements of the earth's crust and near-by buildings along a fault line; second, surface movements in soft deposits, such as river banks, marsh and swamp lands, sand hills and artificially made ground; and, third, vibration in rock and other hard, solid and coherent deposits. These grades have been worked out by Professor Charles Derleth, Jr., dean of the College of Civil Engineering of the University of California. Discussing them with the writer, Professor Derleth, who has devoted more than a decade to the study of earthquake-resistance construction, said:

"Obviously, earthquakes may and do occur which will wreck any structure known to man. This at least is true in heavy earthquakes near the center of disturbance. It is also largely true at considerable distances from the center of disturbance, where soft deposits are moved like jelly in a bowl. This leads to a clear distinction between two types of earth movements: First, motions which result in differential displacements of the ground; and, Second, vibrations with no appreciable unequal movement of the foundation site. Where the ground is moved unequally near the fault line, or on a waterfront, a structure situated there had to be ruptured, more or less. Where a building is vibrated on hard ground, it remains relatively unharmed *in direct proportion to its yielding capacity, its strength and its coherence.*

"Earthquake forces and their induced stresses stand in the relation of what may be termed in mechanics 'active and passive forces.' If the forces which balance each other upon a given body are distinguished into two systems, active and passive, standing to each other in the relation of cause and effect, then in nature we observe that the passive forces are the least in quantity capable of balancing the active forces consistent with the physical conditions of the body or structure. In short, the effect of an earthquake in rupturing a structure depends upon the strength, rigidity and size of the structure. The amount of earthquake stress called into play is directly proportional to the resistance offered. Other things being equal, the more yielding a frame, the less its resistance, and the smaller the destructive earthquake stress induced.

"If two structures are founded across a 'fault line' or on moving ground, and one structure is twice as strong as the other, the earthquake will have to do twice as much

Top, left—The central section of Santa Rosa, California, every building in which was constructed with a view to withstanding earth shocks. This city was all but destroyed in the quake of 1906, and specific plans were adhered to in its rebuilding, so that the new structures would not be toppled over by any seismic disturbance. Directly above—Tamalpais, the walking mountain, which through the seismic force of strain creep is moving northward at about three feet each year. Right—The campanile of the University of California. This bell tower is believed to be the most nearly quake-proof structure in the world, and was erected with that end in view. Circle—Petrified trees in Northern California which have been broken in two by unrecorded earthquakes in past centuries, long before white men came to California.

work, or exert twice as much force, to rupture the latter as to wreck the former. The earth moving in waves is responding to a force that, as far as human effort is concerned, is irresistible. Structures on the surface, however, if flexible and light, will move with the ground, and suffer no damage, like waving cornstalks. Those of an opposite character will not move without damage. Here is a practical exposition of the fable of the willow and the oak tree. A heavy mass, such as a brick building, by its very nature must resist the wave. Its motions and rigidity are a measure of its immediate resistance, and also a measure of the damage done. The greater the resistance, the greater the damage, as the earthquake force is or may be without limit.

"Designers agree, therefore, that, other things being equal, the selection of the site is important, but neither architect nor engineer is always free to select the site. Cities must be built along lines of trade; a waterworks dam must be built in a gulch, even though an active fault line pass through it. On rocky and high land in San Francisco, much less damage was done in the earthquake of 1906 than on the low and filled-in lands. The designer and the builder, as well as the owner and the public, then must take some chance, either because a site is fixed, or because the possible expenditure of money is limited. This, however, is not an argument favoring cheap, unintelligent and criminal construction.

"Brick and block work construction, of all types of building, are the least adapted to insure the requisite yielding capacity for the structure as a whole. On solid elastic ground, I would rate, in the order of their value in resisting seismic forces, buildings in the following order: 1. Structural steel cage construction; 2. Wood frame; 3. Reinforced concrete; 4. Brick and block work. Foundations should reach to firm ground, or structures should be built on solidly braced pile platforms. Where the surface is movable and shifting, the structure should be made to stand free, as with a moat around it. Coupling together of parts which have different periods of vibration should be avoided. Where this is impossible, the parts with different vibrational periods should be linked together so securely that they will tend to move as one whole. Brick structures divided into compartments with walls at right angles, vibrating out of time in their several parts, batter themselves to destruction, and perhaps the greatest danger in earthquake countries comes from brick dwellings with improperly designed roofs in which the inclined rafters have no tension ties. In earthquake vibration, the roof peak drops and the rafters thrust out the walls. Cornices of brick, terra cotta and stone should be avoided, since such masses will be thrown to the ground in a violent quake, even though well anchored.

"Reinforced concrete has its component materials of concrete and steel placed to withstand compression and tension stress due to vertical loads. In a violent earthquake, the forces applied to a building may be vertical, horizontal or torsional. I would expect, therefore, that high reinforced concrete buildings as now built would exhibit more damage in a great earthquake than would a comparable steel-frame structure. Like brick and block-work buildings, masonry arches of stonework are hopelessly inadequate to withstand earthquake shocks. Under the action of horizontal forces, the arch ring opens, the keystone drops, and the entire structure collapses. If arches must be built, they should be reinforced, or their stones supported and tied with steel girders, or preferably, the arch ring itself should contain a skeleton of structural steel capable of taking a variety of stresses.

"Calculations cannot be made for structures to withstand the major effects of earthquakes such as occur along a fault line or on shifting deposits. It is possible, however, to design structures to withstand stresses due to vibration where the structure rests on a solid and an elastic foundation, and where there is no differential movement of the parts. Since 1906 it has been the custom of engineers to design important works so founded on solid ground by assuming the structures subject to lateral forces acting similarly to wind pressure. These horizontal forces are figured for an earthquake acceleration of six feet per second. These are the direct application of mechanical principles of design to the action of vibratory forces. The campanile at the University of California was designed to withstand such stresses, which were very large and difficult to handle because of the heavy dead weight of this monumental bell tower. Wherever possible, designs should limit the weight, but not the strength or coherence or the anchorage of parts, for *earthquake stresses are in direct proportion to the dead weight of the structure.*

"The structure which is to resist the earthquake, then, must be erected on a suitable site, not along or across a fault line; suitable type of design must be chosen, above all with firm anchorage and avoidance of discordant vibratory rate in parts; and an adequate foundation provided."

After a considerable study of the results to buildings of the San Francisco earthquake of 1906, a committee of the American Society of Civil Engineers reached the conclusion that "sufficient evidence is at hand to warrant the statement that a building designed with a proper system of bracing to withstand wind at a pressure of thirty pounds a square foot will resist safely the stresses caused by a shock of an intensity equal to that of the 1906 earthquake. The prime requisite of such a structure is elasticity, and it may be questioned where difference in workmanship was not responsible for many of the destructive results of the San Francisco earthquake. While it is true that good workmanship gave better results than ordinary, yet it is the opinion of the committee that it was mainly a question of design."

One of the most important problems arising in the preparation of cities, as well as buildings within those cities, to resist earthquake shocks comes in regard to the maintenance of water supply. By far the greater part of the destruction wrought by an earthquake is done by the flames which almost inevitably follow the action of the seismic forces. This was true in San Francisco and in Tokyo and Yokohama. San Francisco has answered this problem by establishing, in high and hard ground, a system of salt-water reservoirs, exclusively for the use of the fire department and entirely independent of the fresh-water supply for the regular uses of the inhabitants of the city.

In general, it is the consensus of opinion of waterworks engineers that three precautions can be taken which will insure to a city a supply of water adequate to its domestic needs during and after an earthquake shock of high intensity. These are: First, location of waterworks structures, including dams, reservoirs, main pipe lines and pumping stations, away from known soft, filled and fault areas which are subject to excessive movement; second, isolation of selected sections of the system within the city by gate valves, placed at all points where pipes cross the boundaries of ground subject to such excessive movement, which valves can be shut off, with the exception of one or two which pass the ordinary supply to the limited district; and, third, the carrying in storage, within the city, of a large quantity of water available for distribution, so that breaks in the main conduits carrying the supply of water from the mountain or river sources will be of relatively less importance than breaks in the distributing system within the city itself.

Man Games and Man Friends of Twenty Years

Concluded from page 6

over. I undertook the really severe task of straightening up. The muscles of the back and neck were loosed and let down; every organ of the torso had lost its proper center of gravity—as it does from high heels—and rebelled against going back.

Formerly in moments of physical depression I used to ponder on taking a few weeks off, some time, to get my health back. It can't be done in a few weeks—the wrecker comes to work in the body before the builder. In undertaking to make yourself right, you first uncover what is wrong. You become sick in many spots, one after another.

I expected results immediately, but found I had to forget to expect results, before they really slipped in. Each correction of a fault shows up others.

You accept the bigness of the task, finally. One must not neglect his work, if for no other reason than that if he does, he loses the joy of play. The pursuit of health for its own sake may turn one into an uncongenial crank; making a labor of the pursuit of health, has also a way of making a man hard to live with. But work and play, as part of one thing, is a true and unfailing means to regain that zest which steals away so softly, through the years of tumult, and without which one has nothing, with all his Career.

Five years; no important tennis yet, in my case, but that is neither here nor there. I do have an hour or two of enjoyment on the courts nearly every day; also, I have health of a better quality than I used to think possible for any man, but the more *light* one gets on this or any subject, the vaster appears the field.

One day recently I opened an envelope to find a check for several hundred dollars, and a bill against me for two dollars and forty-five cents. It was from Gnat. He had given two or three days of his time in saving my equity in a real estate transaction in the vicinity of Detroit, a lot which I had all but counted lost. The bill was for carfare, he said. All in all it was one of the most interesting checks I have ever received, and doubtless it had something to do with my call at Detroit soon afterward. The five of us foregathered for luncheon, I think at one of the same tables at which we often used to sit. Eddie had his old plate of onion soup.

He has come on. His verses are in books now, and all over the country in newspapers every day. I have heard him spoken of as "America's favorite poet," and he probably is. Occasionally he hits the bull's-eye with a fine idea, and people repeat his rhythmic rendering of it and it cleans them up. He still talks after dinner, but he's a youth yet, with an afternoon of golf every chance he gets. Walter is out in the big waters of trade. Gnat is at the head of the trade paper, which is now authoritative and established.

Money wasn't mentioned at that luncheon, but I have reason to believe that three of the fellows are rich men today. All were in Detroit through its great and spectacular material rise. Perhaps Art isn't rich, but he is an artist, which has its compensations. He sells a painting here and there and drives a car, at least. We went upstairs and had some kelly-pool at the same old table.

I looked the four over with joy. Each in his own way had turned the trick. They had kept up the play of boys, while they were learning to work as men. More than that, they had kept up their affection for each other, and I was proud to have a part, even on the rim. Of course, one of the most subtly rejuvenating elements of all games, in and out, is warm-hearted association with the "fellows."

. . . . Banging the balls around, I found I couldn't keep up with my end in the humor any better than in the old days, nor was my kelly-pool even respectable, but I had a rapt hour. For I realized that we were all reaching a time when the puzzle of life must soon unfold—when we would begin to see what a Great Game it all is—see it a little from above, not from the smoky ruck of the contest.

BRIEFLY TOLD

"The President, commander-in-chief of the Army and Navy, desires and enjoins the orderly observance of the Sabbath by the officers and men in the military and naval service. The importance for man and beast of the prescribed weekly rest, the sacred rights of Christian soldiers and sailors, a becoming deference to the best sentiment of a Christian people, and a due regard for the Divine will, demand that Sunday labor in the Army and Navy be reduced to the measure of strict necessity."—*Abraham Lincoln.*

Rum runners along the Jersey coast will be chased by speed boats driven by twin airplane motors capable of forty miles an hour. These boats can race to the twelve-mile limit and back in forty minutes. They have no masts, cabins or side lights, and travel like hydroplanes.

Gas generated by the submerged grain cargo of the steamer *Hivos,* sunk by a German submarine in 1916 on the coast of Algeria, raised the vessel to the surface. When the water pressure was removed the vessel promptly blew up.

The famous Liberty Bell in Independence Hall, Philadelphia, will be placed on continuous exhibition behind an ironwork grill.

Ten cities of the United States have $80,000,000 deposited in Postal Savings accounts.

Bamboo is being successfully grown in Georgia.

The annual sales of talcum powder, cold cream, rouge, lip-sticks, and toilet powder amount to $750,000,000, or about fifteen dollars for every woman in America.

Statistics prove that deaths of babies under one year are as numerous as deaths of persons seventy-five years old.

"Parliament is there. It exists. I use it whenever necessary. It is very quiet, behaves itself, and doesn't create much disturbance."—*Benito Mussolini,* Italian dictator.

"Common sense, in a rough, dogged way, is technically sounder than the special schools of philosophy, each of which squints and overlooks half the fact and half the difficulties in its eagerness to find in some detail the key to the whole." —*George Santayana.*

A pear tree brought from England by Governor John Endicott, of the Massachusetts Bay Colony, in 1630, is still bearing fruit on the spot it was planted at Danversport, Massachusetts.

A topaz ten by seventeen inches, weighing about 100 pounds, has been sent to the Field Museum of Chicago by a gem-hunter in Brazil.

Under Fascismo the people of Italy are becoming more thrifty. For the present fiscal year the increase was $168,000,000 over the corresponding figure of last year.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Thomas Gray labored seven years upon his "Elegy."

"A person who cannot succeed without being in a herd ought to organize his own herd. My advice to a young man is to learn to pitch in and fight his battles single-handed. Sheep and goats run in droves, but lions and tigers do not."—*E. W. Howe.*

A proviso in the will of the late Lord Morley reads as follows: "As it is possible that some person may desire to write a memoir of my life, which I regard as wholly superfluous, I enjoin upon my executors to refuse to aid or encourage such design and not to allow any such person to have access to any of my papers, whether personal or acquired in the course of official duties." Lord Morley himself was the leading biographer of the past century, having written lives of Cobden, Gladstone, Burke and Cromwell.

What is believed to be the smallest church in the world is a little stone chapel dedicated to St. Anthony situated five miles east of Fort Atkinson, Iowa. The outside measurements are twelve by twenty feet. The chapel seats a congregation of eight.

Giacomo Puccini, composer of "Madame Butterfly," has recovered damages in Italy because "One Fine Day" was taken from the opera and jazzed, according to reports.

The defeat of all measures making possible the use of the Bible in the public schools was recommended in a report read at the tenth triennial convention of the National Council of Jewish Women, at St. Louis, Missouri.

There are about 1,750,000,000 persons in the world. The total doubled in the last century.

In the Hall of Representatives, in Boston, hangs a wooden codfish, "The Sacred Cod," it is called, "as a memorial of the importance of the Cod Fishery to the welfare of this Commonwealth," in accordance with a resolution passed in 1784.

A female lobster will lay from 3,000 to 75,000 eggs, according to its size and age. The eggs are glued to the under surface of the body and are carried about for ten months before hatching.

During the reign of Edward I, the Welsh rose against the English declaring that they would never acknowledge allegiance to any prince "but of their own nation and language and of unblamable life." Edward II was born in a castle at Carnarvon, Wales, and he was presented to the Welsh people as "a native-born prince of unblamable life who could speak no word of English." From that date the recognized heir to the English throne has borne the title of Prince of Wales.

Effigies carved 20,000 years ago and found in caves in France would indicate that the negroid type was prevalent in France at an early date.

The Museum of the City of New York has an old-time tavern sign on which is printed the following: "Four pence a night for Bed. Six pence with Supper. No more than five to sleep in one bed. No Boots to be worn in bed. Organ Grinders to sleep in the Wash house. No dogs allowed upstairs. No Beer allowed in the Kitchen. No Razor Grinders or Tinkers taken in."

The birthplace of J. Fenimore Cooper is to be saved by the Burlington, New Jersey, Historical Society. A portion of his library, his writing desk, his chair, the bellows that stood by the fireplace and other mementos of the days that Cooper has made so memorable have been preserved. Next door is the birthplace of Captain James Lawrence, who said, "Don't Give Up the Ship," when the *Chesapeake* battled the British frigate *Shannon* off the shore of Boston during the war of 1812.

The Thanksgiving statement in President Coolidge's own handwriting that was broadcast throughout the country by a newspaper syndicate was obtained by a persevering young girl reporter. White House officials, solicitous newspapermen and secretaries told her it was impossible. President Coolidge heard her wish and declined. For the fourth time she broached her idea of a signed Thanksgiving statement personally and it was given out.

FIVE YEARS OLD—600,000 CIRCULATION

In the short space of five years, THE DEARBORN INDEPENDENT has become the world's foremost non-fiction, fact-giving weekly. It is being read in hundreds of thousands of American homes every week and is doing its part toward developing those standards of living and government which will insure continued welfare and prosperity for our country.

Any Ford dealer will gladly accept subscriptions or they may be mailed direct, using the accompanying subscription blank.

Girard Estate Surplus a Burden?

Theft of the Kaiser's Ash Tray

CHRONICLER OF THE NEGLECTED TRUTH

Girard Estate Surplus, From Coal, Held Burden

Public Pays Heavily to Pile Up Millions Taken From Anthracite Royalties

By WILLIAM A. M'GARRY

NEARLY one hundred years ago a man died in Philadelphia after amassing a fortune estimated at $25,000,000—at that time probably the largest in the United States. He had been a poor boy, and in spite of his wealth in later years his life had been an unhappy one. Perhaps because of that he became obsessed with the idea of devoting his fortune to the poor. Accordingly he founded in his will a college for orphan boys, making such wise provisions for its growth and expansion to meet the changing needs of the times that it is still recognized as a model educational institution in many respects. He left the bulk of his estate to this school, providing, however, that after all its needs had been met, the income of the estate should be devoted to the people of his adopted city. Here is the exact clause covering that usage:

"To enable the said corporation (of Philadelphia) to improve the city property, and the general appearance of the city itself; and in effect to diminish the burden of taxation, now most oppressive especially on those who are least able to bear it."

The name of this man was Stephen Girard. At the time of his death, in 1831, not even the executors realized the immense value of his estate. One of the largest items in it consisted of large land holdings in Schuylkill and Columbia counties, Pennsylvania. It was not until more than twenty years later that the hard coal rush started, and every year since then *the value of Girard's land holdings and the income from coal mining therein has increased.* Seventeen years after Girard's death—in 1848, to be exact—Girard College was opened, and at that time the residuary fund of his estate was estimated to be worth about three million dollars. On December 31, 1922, the value of that estate was officially announced as $55,485,684.31, which was $3,198,970.47 more than at the end of the year 1921.

Surplus Held a Burden

THESE figures and certain others to be quoted are of interest to every consumer of anthracite coal and to every citizen anxious to grasp the point of view of the banking world. The short quotation above from the will of Stephen Girard is sufficient to show that he had in mind a pure philanthropy, which is confirmed by a reading of the entire document. Insofar as the college is concerned the achievements are even greater than the broad vision of the founder. But when the residuary fund of more than fifty-five million dollars is considered in the light of the whole will, the question arises whether Girard's philanthropy has not been turned into a public burden.

To understand how that has been accomplished, let us summarize the growth of this residuary fund. On January 1, 1923, former Governor Edwin S. Stuart, of Pennsylvania, for many years president of the board of directors of city trusts, which administers the Girard Estate, made an address at the seventy-fifth anniversary celebration of Girard College. He said, among other things:

"In 1873, at the end of the first twenty-five years, the residuary fund was $4,962,735.22, while the number of pupils had increased to 546 and the annual cost of maintenance to $188,000.

"In 1898, when the college had been opened fifty years, the residuary fund had increased to $11,700,000, the number of pupils to 1,536 and the annual cost of maintenance to $480,000.

"Today, after an existence of seventy-five years, the residuary fund is $51,000,000, the number of pupils 1,545 and the annual expenditure for maintenance $1,300,000. In addition to the $51,000,000, which is all income-producing, there is carried on the books as the nominal value of the college grounds and buildings—$4,500,000, making the total capital $55,000,000."

It will be noted that the constantly increasing growth and ratio of growth in the residuary estate is exactly parallel to the growth of the anthracite industry. It could not be otherwise, for the Girard Estate has been for sixty years one of the largest holders of hard coal lands. Under the royalty provisions made by the board of city trusts the returns to the Girard Estate are based not on a fixed, unchanging value, *but on the price that the operators of the mines are able to obtain for the coal.* In the early years of anthracite mining the normal royalty, paid by operators to owners of coal in the ground, was five cents a ton. It rose to ten cents, to fifteen and to twenty-five cents, but it was always a fixed figure for the life of the coal mine lease. Fifty cents a ton is considered in the industry today as a reasonable rate. *Yet the Girard Estate—a philanthropy, not compelled to make profits for stockholders—is getting in some instances as high as $1.50 a ton.*

The doctrine of anthracite coal operators has always been "All that the traffic will bear," which they justify by asserting that they must look after the rights of their stockholders—even when returns have repaid the initial investments many times over. But no such argument is possible in the case of the Girard Estate and the board of city trusts. In 1918, when the Senate Committee of Manufactures investigated the rising price of anthracite, I. Hazelton Mirkil, general manager for the board of directors of city trusts, wrote a letter containing the following:

"The owner of the coal lands in question is not a mercantile or business corporation of any kind, but is a governmental institution, namely, the city of Philadelphia, which holds them in trust for public charitable uses . . . . The government of this state has placed this charitable feature of the municipal government in charge of a board of twelve, called directors of city trusts, selected by the judges, to whom are added, ex officio, the mayor and presidents of city councils."

The Girard Estate, in attempting to justify high royalties and the sliding scale principle, has argued that the institution is not a controlling factor in the industry, since it produces only about four per cent of all the hard coal sold. Men identified with the coal industry, however, are of the opinion that the board of city trusts of Philadelphia has been primarily responsible for the increase in royalties. Its system of a sliding scale, based on all the operators could get from the ultimate consumer, has been adopted by other coal land owners as justification for increasing royalties far beyond figures that were held to be fair even a dozen years ago. The whole trend in the industry has been away from the flat rate in favor of the sliding scale made popular by the Girard Estate.

The output of the estate in hard coal may not be sufficiently large to control the entire industry, but the profits obtained from that four per cent output offer a remarkable illustration of the anthracite burden borne by the consumer. Bearing in mind that the profits of the Girard Estate are limited to royalties—to the price paid by an operator for coal in the ground; and that the mines did not operate for five months in 1922 owing to the strike, the important fact remains that the receipts from the property of the Girard Estate outside the city in 1922 were $2,032,292.51, and in 1921 they were $3,521,420.21. These figures are given in the last annual report of the board of city trusts. In the same report appears the following:

"The shipment of coal from the Girard Estate in 1922 was very materially reduced by the miners' strike, lasting from April 1 to September 11, and amounted to only 2,050,257 tons, as compared with 2,983,723 tons in 1921. The Girard Estate's proportion of the total shipment of anthracite coal from Pennsylvania during 1922 was five per cent, which was the highest it has been since 1880."

There are now sixteen leases in force, the bulk of them held by railroad operators such as the Philadelphia and Reading Coal and Iron Company; the Lehigh Valley Coal Company; Madeira, Hill and Company, and their subsidiaries.

The directors of the board of city trusts apparently expect to perpetuate the system on which they are now operating. Read the following additional extracts from the speech of Governor Stuart, president of the board, at the anniversary celebration last January:

"The total expenditures for maintenance (of the college) from 1848 to 1922 inclusive, were approximately $29,000,000, while the amount spent for improvements during the same period, not including the $2,000,000 left by Mr. Girard for the construction of the college, but including the total cost of buildings already constructed and those now under contract and in course of construction, to pay for which funds have been appropriated and set aside, was approximately $5,000,000.

"This is a wonderful showing. But wonderful as it is, it will be surpassed in the future. I am going to make a prediction that twenty-five years hence, on the first day of January, 1948, when the one hundredth anniversary of the inauguration of this college will be celebrated, if nothing unforeseen happens, and in the meantime the estate has been managed in a wise, conservative and businesslike manner, and the present financial policy as adopted by the board of directors of city trusts in 1897 is not changed, but strictly adhered to, the residuary fund providing income for the maintenance and improvement of Girard College first, the primary object of the testator, and for the secondary trust, as directed in his will, to wit: 'to enable the corporation of the city of Philadelphia to maintain a competent police force, to improve the city property and in effect to diminish the burden of taxation,' will be at least one hundred millions of dollars."

Guided by Will, Board Claims

THUS it would appear that the board of city trusts intends to keep right on collecting royalties at a rate that has been denounced by even the anthracite industry as exorbitant, until it shall have gathered from the consumers of hard coal a fund of a hundred million dollars. It is stated repeatedly that the board is guided in its actions by the will of Stephen Girard. But anthracite mining was virtually unknown at the time he was still alive, and there is not a word anywhere in his will calling for a sliding scale of royalties. The primary purpose of his will has been met; Girard College has been expanded to a point probably far beyond his dreams, and the income of the estate as shown by figures above is more than three million dollars a year above the requirements of the college.

Although it is true, and requires specific acknowledgment, that no higher use could be found even for exorbitant coal profits than in fulfilling the philanthropic desires of Stephen Girard, it is also true that since these profits are collected from the people at large, they are entitled to evince a definite interest in the purposes to which those profits are to be devoted in the future. The quotation given in the second paragraph of this article, and partially repeated in the report of Governor Stuart's speech, tells only part of the ultimate purpose. Girard went into a great deal of additional detail as to the expenditure of the extra earnings in the residuary estate. He also provided a special fund of a half-million dollars at his death, devoted to the improvement of a certain section of the city. This was from the personal estate and does not gain anything from the sale of hard coal.

In his will Girard provided that this special bequest of $500,000 be kept invested forever to improve the river front section of old Philadelphia. He went into detail as to the improvements he had in mind, such as the laying out and paving of Delaware avenue, the removal of fences and other obstructions along the wharves, the destruction of all wooden buildings within the limits of Philadelphia, the widening and paving of Water street. All these requirements have been fulfilled. To make sure that certain laws required to carry out the provisions of his will would be enacted, Girard further provided $300,000 to the Commonwealth of Pennsylvania "for the purpose of internal improvement by canal navigation," providing that this sum "be paid into the state treasury by my executors, as soon as such laws shall have been enacted by the constituted authorities of the said commonwealth as shall be necessary and amply sufficient to carry into effect the several improvements above specified."

Alumni Enter Protest

BOTH of these amounts came from the personal estate, and the half-million-dollar fund still working in Philadelphia is not dependent on royalties. The uses to which its earnings are put, however, have been taken as an indication of what will be done eventually by the board of city trusts in disposing of the earnings from the residuary estate, when hard coal profits make it large enough. This half-million-dollar fund, of course, is also administered by the board of city trusts. Turning to page nine of the report of that board for 1922, the following is found:

"The fund for the improvements of the eastern front of the city amounts to $587,469.97. The expense of lighting, of patrolling, and of minor items incident to the care of the district lying between Vine and South streets, Front street and the Delaware River, has been paid out of the income of this fund, and amounted in 1922 to $9,225.29."

In the twenty-second clause of his will—after he had made full provision for the care and expansion of Girard College—the donor of this fund and of the fund that has now grown to fifty-five million dollars made this provision for the eventual use of its earnings:

"To enable the corporation of the city of Philadelphia to provide more effectually than they now do for the security of the persons and property of the inhabitants of the said city, by competent police, including a sufficient number of watchmen really suited to the purpose; and to this end, I recommend a division of the city into watch districts of four parts, each under a proper head, and that at least two watchmen shall in each round or station patrol together.

"To enable the said corporation to improve the city property, and the general appearance of the city itself; and, in effect, to diminish the burden of taxation, now most oppressive especially on those who are least able to bear it."

From the foregoing it will appear that there is virtually no public purpose to which the earnings of this fund may not be put within the limits of Philadelphia. It has been shown that all the requirements of Girard College have been met. The estate now has more than $28,000,000 invested in mortgages, stocks and bonds, and the receipts from this investment alone would be sufficient to care for the college for all time. In addition, however, the estate has vast property holdings in Philadelphia, including many office buildings.

It is interesting, in view of the announced policy of the board of city trusts that it intends to continue its present scale of royalties, to see what the graduates of Girard College think about that program. A few months ago a great deal of excitement was stirred up in the board by the receipt of a letter from the Girard Alumni of the Lehigh Valley. Apparently the answer did not satisfy the graduates, for a little later there came into circulation the following set of resolutions, adopted at a special meeting of the Alumni Association in the anthracite regions.

"To the Board of City Trusts and the Girard Estate:

"Gentlemen: We, the members of the Girard Alumni of the Lehigh Valley, realize at this time the critical situation the country is put to by the lack of anthracite coal, which is caused by the continual disputes, both of the coal operators and miners, and which has continually caused strikes. We do not know what the final outcome will be if these disputes continue, as it breeds socialism, bolshevism and government ownership.

"We feel that our foster father, Girard, who so nobly stood by his countrymen during all the crises of war and disease, would also settle this dispute, as his estate owns the greater part of the valuable coal deposits of the anthracite region of Pennsylvania; and as Sons of Girard we do hereby petition the Board of City Trusts to uphold the noble place and purposes of Stephen Girard, as we full well know that he would not work the mines with a selfish purpose in view, as his life was full of love and sacrifice and we hereby petition the Board of City Trusts so to organize the Girard Estate as to mine the coal instead of getting royalties; and themselves disposing of the coal at a fair profit to the estate, a fair wage to the workmen and a fair price to the consumers, on the same principle that the Girard Estate has been handling the homes which they have built in South Philadelphia.

"This may not be an easy task, but we know that your board is composed of the finest type of men in the state, from the standpoint of character, religion and business judgment, and were the mines worked on the same principles as you manage Girard College you undoubtedly would have in the miners and coal consumers as dear friends as you have in all Girard boys. We full well know and realize that all the members of the board are our best friends as an organization and individually."

Left—German women can and do work. Most of them had to do a man's job during the war. Right—Wooded areas about the big cities are kept scrupulously clean. English coal is too expensive to buy.

Five Years of Republican Germany

German People, Fighting for Existence, No Longer Sure Whether Republic Is Meant for Them

Tabby's soft fur, the old doorknob and the bones Rover used to get, can be disposed of here for cash. Shops like these are a boon to the hard-pressed housewife.

By WALTER M. WOLFF

"JA, JA, DER DOLLAR!" sighed little Frau Schultze as she came home from the market with her half-filled basket and dropped wearily into the first chair available. "I would have bought more," she continued, "aber der Dollar ist schon wieder gestiegen!" (but the dollar has again gone up!)

Herr Schultze looks up askance from his breakfast and shakes his head. Molly Schultze, who had been busily flitting about the kitchen, pauses for a moment in deep thought, while Johann, her brother, thumps the table with his fist and vehemently says a few hard things about the times. "Always the old story! How much longer will it last? Immer der Dollar, der Dollar!" he remarks, despairingly. And his pet, Felix, the parrot, loyally supports his master's statements by screeching out at the top of his voice, "Verdammter Dollar!! Verdammter Dollar!! Verdammter Dollar!!"

Multiply the above scene (minus the parrot) several million times and you will get a slight notion of the main subject of daily conversation among the German people. For the last five years the German mark has fallen in value with almost measured regularity until today the people no longer throw up their hands in dismay as they did at first, but they are wondering when the sinking is going to stop. When marks were quoted around 700-800 to the dollar less than a year ago, everybody predicted with an air of extreme confidence that "the dollar might touch 1,000, but it can't go any higher." They said the same thing when marks were rated at 45-60 two years ago, namely, that 100 marks to the dollar might be possible but it would mean ruin to the country and financial chaos throughout Europe.

Today Germany has not improved her finances nor her standing among the major nations, but there is far less excitement manifested when the mark drops to some new point below zero. And why is this? Because the Germans have grown used to "big figures" and now believe anything to be yet possible as long as present conditions continue. And they are right, for nearly anything foolish is possible in the present Social-Democratic "Utopia" of Germany. But "when the dollar goes up," as the Teutons love to term it, prices immediately follow and Old Man Wages comes sauntering along far in the rear, usually too late to enable the Germans to take advantage of the old prices. It's like the old yarn about the dog chasing its tail, and the German is sore at his government, sore at the dollar, and sore at everything in general.

A great many people in the world have a notion that Germany with a population of some sixty millions today is a mighty nation with vast resources and extensive domains. As a matter of fact, Germany, before the pie was cut, used to have an area about as large as Texas, with a host of great world cities. We can imagine what Texas would look like if we should suddenly transfer such cities within her confines as Chicago, Philadelphia, Boston, St. Louis, Kansas City, San Francisco, Los Angeles, and a dozen others of our largest cities. Old Texas would unquestionably be pretty well packed to the edges, but this is exactly how Germany would appear if transferred to our own topography. Within an area not as large as one of our states Germany has a score or more cities with a population ranging from 300,000 to more than four million.

The Fatherland today is much like a playhouse in which all seats including standing room have been sold out. Poincaré's statement that there were twenty millions too many humans in Germany is a conservative estimate. For health's sake something must very soon be done in the larger cities. Congestion has become almost intolerable and the effects of excessive overcrowding will be visited upon the next generation with no small degree of severity. Take, for example, Berlin. Recently published statistics show a serious retrogression in health in many parts of Germany and particularly in Berlin. In Berlin approximately four million souls are living in an area of about 356 square miles. Many of the living quarters available are quite inadequate to the needs of their occupants. It is estimated that *seventy per cent* of the total number consists of but *two rooms and a kitchen*, while scarcely ten per cent have more than four living rooms. Furthermore, as there are not enough dwellings for everybody, many families have been obliged to live during the winter months in huts and temporary shelters. Even the better houses are fast falling into disrepair due to the proprietors' lack of funds.

As prices have soared, it has become impossible for many persons to get essential foodstuffs. Much of that offered is of inferior quality, lacking fat, legumes and sugar. This is particularly true in the case of milk. Potatoes are being eaten in increasing quantities but a decrease in the use of high-grade foodstuffs such as meat, eggs, white bread and milk is apparent, as they can be had in insufficient quantities only and at very high prices. As an inevitable result, a certain malnutrition is observable among a large part of the population, bringing liability to disease and a decrease in the working strength of the individual.

Public hygiene is also suffering severely from the present conditions. Prices for baths in bathing establishments have been advanced until today they are beyond the reach of many former patrons. During the winter months many bathing places are closed on account of the high price and scarcity of coal. As many people consider hygiene a sort of luxury, economizing begins at baths with the result that skin diseases are increasing. High coal prices make it impossible for many householders to heat their rooms properly, thus increasing the number of colds and illness in general. In a city the size of Berlin almost anything serious may be expected. Maladies, showing during the war, as for example, scurvy, are appearing again and instances of starvation are manifold, especially among the hard-pressed professional classes and the "Mittelstand." The number of suicides has also mounted to alarming proportions during recent months.

Germany is literally withered out—disgusted with itself and the rest of creation. When an entire nation, with the usual handful of exceptions, is overworked, overtaxed, underpaid and undernourished, it is likely to develop the "don't-give-a-damn" spirit eventually. But a great part of the German people are directly to blame for what is transpiring. There are far too many idealists—not enough God-fearing producers. The latter class has developed a sense of apathy which is not an asset. Too many Germans have been attracted to the "Eleventh Commandment" (Thou must not let thyself be caught!). Since there is little law and order under the present régime, even in the unoccupied parts of Germany, dishonesty and crime seem to be paramount.

During the last years of the war, the Teutons learned the art of stealing and many seemed to pride themselves on who could steal the most and get away with it. It was and is to this very day no uncommon sight to see entire railway coaches stripped of their brass fixtures, leather window straps, curtains and plush seats, and to see upon the streets individuals wearing new dresses, hats, or entire suits made of the stolen cloths. For sheer "crust" the Germans carry off the Grand Prix. One almost has to be dishonest, wary and lawless to exist in the Fatherland nowadays. And no small share of this accusation falls to the radical elements of the country, found most prominently in the ranks of the Communistic and Social-Democratic parties.

As long as the German people cannot stand united behind the republic, the republic is not meant for them. In my estimation, it never was meant for them but came to be the abortive thing that it is out of the terrible revolution of 1918, a devastating reaction to the scourge of war and defeat. But by rushing into an embryonic stage of republicanism, the Germans jumped from the faggots into the fire. Had they known that the republic should turn out to be an oligarchy of incompetent Socialists and radical Reds, they would never have erased all traces which smacked of the old régime. Do not mistake me when I say that the Germans do *not* want the kaiser back in Berlin. They do not. But what they want *and what they woefully need* is someone and some government that is purely democratic and not afraid to assert the true ideals of liberty for which the German people have always yearned. The Germans want someone who can enforce law and order, and they want to have a direct choice in choosing that someone.

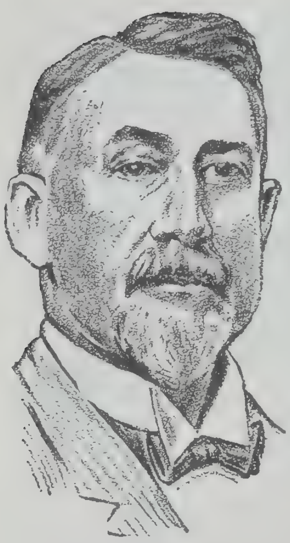
The intense strain and hardship under which the German is laboring today—the terrific internal pressure and outside oppression—is rapidly wearing him down. A nation starved physically, mentally and morally soon reaches the point where it cares little what ultimately becomes of it. In just such a predicament Germany finds herself today. And for this reason it is not hard to understand why the aims and designs of one M. Poincaré are slowly but surely wearing away the foundation of the German Republic. In no remote future the dismemberment of Germany will be an actuality and the German people will find themselves securely bound hand and foot as vassals to French masters. A crisis in Germany is imminent. Like the smouldering fire within a volcano, the events transpiring within Germany during the past few weeks give every indication of not-far-distant eruption. German patience and endurance with fate is worthy of genuine admiration, but to hold out indefinitely after suffering and enduring all for nine years is a human impossibility.

If every German were as good and loyal a German as practically every Frenchman is a good and loyal Frenchman, or Englishman an Englishman, or American an American, instead of fostering the "Party-first-and-Devil-take-the-country" spirit, Germany would hold a much more formidable position today, with her people and her works universally honored and respected.

You can find plenty of both in Germany today—the hovel and the mansion Both are the direct result of the steady, unprecedented fall of the mark.

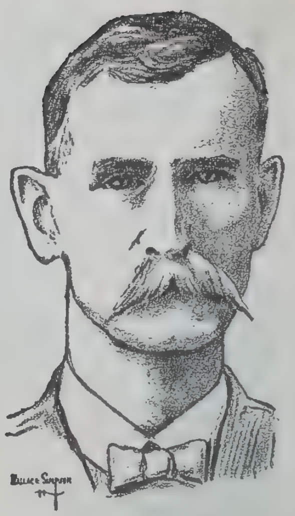
The Gospel West of the Pecos: Memories of Other Days

Brother Bloys, Little Minister of the Hills, Who Came to Texas in Buckboard, Was Slight in Body, But Mighty in Mind



R. L. IRVING,

Who succeeded Brother Bloys as General Manager of the Cowboy Camp Meeting.



DR. W. B. BLOYS,

"Slight of body, mighty in deed!"

By MAX BENTLEY

LIFE SKETCHES BY WALLACE SIMPSON

THIRTY-SIX years ago a slender little man with blue-gray eyes drove across the Pecos River in a buckboard to organize a Presbyterian congregation in the mountain village of Fort Davis, Texas. That was a time when the western frontier was earning its reputation for wildness and wooliness, and that part of Texas belonged to the frontier.

The newcomer lost no time delivering the message of his Master. He delivered it so earnestly, so eloquently, and so proudly, that the cowmen came to hold him in love and veneration such as no other man has enjoyed that ever lived out there. They came to call him everybody's friend, little minister of the hills, and, finally, just plain Brother Bloys.

Slight in body, mighty in deed! William B. Bloys, man of God, went to his rest six and one-half years ago (died at Fort Davis, March 22, 1917), but the memory of him lives. It lives wherever there is a habitation in the mountainous interior of Western Texas. It poignantly lives in a certain mile-high bit of mountain and sky and meadow hidden twenty miles from a railroad, in the heart of the Davis Range, and known as Skillman Grove. The outward manifestation of it is the monument erected to him by the Bloys Camp Meeting Association, in 1918. It is a slender, four-faceted shaft of blue-gray granite—the color of his eyes. They placed it near to the meeting-house which he had built with his own hands. The inscription reads: "In memory of our beloved brother, Dr. W. B. Bloys, founder and for twenty-seven years the faithful leader of this camp meeting."

There are several ways to climb to fame. One is to do unusual things in a spectacular manner. Brother Bloys never worked that way, but Roy Bean did. Those two names—Bloys and Bean—stand out over all others in the annals of the ranch country of Texas, west of the Pecos.

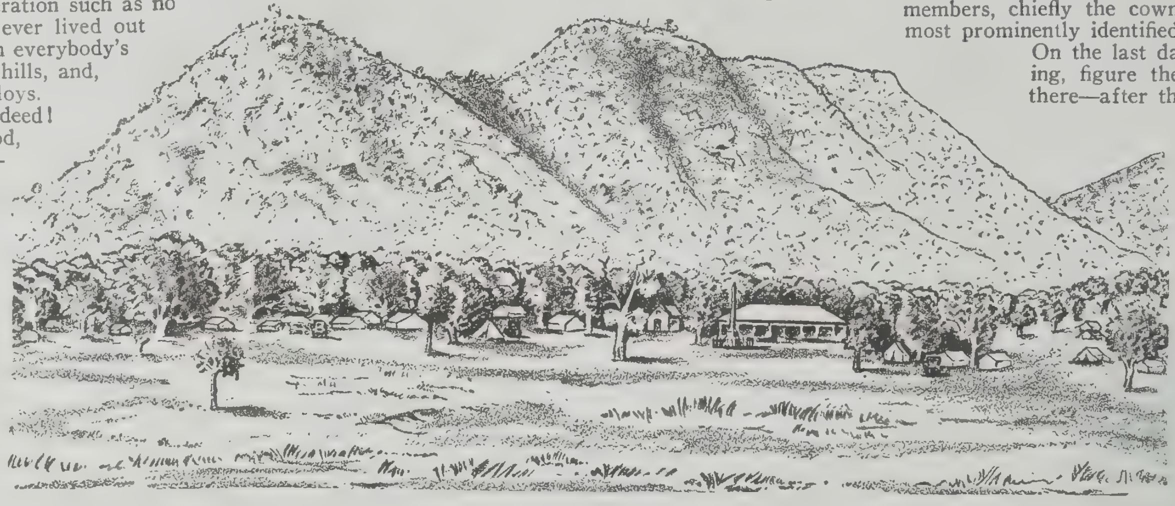
Bean was a double-fisted, rough-and-tumble adventurer. His career was stirring and picturesque. Judge Roy Bean he was, justice of the peace at Langtry, Texas. He ran a saloon and commissary, and from that strange seat of justice ruled over a territory larger than most states. When some writer put him into a magazine as "The Law West of the Pecos," there was given to that still maligned land a tradition which it eagerly seized and hugged to its bosom; a tradition only now passing out. If Roy Bean was the law west of the Pecos, the Rev. William B. Bloys was the gospel west of the Pecos.

I have recently attended a unique religious gathering. I was on hand when the ranch people of the West, for the thirty-fourth time since 1889, came together in Skillman Grove to renew their pledges to the Lord. The Cowboy Camp Meeting held forth for a week, and adjourned with an outpouring of praise falling from the lips of bronzed and brawny men of the range; yes, and their wives and children, and grandchildren.

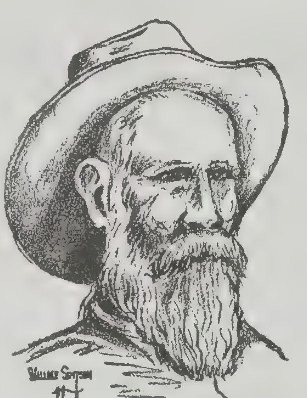
That is the secret of the long life of the Bloys cowboy meeting—the second and third generations are carrying on. The old-timers—men like G. Wash Evans and John Means, "Bill" Jones and "Ote" Finley, "Bill" Kingston and Cap'n Gillett—are gradually dropping upon younger shoulders the responsibility of carrying on the meeting while they, the old boys, uphold the traditions of the eating camps.

The meeting is held each year in a grove of live oaks, removed from the busy haunts of men. It is the cornerstone in a firm foundation of religion built in the West—the West that once was a haven for the lawless. Its influence is the dominant element in the life of a people scattered thinly over a territory greater in area than most states. And it answers the question that the first-time visitor finds himself wonderingly asking: How has it come that the ranch people of Western Texas are so filled with religion?

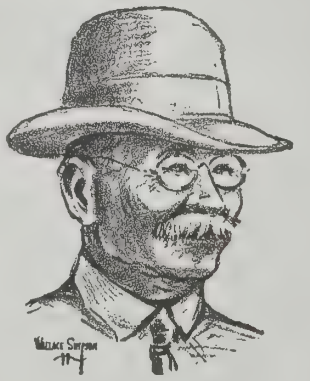
Mr. Bloys was seventy when he died. He was a Tennessean come to a wild land for his "health." Soon after his arrival at Fort Davis he began to spread out.



"A flashing jewel in a setting of saw-tooth peaks."



G. WASH EVANS.



JOHN MEANS.

He crossed the ranges to isolated ranches to which the Word had not been brought from the outside for generations. It was his wont to drop in any hour of the day or night, hold a religious service, baptize the children in whatever faith the parents designated, and inquire the way to the next ranch. He moved slowly and with effort until "Bill" Jones presented him with a spanking team of horses, but he covered the country. He covered it because he kept everlastingly at it—and about the first job he undertook was the organization of the camp meeting which bears his name.

While his regular charge was the Presbyterian congregation at Fort Davis, his territory covered all Texas west of the Pecos River. It was only incidental, his being a Presbyterian. He belonged to every denomination. He wore a Joseph's coat of many colors, a real mantle of Christianity which he wrapped freely around the heart of every man, every woman, and every child, who came beneath his influence or heard his gentle teaching. He taught the simple creed that God is the universal father, that Christ died to save sinners, and that the way to heaven is the path of rectitude. Denominational interpretations of Scripture meant nothing with him—he cleaved straight through to the heart of the Book, and taught the fundamental and thrilling old truths in a way that all could understand.

Which explains why the Bloys camp meeting belongs to everybody. It is interdenominational. A denominational sermon has never, in thirty-four years, been preached in the open-air meetinghouse under the trees, and never will be. In a third of a century the camp meeting association has made only two rules. One is that denominational lines are erased, and the other is that on the grounds there shall be nothing to buy. Everything is free—tents, bedding, meals, water, lights, food, and religion. You can enter Skillman Grove with bare hands and empty pockets; like Christ entering Jerusalem you can go in afoot—If you depart hungry and heartsore it is because you refused in your own willfulness to eat, drink, and, yes, be merry. No collection is ever taken at the services. The entire expense is borne by the members, chiefly the cowmen whose names have been most prominently identified with it from the beginning. On the last day they hold a business meeting, figure the expense, and raise it right there—after the visitors have departed.

The thirty-fourth annual meeting was a record-breaker in point of attendance. At the elevation of the meetinghouse, 6,000 feet, one can sleep out-of-doors without fear of dew, snakes, or bugs. On next to the last day I climbed to the top of Mount Bloys, standing guard over the grove on the east, and looked out over the traditional "sea of tents." At the morning service 1,500 persons wedged themselves in and around the meetinghouse. At the five eating camps dinner was served in relays. The crowd was so great as seriously to strain the facilities that have sufficed these many years. There was talk of suggesting to the old-timers—tactfully, of course—that they abandon the old style of free and openhanded hospitality and put the thing on a cafeteria basis. It ended in talk. One might as well have asked G. Wash Evans, or any of the others to give up their ranches as to ask them to give up the idea of serving free meals. They are not built that way, and neither was the West. They started out to be the hosts, those thirty-four years ago, and it will be that way as long as they live.

Those were wild days, when Brother Bloys crossed the Pecos in his buckboard. The first settlers were good Christian people—none better—but into their country had come the murderer and thief seeking concealment along the frontier. There was plenty for Brother Bloys to do. If he had been noisy and denunciatory, if he had turned out to be one of those political preachers, his career would have been short run. But he was neither nosey nor denunciatory. And as for politics, he attended to his own business, locked in his heart more than one red, dreadful secret, and the torch he carried brought the light of redemption to more than one hungry soul. He entered the frontier saloons and brothels as freely as he entered the consecrated mountain home. What he had he gave as generously to the two-gun bad man and dance-hall woman as to the white-haired ranch grandmother nodding before the fireplace with the open Bible in her lap. Thus, in time, he came to reign securely in the hearts of his people—all the people, good and bad.

One day in 1889—he had been in the country two years—Brother Bloys stopped at John Means' home. Let Mr. Means tell a bit of the story, as he told it to me on next to the last night of the meeting:

"He stopped at my shack to visit the family and hold a service. We talked about the need of getting the people together, and I mentioned this grove as being a good central location. His eyes snapped, and right there he laid out the plan of a camp meeting.

"We got some of the neighbors together in the grove and held our first service the next Saturday night. George

Great Plays in Sports Come Without Thinking

Participants in Athletics, Confronted by Crisis, Attain Heights That Bring Multitudes' Applause for Mental Brilliancy

By A Veteran Sports Writer

GREAT plays in sports are credited to the fast thinking of the players. In football, baseball, tennis, boxing, basketball and other sports there are plays happening infrequently which reflect upon the men that make them an intellectual brilliance that is phenomenal. These players, confronted by a crisis, suddenly arise to heights rarely attained and perform miracles.

Those who are experts in these matters go at length to describe the plays, to analyze them and properly to bring the greatness of the execution to the attention of the public. You read of these matters through each playing season. They are the deeds that carry the leading headlines on the pages of the newspapers and those that execute them are the heroes of the followers of their chosen sports.

And these deeds live through the years that follow. You still hear of plays made by Hinkey, the 150-pound end of Yale's days of greatness in football. He was the lightest end of his day and one of the greatest of all time. You can hear of the startling performances of Jim Thorpe, the Sac and Fox Indian of Carlisle. And they will relate how Heston, of Michigan, and Eckersall, of Chicago, demoralized opposing elevens by doing the considered impossible in crises. There are several hundred other great and near-great players in football whose plays are still recalled. Every section of the country has its quota of gridiron immortals and in the autumn of each year, while another squad is working for places on the 'varsity eleven, the alumni gather and recall the memorable plays of the past.

Credited to Quick Thinking

IN BASEBALL you can sit for hours while some veteran follower of the sport relates to you the marvelous performances of the first of the Delahantys, of Rusie and Radbourne, of Sockalexis and Childs, Long and Jennings, McGraw and McAleer, Keeler and Comiskey, of Lajoie and Wagner, Mathewson and Brown, Johnson and Alexander, Cobb and Speaker, Chase and Donahue, Carrigan and Criger, Walsh and Young. They and their fellow greats have furnished action for a thousand anecdotes.

In boxing one finds the high spots in the battles of Sullivan and Corbett, Fitzsimmons and Jeffries, Kilrain and Sharkey, Lavigne and Wolcott, Gans and Nelson, still subjects that hold attention in any gathering of devotees of sport.

Always, when these outstanding feats are described, they are credited to the lightning thought of the chief actor, to his ability to think faster than his opponents. It is this ability to think quickly that raises him above his peers, say the analysts.

These plays, famous in the histories of sports, are not the result of rapid thought, for there is no human being who can think as quickly as the action of the play. The mind is not capable of working fast enough to keep up with the action and, as everyone knows, to guide the action the mind would have to move faster than the arms and legs of the player.

We recall years ago a play that happened during a ball game. There were two men on bases when the batter hit the ball to the shortstop, one of the famous shortfielders of that day. Two obvious plays were open to this fielder but the play he made, one that proved dazzling in execution, was not obvious. It won the game and that evening we asked the player why he made that particular play, being curious to find out how he analyzed the situation in a second of time and made what ultimately proved the winning play of the game and an extremely difficult one. His reply was this:

"What else could I do?"

We pointed out to him the two obvious plays, either one of which the average player could have made.

"I never thought of them," he answered. "I made the one that came to me when I got the ball."

It would have required 200 words or more adequately to analyze the play this man made and the analysis would have astounded him. He, without governing his act by thought, made the play. Had he analyzed the possible situations before the ball was hit he undoubtedly would not have made that play but would have selected one of the other two, both simple and easy to execute.

Great deeds in sports are all the result of inspiration; the thinking comes after the execution, along with the analysis.

Action Held Spontaneous

THE spectacular plays that comprise the miracles of sport are made by the leaders, rather, the leading players. To explain these plays the chroniclers say the players are heady and think quickly. It is true that they make them because they are heady but not because they think quickly. What makes one player answer to the description of heady while another does not is because the one player devotes more thought to his work. He studies every fine point of play. He drills his mind in these points. He analyzes, digests and absorbs them. He becomes so perfect in the fundamentals and in the execution of these fundamentals that he finds himself doing the right thing when the occasion arises without pausing to think about what he is going to do. If he paused a fraction of a second to think he would be lost; rather the opportunity to make the play would have passed. The play has to be made so quickly that he does not get time to think and since he has given so much thought and attention to the action needed in the situation he goes through it naturally. The action is spontaneous; it must be to succeed.

Quick action is never properly described; it cannot be. No great play in sports has ever been accurately related. And it has never been pictured. The camera, like the mind, cannot properly photograph it. The action is too speedy for the motion picture camera, which loses much of the action in recording the scene and cannot reproduce it so that the spectator can properly grasp the play, and the slow motion picture camera is stupid and kills the effect that fast action produces on the optic. No one can gain a correct idea of what a play looked like by watching the play reproduced by a slow motion film, although the entire action will be recorded by this process.

In the Dempsey-Firpo fight in New York City in September, was furnished an unusually striking example of the impossibility of recording fast action. On the day following this fight not one newspaper report gave a correct account of what happened. This bout lasted three minutes and fifty-seven seconds and more than two hundred newspapermen, most of them veteran writers, including the most efficient in the country in that particular line of work, sat at the ringside and still when the leading newspapers of the country reached their readers not one could recount accurately just what happened during the three minutes and fifty-seven seconds these two giants fought for the supremacy of the ring. Not one newspaper in New York gave an accurate count of the number of knockdowns that occurred during the fight and the leading features of the event were muddled generally, not one witness having a clear and definite account of what transpired.

In this fight the picture changed so rapidly and the action was so intense that it was impossible to record the movements in chronological order mentally. At the finish of the fight everyone had a hazy idea of what happened and two or three features stood out clearly, but to assemble them in the order of their happening was impossible. It was all like a huge photograph torn into bits with some of the bits missing, and for the life of you there was no way to assemble the parts correctly. It was like watching the colors of a kaleidoscope and then telling the order in which they revolved. After one minute of action the thought became completely scrambled.

How the Picture Changes

THIS happens frequently in football games, particularly in those where there are many feature plays and more than average scoring. We recall one football game in which the winning team made five touchdowns. The fourth of these was the result of a line smash from the two-yard line, a play directed at center, following a double pass which carried the ball over the goal line. It was a dark day and the game was played on a soft gridiron. The players were covered with mud so that the broad and deep numbers on the backs of their jerseys, used to identify them, had been completely hidden. When the touchdown was scored the players were piled high, at least fifteen of them being in a struggling mass over the goal line. The raised arm of the referee finally informed the crowd that the ball had been carried over.

It was impossible to tell who carried the ball across but, being familiar with the play, we made a guess. Still, we wanted to be certain of our guess and after the game we went to the clubhouse to get definite information. At the door we met the coach and asked him. He said he did not know, he thought it was the fullback but he was not sure. He asked us inside. Stepping into the steaming locker room the coach yelled, "Who made that fourth touchdown?" There was no reply. He asked the question again. This time three players answered. Each player named a different man. The coach thought they were joking and told them that he wanted to know and was not attempting to be humorous. This statement brought a reiteration from the volunteer informants and also added a new name to the list. The coach then went to each man and asked and no one could tell him. Finally he took a vote and credited the touchdown to the man receiving the largest number of votes.

This incident is not unusual. The picture changes constantly in football, through four periods of play. The players, involved in new formations, never taking exactly the same steps play after play, cannot go back definitely and recall the picture at certain stages of the game. With eleven men in action on each side of the scrimmage line, each man springing forward as the ball is snapped, the scene becomes confusing to the eye and to the expert, trying to follow the play, it frequently creates a questionable impression. Given a moment in which to record what happened, he makes the best of it and passes to the next play.

One time a detective told us that the work of a prosecuting attorney was really simple. The prosecutor, said the detective, could prove the witness in any accident or criminal trial giving false testimony. He referred to eyewitnesses. In an accident, explained this detective, the action moves so fast that it is impossible for any witness correctly to make a mental record of what happens in sequence. He will tell what he believes to be the absolute truth but he will call on his imagination to supply the missing ends and his imagination will play him false. The picture changes so rapidly that the impression made in one fraction of a second is wiped out by that of the succeeding fraction. When the action is completed the mind has a correct impression of the final movements but only a hazy recollection of what preceded this, for the action flashed so quickly that no impression could be made lasting more than a fraction of a second.

To prove how inaccurate testimony could be made to appear he said he would ask any witness for his watch and then tell the witness to inform him how long he had owned the watch, how long he had carried it and the style of the twelve figures on the face of the watch. He had used this test time and again and he told us that men who had looked at their watches for fifteen years and more told him the face carried Roman numerals when it did not and vice versa.

Ty Cobb "Just Slides"

TY COBB, at fifteen, realized what few of us have ever realized. He discovered that great plays are not made by letting the mind guide the physical action. Cobb, at the start of his career, prepared himself for the execution of great plays by thoroughly mastering the fundamentals.

He was once asked to describe the eleven methods he used of sliding into a base. Cobb described them.

"How do you pick them?" asked his interviewer.

"To suit the situation," replied Cobb.

"Fast thinking, isn't it?" commented the interviewer.

"No, I never think about them. I just slide," answered Cobb.

And he never did think about them. Cobb, the greatest base-runner of all time, started at the age of fifteen to learn to run bases. He could not slide so he built a sliding pit, borrowed a canvas base and practiced sliding for a few hours daily. Then, during games, he slid at every opportunity. He slid into first, into second, third and home. Maybe he had a play beaten by twenty feet, where no other player would think of sliding, but Cobb slid. This constant sliding gave him the needed practice and learning. "I knew," said Cobb, "that if I slid every chance I got I would get so that I would slide naturally and away from the play, without thinking about it. I wanted to slide as naturally as I ran to first base after hitting a ball and I surely did not have to stand at the plate and think before starting for first. If I had to pause only a fraction of a second to make up my mind which way to slide when I wanted to beat a play, I would have been lost. I kept on sliding in practice and at times when no slide was demanded, until I did it without ever giving the matter the least thought."

Charles Brickley, of Harvard, greatest kicker in recent football seasons, was the most discussed player of his day. Several million words were printed in the English language relating to Brickley's quick thinking which enabled him to bring field goals out of the crisis in big games. How a player could calmly and collectedly kick a field goal when he started on a sweeping run and found himself the human mark for the streaking tacklers, became a subject for wide and deep discussion but Brickley, before he ever pulled a crimson jersey over his shoulders, had well prepared himself for just such plays. Brickley spent hours and hours kicking field goals. He kicked goals from all angles and under all conditions of wind and weather and footing. He kicked and kicked until kicking became second nature to him and until he drove the ball with his toe as naturally as he tucked it under his arm for a run. Brickley knew that to be successful he would not have a fraction of a second to make up his mind, to think about the execution.

Why Some Do, Others Don't

JOHNNY MOHARDT, one of the great backs of Notre Dame in recent years, told us that the secret of success in football was doing the right thing without thinking about doing it. To learn the fundamentals thoroughly was the first requisite. These completely mastered made it certain that the player would arise to the crisis; he would naturally fulfill the demand when it was made by the situation. He said he had repeatedly made plays that had never occurred to him before, plays that had never been mentioned to him. When they developed it was in the fraction of a second and he arose to the situation and executed them. It would have required many minutes for him to analyze the problem and decide upon the proper solution had the play been suggested to him in the locker rooms where football "quizzes" are held.

It is commonly believed that in our leading sports the men who execute plays think up the solutions as the plays present themselves. These solutions are arrived at like those in any other line of endeavor, but more quickly, according to popular opinion. The situation is similar to one in business where a man sits down and plans a selling campaign, or a change in the system of production. So the average man believes. But the athlete is just as incapable of thinking out a plan of action in the fraction of a second as is a business man.

The famous feats of sport are the result of inspiration. The secret of these plays is the secret of master paintings, sculpture, literature, science; the result of inspiration. The fact that certain men are able to make these plays and others are not is because certain men have gained a deeper knowledge, have studied more, have better mentality and also are finer equipped physically. The action with these players is spontaneous. They move too fast for human mind, or for human eye.

The Story of the Theft of the Kaiser's Ash Tray

An Heretofore Untold Post-Armistice Escapade of a Group of American Army Officers That Sought to Kidnap Wilhelm

By HENRY HILL

(C) Harris & Ewing

COLONEL LUKE LEA.

SOMEWHERE in America today there is an ash tray—quite a famous ash tray, made of bronze, and beloved of its owner as the memento of one of those escapades which almost made history. For the ash tray came from the castle of Count Bentinck, at Amerongen, Holland, and was taken by a party of American artillery officers, in lieu of Wilhelm Hohenzollern.

This plan to capture the ex-kaiser is little known; it has never been incorporated in the war annals of the A. E. F. but it is none the less a fact, and is one of the most amazing of the war's unwritten episodes.

We start in Luxembourg, a few weeks after the Armistice. The 114th Field Artillery regiment, of the 55th Field Artillery brigade, was quartered in the Grand Duchy, holding the line of communication for the Third Army on the Rhine. The billets were drab, the amusements few; and the activities required prior to November 11, by barrages, counter preparations, digging battery positions, and the like, were no more. Mere inspections of horse lines and battery kitchens could not be expected fully to occupy the officers' complete attention. Nor did it that of the commanding officer, Colonel Luke Lea, of Nashville, Tennessee.

Colonel Lea's career had been a distinguished one, both in and out of the army. In his early twenties he had loomed up large on the political screen in Tennessee. In the bitter battle between the wets and the drys he had carried on the work of the murdered Carmack.

The Plan to Seize the Kaiser

HE HAD gone to the United States Senate in his thirties, barely over the age limit. He had made a brilliant record there, and, when defeated in a primary for renomination for the senatorial post, had turned his full energies to the publication of his newspaper, the Nashville *Tennesseean.* With the outbreak of the war, he was commissioned lieutenant-colonel of the First Tennessee Field Artillery, had a great part in raising this new National Guard unit, and at Camp Sevier, Greenville, South Carolina, drilled it on wooden guns, but made an iron regiment.

The 114th got into the game in France right enough. It was at St. Mihiel, and in the Argonne. It had its share of mustard gas and shell wounds, of hard marches and fine achievements. But this story is not of the war, but of that time impossible to describe when the war had done, but men still felt it. In Luxembourg time hung heavy on the Colonel's hands; his active and resourceful mind was deeply interested in the debate in progress in the Allied press and parliaments regarding the necessity of punishing the kaiser. And the *sine qua non* of that was that Wilhelm be in Holland. It was just like the old recipe for rabbit stew: First catch your rabbit.

At Amerongen, as the "guest" of Count Bentinck, Wilhelm was a refugee on Dutch soil, and entitled to the protection of the queen's government. Wilhelmina and the States would have to consent to the release of the fallen emperor before the Allies could try him, and when sounded out on this point, the Dutch Government had pointedly indicated it would not do so.

So Colonel Lea evolved a plan to seize his former Imperial Highness, and hand him over to the French so he could be tried. The artillery commander's former position as a Senator had given him many friendships in diplomatic and higher army circles, and through them he secured passports for a party to cross into Holland, on a "sightseeing expedition." And one day in December the "tourists" started out, in two United States Army cars; the party included Colonel Lea, Captain L. S. MacPhail, of Nashville, Captain Thomas Henderson, of Columbia, Tennessee, and Lieutenant Ellsworth Brown, of Chattanooga, Tennessee, the latter the regimental radio officer. Five sturdy, resourceful enlisted men had been selected to go along.

In the plot, in addition to the Americans, were a Luxembourger, a Belgian officer, a German, and, unwittingly, a young Dutch soldier. The kidnapers had secured full information of the lay of the land, maps of the Amerongen section, and hints as to Wilhelm's habits. On the way from Luxembourg, the cars ran short of gasoline and Captain MacPhail went to the airplane park of King Albert, in Brussels, and there borrowed from the Belgian monarch enough "essence" for the final dash across the Waal.

When the party reached an inland Dutch city, and were ferried across the Waal, they hired a Dutch soldier to act as interpreter and guide. Rejoiced at the opportunity of making some *trinkgeld,* he unsuspectingly accompanied them to Amerongen. It was about dusk and too early for effective work, when the cars neared their goal. They waited at a secluded Arnhem inn until it was thought Amerongen would be quiet and the streets clear. Then Colonel Lea pushed on to Count Bentinck's house.

Received by Count Bentinck

THE Dutch soldier-guide finally began to scent a plot, but his fears were calmed and he was prevailed upon to show the way. The two cars halted in front of the count's large and well-guarded house. It was pitch dark, after nine o'clock, but some Yuletide festivities had kept the villagers up later than the visitors had counted on. Lea, MacPhail and Henderson presented their cards, and were received by Count Bentinck. The N. C. O.'s and Brown remained in the cars just outside the gate.

A careful examination was made to see if all communication between Bentinck's house and the outside world could not be cut. Apparatus had been taken to cut the phone lines and radio antennae, but the reconnaisance did not disclose any phone lines. However, Sergeant-Major Dan Reilly, of Franklin, was positive that radio antennae were mounted high over the castle roofs, and could not be cut without provoking "premature hostilities."

Inside, the Colonel, on another bent, had asked Count Bentinck, who with his son, the younger count, had nervously received the belated and unwelcome guests, to carry a message to the ex-kaiser, asking him to receive the party for an "interview." The Count, after considerable parley and hesitation, agreed to take the message. The officers began to prepare for a rapid seizure and dash. No immediate response was forthcoming, and the minutes grew until a half-hour had passed.

Meanwhile things began to happen outside. The full guard and retinue of the estate was quietly called forth from sleeping quarters, and paraded at the main gate in an imposing and threatening manner. A picked guard was detailed upon the main street. This only intensified the village sensation, and added recruits to the mob forming about the American cars. The usual custom was for a corporal's guard to stay at the castle, the rest keeping as inconspicuously as possible on the grounds of the Bentinck estate. Never had the American officers seen so imposing a group of soldiers, splendidly uniformed, tall, and well filled out, much after the fashion of old Friedrich Wilhelm's fabled guard of giants, as appeared in that main guard of Dutch soldiers.

The younger Count Bentinck, surrounded by a corporal's guard, inspected their arms and ammunition. Machine gun implacements on the walls were manned, and trained upon the gateway, the American cars, and the mob of civilians gathered outside the outer gate.

About that time the elder Count Bentinck came back with a message from "the Emperor," as he always called the former kaiser, to the effect that unless the Americans had permission from Queen Wilhelmina or an order from General Pershing, he could not receive them. The wily Hohenzollern evidently suspected what was in the wind.

The martial sounds in the inner domain of the castle, the cold tone of the reply, and threatening gestures outside, of which they were kept informed, dampened the kidnaping ardor of the artillery officers, who returned some equivocal reply, and left.

Mob Becomes Threatening

IN THE meanwhile, the N. C. O.'s and the junior officer had been having an exciting time of it. "They've come for the Ka-ser," some were heard to remark, and many came near the cars, to wish the raiders good luck. A few heavily armed squads of the kaiser's Dutch guard came to the gate, armed with flash lights, to inspect the American cars.

Luckily, while the long stage wait had been on, Brown gained information from Captain Henderson that all was not well inside. He and an N. C. O. gathered together the spare pistols, and put them under a car seat. They were lounging on this seat when the younger Bentinck and his warrant officer detail flashed their lanterns in the car and rudely poked about, ostensibly for firearms. During the inspection the young American officer and his men aped nonchalance as best they could, with fast-beating hearts. No guns were found, though each sat through the inspection with a .45 automatic stuck loosely inside his half-buttoned leather jerkin.

About this time the mob became more threatening, and the commander of the Dutch castle guard called on the villagers to disperse. Failing response, he threw a line of guards along the street and forced the curious crowd back a few paces. Shortly thereafter, Lea, MacPhail and Henderson came forth, without the kaiser, clambered in, and drove rapidly off.

It had been an exciting hour for them all. Had not the signs been so threatening, a rapid search of the house, a seizure of the kaiser and a dash for Belgium or the British Army area in West Prussia would have been the program. Once there, the Colonel had the way greased to Nancy, or Verdun, where he would have surrendered his capture to the French, and have received the plaudits of the rejoicing Allies.

As it turned out, the cars were delayed half an hour at midnight at the ferry over the Waal, due to the ferryman being called to the opposite bank before the Americans came up. Some of the members of the party think that in this time they would have been caught, their prisoner taken from them, and they themselves cast into a Dutch dungeon.

This little private party of the Colonel's would never have become known had it not been for the souvenir gathering propensities of Captain MacPhail. There was an elaborate bronze ash tray in Count Bentinck's smoking room, which Mac decided would make an excellent souvenir *de guerre.* He abstracted it, slipped it to a trusted orderly upon reaching France and for months the ash tray was "lost."

Count Bentinck asked the queen's government to ask Washington for its return; Washington asked Chaumont what had been going on, and General Pershing straightway summoned Colonel Lea, who until then had known nothing of the souveniring exploit, and other participants, to G. H. Q. where they were put on a carpet. Nothing was ever done to them, although they had a tight squeeze before the explanations were allowed to be satisfactory.

The "Imperial" ash tray, with its rampant bronze wolf-handle, is in its daily use in the MacPhail home, even now, a souvenir of the narrow escape the kaiser had from falling into the hands of the Allied and associated powers—and perhaps of the narrower escape the Colonel and his aides had from a dank Dutch dungeon.

Mr. Ford's Page

IT HAS appeared to some observers that there is such a concerted rush of young people for what are called "the white collar jobs" that it is becoming difficult to induce young men to go into the trades. There seems to be a feeling that work which involves the soiling of the hands or clothing is of a lower type than that carried on in lighted offices or over shining desks.

Of course, the great advance in labor conditions during the last decade has gone a long way toward reversing that notion, at least on the side of financial reward. There is a whole new school of jokes concerning the washerwoman who goes to work in her car and the plumber who rolls by in his limousine. These jokes, however, tell a story: they mean that the lot of the worker has risen and that in comparison with former days when labor was despised and poorly rewarded the position of "the white collar job" has not correspondingly advanced. This latter point is the part which causes the jokes to be made.

> *THE vital part of a business is not the office unless the office is an outgrowth and servant of the business. In the story of business the shop came first. When the office came it seemed to relegate the shop to second place, and then all the ambitious young men began to seek white collar jobs, thinking that the office was the path to power. This is likely to be a mistake, for reasons that are stated herein. The only possible way to justify the office is that it is the natural result of the business itself, manned by those who know and can direct the business, because they came up through the business, and were not merely superimposed upon it by their desire for clean jobs. The best road to the white collar is through blue-jeans and practical brains.*

The war also has revealed something of the relationship between the two kinds of work in that it has been the people who wear white collars who have suffered most, because there were fewer things they could do and because the things they could do were not emergency necessities.

Now, all this is not difficult to understand when it is known in what order of precedence these two kinds of work arose in this country. It is not far to look back over our country's development to see that work began with men doing things with their hands. Some of the greatest business concerns in the country grew out of a man working in his own small shop, making soap or candles or candy or wagons or plows or some other commodity of use. It was after the business grew with the growth of the country and the reputation of the product that the man found it necessary to bring in others while he himself put off his shop clothing to meet people in business relations. That is the true history of the origin of the "white collar job" in this country. It was first earned.

Of course, as industry grew, the institution known as the office became necessary, although it must be said that a lot of unnecessary things came with the office because it is always the tendency of the office to plume itself as if the business grew out of it instead of it out of the business.

The growing importance of the office has been a powerful factor in persuading young people that the way to reach the top of the business was by the white collar route. And it seemed the easier way also, the pleasanter way, with less heavy toil or smoke or noise. To write letters soon came to seem a greater thing than to make the article about which the letters were written. To talk business over a desk seemed to be a more important occupation than to create the commodity that made it possible to talk business over a desk. And thus the whole point of view became inverted; that which was second seemed to become first while that which was really and creatively first was relegated to second place.

The office has done its share of harm to business just for this reason. Unless it is kept in its proper place it is almost certain to become a brake on the progress of the industry itself. There are at least three things it is likely to do: the first is to take the manager himself away from the industry. The place of the manager is among the men. No man can be a boss except to the extent of his personal knowledge of every daily detail of the system for which he is responsible. When a man ceases to circulate among the very things upon which his business primarily depends, he is taking a risk which no wise man ought to take.

Then another possible source of danger from the office is the creation of two sets of people in a business, one of which is not likely to have the fundamental knowledge necessary to an understanding of the other. It may be assumed that the man in the shop, the actual producer, the cutting edge of the chisel, knows at least his part of the business. To that extent he is of importance to the business. When you get a whole shopful of men who know their parts of the industry, and then a whole officeful of men who know nothing whatever of the practical conditions and problems of the industry, the force is divided and the assistance the office ought to render to the shop is not given.

The third possible source of loss is in the condition described at the beginning of this page—the loss of ambitious, able young minds from the vital part of the industry because they have made a mistake as to which is the vital part. Of course, exceptional men have risen through the office, not by office means alone but through their understanding of the whole business to be able to serve it from the office end. Exceptional men, bear in mind! But if you look at the permanent backbone of any industrial organization today you will see that it is comprised of men who came up through the avenues of practical experience, earning their way by knowledge and service.

There should be no difficulty in understanding which is the vital part of the business. Just ask which part will survive without the other. Will the office survive without the shop? It may be asked, on the other hand, how long could the shop survive without the office? Not long, it is true, IF the office means the management of men who know the industry. But if the office only means those who have adopted the clerical profession, the case is very different. Unless the office is the helpful, managing, directing head of the business its position is not high; and to render it helpful, managing and directive it must be made up by graduates from the business itself. An office graduated from the business is still a part of it.

So that one would say, as a general statement, that the young man seeking a place to begin should seek it where he will learn most about the business he feels fitted or desirous to enter. If a young man is going to work in metal he should know metal, not merely bills of lading having to do with metal. He should get the touch of the basic thing itself. He should know it so thoroughly that there is no possibility of deceiving him and no possibility of his having to overlook new and better uses of it.

This does not preclude education. Technical education has its advantages but it does not constitute a qualification for leadership in an industry in which one has not served a practical apprenticeship. The best that education can do for the beginner is to make him a more intelligent beginner and enable him to profit more readily by the practical experience of the job.

On the other hand it is a question whether the right kind of man, with the advantages offered by great industries, cannot become as scientifically skilled through the process of study while at work, as in any other way. The young man who is willing to pay the high price of thought, and application and even devotion to his work, giving himself to it before all things—with intelligence, of course, and looking around occasionally to see what is coming in his field—need have no fear of failure.

And some day, if he wishes, he will wear the white collar, but he will not esteem it so highly as do others who have nothing else. He will gladly take it off any time and plunge himself again into the practical problems of the field he has chosen.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Was the President Told?

AT CHRISTMAS time, it is the custom of executives, state and national, to express the spirit of the season by granting clemency to certain deserving inmates of the penitentiary.

President Coolidge granted only a few pardons on his first Christmas in office. One went to Philip Grossman, who had been sentenced to one year in jail by Judge Landis, on February 7, 1921, for failing to close his saloon in accordance with a Federal injunction.

When the President's pardon was received, Robert Levy, the United States marshal at Chicago, announced that Grossman would be obliged to come to jail from his home to accept his pardon. For Grossman had not served an hour of his sentence. Appeal had been taken after his sentence, the higher courts had upheld the appeal, and Grossman had not appeared to serve his term, because, as Marshal Levy phrased it, he wanted to stay home and celebrate the Christmas season. Then came the executive's pardon.

There will be considerable curiosity throughout the country over the reasons which caused it to be such a merry Christmas for Grossman. The chief wonder will be whether the President's advisers acquainted him with the fact that Grossman had served no part of his sentence.

A Shocking Condition

THE Bureau of Housing and Regional Planning for New York State recently submitted a report of a survey into housing conditions in New York City.

It was a report of a wrong. But there was no recommendation of a remedy.

The New York report demonstrates clearly that conditions are never so bad that they can't be worse. Manhattan Island has been crowded for many years, crowded to the point which compelled all observers to insist that there was no room for more residents. But the crowding has been intensified, and the persons who live on Manhattan Island seem to thrive on congestion, bad housing conditions and unhealthful surroundings.

Rent charges which must be borne by Manhattan dwellers have gone steadily upward. The buyers' strike of 1920 did not seem to affect the New York tenants. The survey places the increases in rent at from forty to ninety-three per cent.

For this increase, the report says practically nothing was given in return. The landlord exacted all the rent which the traffic would bear, but the occupants of property were given practically nothing in the way of service and repairs. In fact the repair question was made into an ingenious method of ejecting a tenant when the landlord desired to raise the rent again. Under a New York law, passed a few years ago, arbitrary increases in rent are forbidden. To evade this law, the landlord nowadays informs the tenant of his intention to make costly repairs. The tenant, unable to pay for these repairs as required in his lease, moves. Then the landlord raises the rent.

Much of the extraordinary increase in rent charges was due to change in landlords. One of Manhattan Island's most profitable enterprises is the barter in leases. The original owner of a piece of tenement property leases it. The original lessor sublets it. The second lessor does likewise. And the process may go on indefinitely. The housing bureau reports that each transfer of the lease means an increase in rent.

Few vacant houses were found by the investigators. Even the houses on the Lower East Side had long waiting lists. Houses, formerly deserted as unfit for habitation, are now occupied. These houses have no heat, no hot water, no stoves, shafts and courtyards heaped with rubbish, and rooms so dark that gas must be burned all day.

Manhattan's housing problem is one which may well shock the country. The typical Manhattan dweller, often an exploiter himself, suffers from constant exploitation from the very people with whom he herds. The problem is difficult to deal with. If remedial measures are suggested, it is often the tenant's own protest which halts their enactment. For remedial measures, to be effective, would frequently destroy the tenant's own exploiting business at the same time it destroyed the power of the landlord to exploit him.

No Room for Partisanship

THE rules of party politics tighten in the months preceding a political campaign. Party leaders endeavor to manipulate political events so that honor may accrue to their ticket and credit for nothing be left free for the opposition to seize.

It is difficult to believe that this tendency can continue in the present Congress.

The program of legislation outlined by President Coolidge is not partisan. The measures which are likely to be the subject of active controversy are not partisan.

The two measures on which chief national attention has thus far been centered are the proposed Soldiers' Bonus and the revision of the revenue laws proposed by Secretary Mellon. In the last Congress, the votes of both House of Representatives and the Senate demonstrated that membership in the Republican or Democratic party did not affect the action on the adjusted compensation measure. The bonus, to which the President has indicated his opposition, is not likely to be determined by partisan motives this time.

But there are signs that party leaders are attempting to have partisanship enter into the passage or rejection of the tax reduction program. This is something the country is not likely to excuse.

The nation wants the taxes reduced. If the Mellon program is the correct way to reduce taxes, it should be enacted into law. If it is the wrong way, it should be rejected. If it has good points and bad points, it should be modified and adopted.

But in the passage, rejection or modification, there is no room for partisanship. There are different theories on which taxation may be imposed. But they are theories, determined by differing industrial and financial viewpoints. A tax levied on one theory may be less burdensome to the farmer of North Dakota than one levied by a theory which might be favored by the financier of New York. But it is absurd to contend that the Republican representative from one district of Chicago should vote for one theory of taxation and the Democratic representative from the adjoining district should support another theory.

There will inevitably be debate over the revision of the revenue laws. The theories of taxation will be discussed at length. And finally, some plan of revision downward will probably be adopted. In that debate and final vote, it is to be hoped that Republicanism and Democracy will be shelved.

Words Have Lost Their Power

PRESIDENT COOLIDGE is in favor of a short national platform which means what it says. His party and the Democratic party will do well to make brevity the platform key.

Prior to the Civil War party platforms were brief. Since then they have grown to unwieldy proportions. Few persons read them, least of all, it would seem, those responsible for carrying them into effect.

The party platform has become a repository of words. In recent campaigns, except on the one main issue of the year, the convention resolutions have been simply innocuous appeals to group votes. In a nutshell, each platform might read: We stand for everything that is good and will catch votes, and against everything that is wrong and will lose votes.

The time has come for a change. Verbosity and spread-eagleism are no longer popular. Campaign meetings are passing out. The platform of a great party should tell where the party stands, and let it go at that.

Immigration No Solution

ON THE side of those who favor opening wide the American gates to immigrants, are certain great corporations who hope through a surplus of labor to induce an era of low wages. E. J. Henning, Assistant Secretary of Labor, showed the National Immigration Conference how these corporations were working against their own best interests.

Mr. Henning told the conference that he had sent a man from the employment department of a great corporation to Ellis Island. This man was acquainted with his company's needs. He was given every facility for examining the situation among the new immigrants.

And his report is a startling one.

Not more than twenty per cent of all the immigrants were candidates for industrial positions. In other words, one-fifth of the immigrants were coming to the United States to work; the rest were coming to live by commerce, by peddling, by usury, by finance, and in general by escaping obedience to the mandate of earning their living by the sweat of their brow.

That means that eighty per cent of these immigrants must be supported by other men's labors. Great corporations, which hope through increased immigration to reduce their wage appropriations, are only stabbing themselves. For, the non-industrial immigrant is a burden on the country. He must be supported. This support, in the long run, must be divided among the productive forces of the country. And the great corporations which invite wholesale immigration must share in that support.

Mr. Henning's unofficial investigator found other remarkable facts. Of the twenty per cent of immigrants, willing to work, not more than one-half could qualify for jobs at all and only half of these, or five per cent of the total immigration, were capable of giving satisfaction to the employers.

The present Congress must meet the immigration question. The problem should be settled by determining the way to select American citizens, not by the noisy pleas of minorities or the selfish urgings of corporations, blind to their own real interest.

People to Blame

EVERY now and then some grave jurist or brilliant lawyer, responding to an after-dinner toast, insists that we must have a government of laws, and not of men. Laws, he points out, are the same yesterday, today and tomorrow, while men change their minds from hour to hour.

The confused layman believes we have nearly enough laws already.

More than 8,000 Federal statutes passed through the Congressional mill in the last ten years. An expert figures that there are 35,000 government activities. In 1923, the legislatures of two-thirds of the states had before them 32,000 bills. They enacted 8,300 of these into law. On the first day of the present session of Congress, limelight-seeking Senators and Representatives tossed into the hopper nearly 3,000 bills. Most of them involve the expenditure of public money.

Isn't it about time for a halt?

It is a profound legal fiction that everyone is presumed to know the law. On that theory, courts proceed. If a resident of Los Angeles drives into Salem, Massachusetts, he is presumed to know every little ordinance which may have been adopted at the town meeting since the days of witchcraft. Legally, he must know the law; actually, he can't. Millions of things are commanded and forbidden by state and national law, to say nothing of the township, village and city ordinances.

It has become almost a legislative axiom, that any time there is anything wrong, some new law must be passed. In the last quarter of a century, Government has ventured far into fields untouched by law before. It seems to be assumed that Government should do for the people anything that the people can do for themselves and do it easier.

Laws, even the most innocuous, require men, machinery and money to enforce, chiefly money. Bureaus and commissions have multiplied in our democracy to such a degree that we are not far removed from a simon-pure bureaucracy.

The condition is due to the failure of the people to participate in their government. They elect Representatives and Senators, then sit back negligently while pliable Congresses and Legislatures pass the laws that every Tom, Dick and Harry causes to be introduced.

The nation and the states have been producing too much law. It is time the pendulum swung backward.

When David L. Payne Led the Boomers

Eight Times Soldiers Turned Him Back, But He Forced Opening of Oklahoma

By JEAN M. CHRISTMAS

DAVID L. PAYNE.

This photograph of Payne, taken during the Civil War, is suggestive of his picturesque career as soldier, frontiersman and Indian fighter.

THERE is an old story of a man who once led a great band of settlers to take possession of a country that had been promised them. But the leader, after years of struggle and disappointment, died before ever the conquest of this wonderful country began, though the Lord comforted him with a vision of it from a high mountain.

The story has a parallel in American history, and the name of the leader who died before he could enter the promised land was once known all over the United States, although there is only one state where it now remains unobscured. Even there it has been slightly misted with legend.

David L. Payne, soldier of fortune, pioneer, adventurer, has been called the "Father of Oklahoma." His name is as indissolubly linked with the history of that state as is Daniel Boone's with Kentucky. For five years he struggled against heartbreaking obstacles and the opposition of powerful interests to open the Oklahoma country to settlement, and although he never lived to see the fulfillment of his dreams, the credit for the final triumph has been unanimously accorded to him.

How great were the hardships he endured and how fervent his faith and ambition are shown fully for the first time by diaries and letters of Payne which have been recently acquired by the Oklahoma Historical Society. The entries in these diaries and the correspondence reveal intimate glimpses of Payne's remarkable career, and, pieced together, form a simple but dramatic epic of the pioneer.

Pioneering, that strange urge, that instinct which seems in some men stronger than self-preservation, was in Payne's blood. His birthplace and early home was on the western frontier in Indiana. His mother was a first cousin of Davy Crockett, who gave his life for Texan independence. As soon as Payne was of age, he left his native state for Kansas, the newest frontier, where he took up a homestead.

Three years later the Civil War began, and Payne lost no time in donning a blue uniform. He served out his term of enlistment, returned to Kansas and was elected to the state legislature, but re-enlisted after its adjournment, taking the place of a drafted man who had a large family to support.

After the close of the war he served in various capacities, one being as postmaster at Fort Leavenworth. But this was too peaceful an occupation for his taste, and when the fires of Indian rebellion flamed up, he left his post office to a deputy and volunteered for the Indian wars. As a captain of cavalry, he performed gallant deeds under Custer in Southwestern Kansas, Western Oklahoma and the Texas Panhandle. Custer greatly admired Payne's bravery, and the men under his command called their captain "Old Ox Heart."

During the campaign, cholera attacked his company. Payne himself nearly died, but he showed an absolute carelessness for his personal safety and comfort in caring for his men. He took the weakest ones to his own tent, nursed and fathered them, paid to have others taken care of, and even took off his own woolens to clothe a sick man who was suffering extra tortures from the cold.

While he was still actively campaigning against the Indians, the deputy in the Fort Leavenworth post office defaulted, and Payne's bondsmen were held for the money. To make good this amount, the captain sold all his property, and was once more a poor man.

Instinctively his thoughts turned again to pioneering, and for the second time he settled on a homestead in Kansas. Again he was elected to the legislature, and distinguished himself by introducing and securing the passage of a bill removing the political disabilities of the ex-Confederate veterans against whom he had fought.

After 1872, his restless spirit drove him forth once more from his Kansas farm to wander about for several years, until at length he appears as assistant doorkeeper of the House of Representatives at Washington. And here he found the work that he was to do.

It came about through his meeting, in the Congressional halls, Elias C. Boudinot and others who were interested in opening to white settlement what was becoming known as the "Oklahoma country." This consisted of a great tract of land in the heart of the Indian Territory which had not been assigned definitely to any Indian tribe as their home, or reservation. All the rest of the land surrounding it had been parceled out in tracts large or small to Cherokees, Choctaws, Creeks, Seminoles, Otoes, Chickasaws, Comanches and other tribes. The numbers of these peoples had been wasted away by wars, hardships and disease, until in 1879 fewer than 75,000 were left to occupy the 27,000,000 acres of their new territory. Mostly, too, they were but half-civilized, and did not cultivate the land, but lived on the government's bounty.

This great expanse of almost unoccupied country naturally attracted the covetous eyes of the cattle raisers of the surrounding states, where pasture was at a premium, and without asking anybody's permission, they soon began driving their herds across the border and building their ranch houses. But they had to reckon with the Indians, who made the cattlemen sign leases and pay at least a nominal sum for the use of this grazing land. The cattlemen paid something like two cents an acre, but immediately thereupon assumed airs of ownership and began fencing in their leases. But in the unassigned land, the "Oklahoma country," they grazed their cattle and paid no one, since no tribe could claim a right to it.

Here, too, they raised fences, and these fences often represented the property privileges of no ordinary cattlemen. "Big interests" were involved. One or two railroads and some rich English syndicates were said to be interested in everything that went on in the Oklahoma country. These, with the wealthy cattlemen of Texas and other states, combined to oppose the coming of the plow, and appeared, moreover, to enjoy the protection of the government.

All this Payne learned in Washington from Boudinot and the others. Boudinot had already made one or two unsuccessful attempts to get the Indian Territory opened for white settlement. Then Payne came home from Washington. The real battle for the opening of Oklahoma was on. From that time on, for five years, Payne never faltered, never relaxed, never despaired.

He began by organizing "Payne's Oklahoma Colony," soon nicknamed "the boomers." He lectured, he advertised, he made shrewd use of publicity of all kinds. Adventurous spirits and home-seeking pioneers came from all over the nation to join the colony, or sent in their fees. At one time the colony had as many as 15,000 members. The membership fees varied from one dollar to six, and absentees paid $25 to have a lot chosen for them in the prospective towns.

Payne wasted little time in beginning his efforts at actual colonization. President Hayes issued a proclamation in 1880, warning the settlers that they must not enter the Indian Territory and ordering the army to enforce it. But the boomers answered, "What about the cattlemen who are already there?" and, secure in what they considered their rights, ignored the proclamation. In April, then, Payne led his first expedition across the border and chose a site on the north fork of the Canadian River, where Oklahoma City now stands.

The colonists came in their covered wagons, those sway-backed, canvas-topped "prairie schooners," which were familiar for many a long year on Oklahoma roads, and even now may be seen sometimes on the dusty trails. Usually a bearded, coatless man drove the tired horses. The wife sat on the seat beside him, holding the tiniest child on her calico lap. The other children peered out at the back, cramped up among the household goods. Buckets and frying pans rattled against the sides of the wagon, and a dog or two trotted along beneath in the grateful shade.

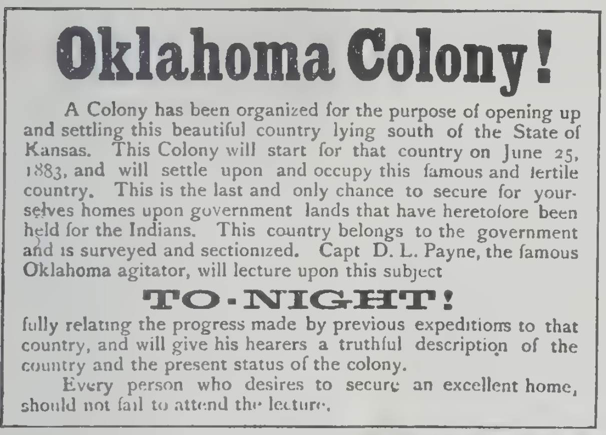
As soon as they had selected their land, the boomers began to build their homes. These consisted generally of what was called a "dugout," a cellar or cave dug in the red clay and walled and roofed over with timber and heaped-up mold. Such dwellings were not only cheap and convenient, but also the safest kind on the prairie, where cyclones were frequent and terrible.

But the settlers had hardly time to complete these primitive homes, for in May the soldiers came. The colonists were arrested and driven to Fort Reno, thence led to the Kansas border, where they were released June 7.

Payne was not to be discouraged so easily. Within a month, he made his second attempt to take possession of his Oklahoma "homestead." He was again arrested and taken to Fort Reno. Before being released this time, however, he was carried on to Fort Smith and cited to appear before the Federal court at the November term. While awaiting trial, Payne set about organizing his third colony.

The boomers this time planned to cross over the first of November.

(*Concluded on page 13*)



Oklahoma Colony!

A Colony has been organized for the purpose of opening up and settling this beautiful country lying south of the State of Kansas. This Colony will start for that country on June 25, 1883, and will settle upon and occupy this famous and fertile country. This is the last and only chance to secure for yourselves homes upon government lands that have heretofore been held for the Indians. This country belongs to the government and is surveyed and sectionized. Capt D. L. Payne, the famous Oklahoma agitator, will lecture upon this subject

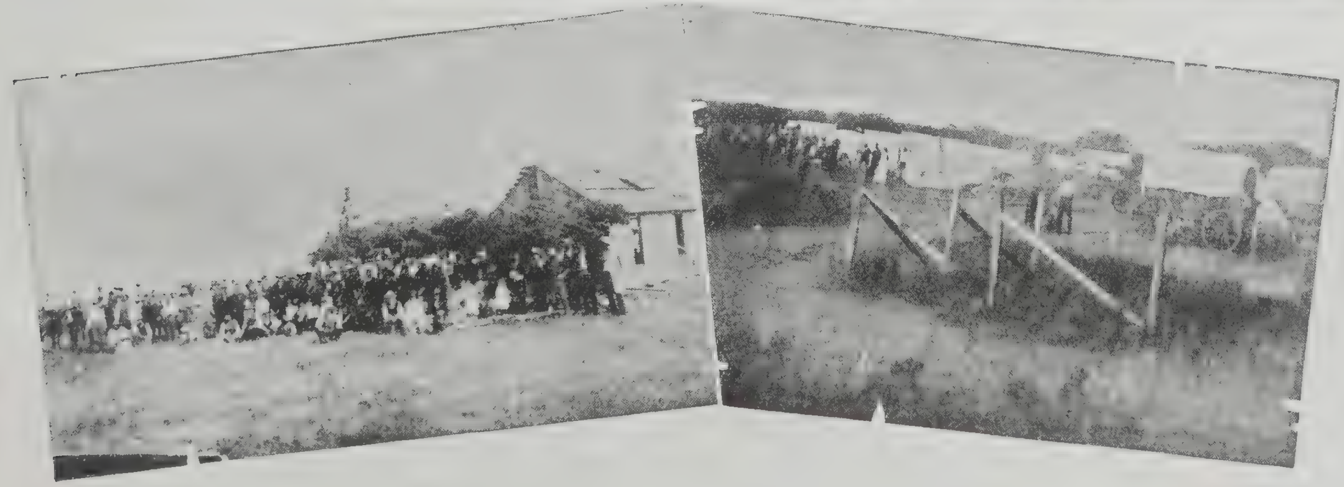
TO-NIGHT!

fully relating the progress made by previous expeditions to that country, and will give his hearers a truthful description of the country and the present status of the colony.

Every person who desires to secure an excellent home, should not fail to attend the lecture.

Above—One of the circulars employed by Payne to interest recruits in his expeditions designed to settle Oklahoma Territory.

Right—The imposing sky line of Oklahoma City, capital and metropolis of the state, rises on the site which Payne's first colony selected as its home, a substantial realization of the dreams of that intrepid pioneer.



Below, left—Office of the Oklahoma *War Chief*, Payne's newspaper, showing his colonists in front of the building. Shortly after, the soldiers tore down the building and threw the printing presses into the river. Right—The boomers in camp near the Oklahoma border preparing to cross into the promised land.

The Nordica Clubs of Washington

Amateur Orchestras Win National Repute

By D. S. BURCH

AMONG the active musical organizations in the nation's capital is an amateur mandolin and guitar orchestra which is having a most successful career. It represents nearly a quarter of a century of effort on the part of its director, Walter T. Holt, who developed it from a small beginning. The instruments used are all of the "fretted group" and include mandolins, mandolas (tenor and octave), mando cello, guitars and mando bass.

Twenty-four years ago Mr. Holt began his organization with thirteen members. In the spring of this year, he put his orchestra of nearly one hundred players, many with less than two years' instruction, on the concert platform at a leading hotel and rendered a program including two of the world's most beautiful symphonies. These were Beethoven's Fifth Symphony and Schubert's Unfinished Symphony. The American Guild of Mandolinists, Banjoists and Guitarists was in session in Washington at the time and its members, as well as the public, were unusually generous in their comments of appreciation.

"This concert," Mr. Holt said when interviewed, "is the culmination of long, patient effort and shows the possibility of rendering the highest class of music on instruments which, though having popular appeal, rarely have received the serious musical recognition of which they are worthy."

The technic which the instruments demand is of but moderate difficulty and can be acquired in from two to three years of study. Proficiency is then largely a matter of practice and individual talent.

"In addition to making a living for myself," Mr. Holt remarked, "I am doing something that brings pleasure to others. The organization gives its members a form of diversion that they enjoy and appreciate. It brings them together in mutual effort, and while it does not provide the musical education that is the basis of large professional orchestras, it satisfies the normal and commendable craving for some form of musical expression. Naturally the personnel changes from year to year, and it means a great deal to me to receive a letter from a former player stating that he or she is playing in public, or teaching music, or has perhaps organized a small mandolin orchestra in some distant city or foreign land. Several have become quite prominent teachers; one is active musically in China, and another in the West Indies. Former pupils and orchestra members are continuing their efforts in nearly every state."

Goes Back Many Years

THE Nordica Mandolin and Guitar Orchestra, as the organization is called, is now in its twenty-fourth year. It has played before gatherings of all kinds, has been received at the White House on several occasions, has been one of the feature attractions during the annual music week in Washington, and occupies the distinction of being perhaps the largest permanent organization of its kind in the United States. Numerous selections suitable for a mandolin orchestra have been written and dedicated to it by well-known composers, including Mr. Holt, who is a writer of music as well as a teacher, virtuoso, and orchestra director.

During the construction of the Panama Canal a small mandolin group, selected from the Nordica Orchestra and led by Mr. Holt, was sent by the Government and the Young Men's Christian Association to tour the Canal Zone for a series of concerts provided for the workers there. So successful were the entertainments given that the general secretary of the Young Men's Christian Association has credited the organization with having "a real part in the construction of the Panama Canal."

As supplements to the orchestra Mr. Holt has developed an Hawaiian Guitar and Ukelele Club and also a Banjo Club which appear on most of the programs and lend diversity to them. Some of his pupils, after having acquired proficiency on one instrument, take up the study of several and play in all three clubs. Membership is not contingent on continued study, however; in fact, the organizations are made up of only about one-half of those who take lessons. The remainder includes persons who have gained the necessary skill and experience and for whom the clubs are now an incentive for practice and a source of social diversion. Each club member pays the nominal sum of fifty cents a month to cover incidental expenses.

Pupils From Nine to Seventy

MANY friendships naturally arise in such an organization; the instruments are known as the "sociable group." Frequently players organize small groups for practice and small engagements, and Mr. Holt approves this form of activity. The organization is directly responsible for six marriages and indirectly for others. Recently a player whose wife died requested that all the pall bearers be members of the orchestra and such was the response that not only did this occur but many others who learned of his sorrow went to the funeral.

In the ways mentioned, and many others, the Nordica Clubs, as they are called collectively, have become established as a part of the musical and social life of Washington. Last year, shortly before Christmas, several members proposed an essay contest on the subject, "What Music Means to Me." It developed some unusually meritorious contributions which appeared in local newspapers, as well as in the musical magazines.

The clubs are primarily musical rather than literary or social groups, however, and in his choice of music and programs Mr. Holt has kept them so. Among the selections which have been rendered with particularly warm receptions recently are such a diversity as Orpheus Overture, Day in Venice, Egyptian Ballet; Morning, Noon and Night in Vienna; Lost Chord, Liebesfreud, Badinage, and Prelude in C Sharp Minor. On one occasion the Lost Chord was rendered, accompanied by the largest pipe organ in Washington, with noteworthy effectiveness. Popular selections have included medleys and music of the lighter kind.

Two of his players have been blind and both of them, being musically talented, learned to play so well that they became teachers. Instruction involved reading the notes to them, but in spite of the obstacle of total blindness they became excellent players.

(C) G. V. Buck, Wash., D. C.

WALTER T. HOLT,

Organizer and director of the Nordica Clubs, Washington, D. C.

Age has been no barrier. The pupils have ranged in years from nine to seventy. A number of left-handed persons have become members of the orchestra, all of them learning to play their instruments right-handed. Since both hands are used, this accomplishment is not difficult although pupils are often surprised to find that they are right-handed only in their musical efforts. Instruction in this case merely involves training the hands and fingers in the right manner.

Those who hear the Nordica Clubs for the first time and who expect the director to use a baton are surprised to see Mr. Holt standing among his players and playing a mandolin as well as directing. This form of leadership has been very successful and has given the groups recognition for correct time and delicacy of expression.

Mr. Holt was recently re-elected president of the American Guild of Mandolinists, Guitarists and Banjoists, which is the organization having in charge the welfare and development of those instruments. He is assisted in teaching and in directing the club by Miss Alice E. Hill, former pupil. He also has a secretary-bookkeeper, Miss S. F. Harvey, who attends to necessary business matters.

The personnel of the Mandolin Orchestra, the Hawaiian Guitar and Ukelele Club, and the Banjo Club includes between one hundred and forty and one hundred and fifty players, all of whom are products of his training. The membership necessarily changes from year to year, especially in a city like Washington where the population is itinerant. Yet in spite of the difficulties, some years, in developing an organization from almost new material, the programs have included music of increasing difficulty and have been winning more and more approval from the press and the public.

The Gospel West of the Pecos: Memories of Other Days

Concluded from page 4

Evans and his folks were there, the Bill Joneses, the Finleys, the Kingstons, and some cowboys. We cleaned out the brush and built a little arbor. We had a two days' meeting, and I want to tell you, the word of God sunk deep. Mr. Bloys said we must make it interdenominational. He was a Presbyterian, I am a Baptist, some of the others are Methodists and Christians—you get the idea.

"We set out to buy the grove. The price was two dollars an acre, $1,280 for the section. Well, we were all mighty poor, new in the country, just starting our herds. It looked like a lot of money, but we raised it, at one sitting. When we started our improvements we bought rough lumber because it was cheap, and Mr. Bloys planed it himself. He was a first-class carpenter."

"So was Jesus, you remember, John," broke in "Bill" Jones, quickly. Mr. Means nodded.

"Well, we opened for business. We had a hymn—it was 'How Firm a Foundation.' We've sung it ever since—always open the meeting with it. Mr. Bloys preached a sermon of Thanksgiving, and then took the children off to one side and told them Bible stories. We did not know much about the Bible, and felt ashamed of our ignorance, but he would only laugh at us and tell the story of the two lawyers."

"Bill" Kingston slapped his knee.

"That *sure* was a good one. Tell it again, John," he urged.

"Two lawyers made a bet. One bet he could say the Lord's Prayer without a break and the other called him. He started off, 'Now I lay me down to sleep,' and the other lawyer said, 'Well, Joe, you did it. I didn't think you knew it!'"

A murmur of reminiscent laughter went around the camp fire.

"A Christian Country Now"

"THE eating camp idea just grew," Mr. Means went on. "We organizers put in our own camps to feed the people, buying what was needed ourselves and butchering our own cows, and we've kept it up. We sort of felt like the people ought to be taken care of, since we started the thing. We've always tried to feed them good grub."

Good grub? For supper that night the Means-Evans-Gillett outfit served roast beef and gravy, chili con carne and frijoles, stewed corn, fried potatoes, hot biscuits and butter, stewed apples, plum preserves and hot coffee—and the same sort of meal was served at every other camp.

"He left us, six years ago," John Means said, after a long pause. "His heart was too big for his body—he only weighed 120 pounds—and one day at Fort Davis it just stopped beating while he was sitting in his chair. He was just wore out. He'd often said that his work was done, that there wasn't anybody left in the country to be brought to Jesus, and if he meant it that way I guess he was right. This is a Christian country now—she's cleaned up for good, end to end—and the man responsible was Brother Bloys. He left us this camp meeting and this grove, the most sacred spot for these families that ever was, or ever could be, placed on this earth."

Mr. Means spoke the truth. To say nothing whatever of its stately beauty—lying there in the heart of the mountains, a flashing jewel in a setting of saw-tooth peaks—there hangs over it the intense suggestion of consecration. It literally comes out to meet the visitor as he arrives, and hovers about him as long as he remains. Not blatantly, in loud shoutings and hysterical hallelujahs, but in the quiet and earnest faces of the people, in the hearty welcomes, and in the services of which a half-dozen are held daily during the session. There is nothing sensational about the preaching. After two songs and two prayers the preacher gets right down to business, and in an hour the meeting is over—no collection.

"Brush Meeting" 31 Years Old

THE young men's and boys' meeting is called the "brush meeting" and it, too, is an institution of long standing, in its thirty-first year. At a recent gathering Joe Evans presided. Joe is the son of G. Wash Evans, old-timer, and when he called for the second and third generations to stand and be counted, in the number were sixteen sons and grandsons of the men that had organized the camp meeting association.

Clinching it, for eleven consecutive years not one indictment was returned by the grand jury of Jeff Davis County, in which Skillman Grove is located. As for that, serving on the grand jury of any county of Western Texas that has felt the feet of Brother Bloys has been, through all the years, not merely a formality, it has distinctly been a waste of time.

The tradition of Roy Bean, that rip-snorting justice of the peace, is passing since that phase of the West has slipped into the dusk of history. Not so the tradition of Brother Bloys. The problem which he grappled with was not a phase at all. It was a condition having its counterpart in every corner of the globe where the human family has gathered to furnish material for the soul savers. It has always existed, and it will continue to exist always. What Brother Bloys won for his Master is attested to by the congregation in Skillman Grove. When it bears down on the stately notes of the opening hymn, "How Firm a Foundation," it is doing something besides singing a hymn. It is chanting a bit of the authentic history of the West: that part of it which has had to do with the building of a Christian spirit in the cow country by the little carpenter-preacher.

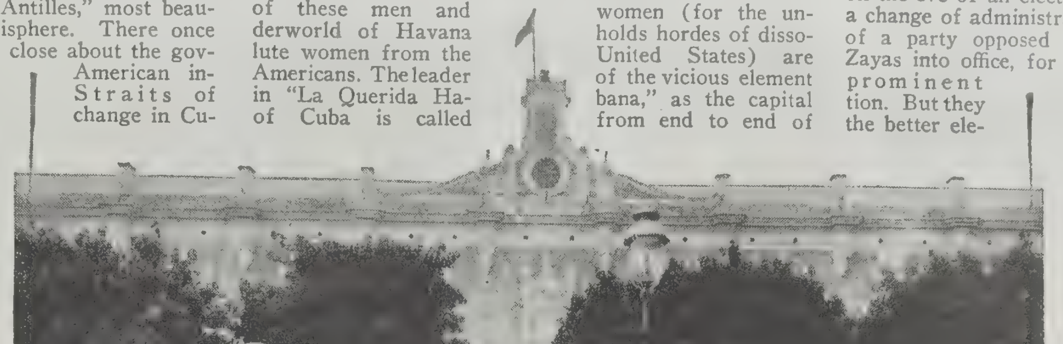
Pearl of the Antilles Dissolving in Rum

Havana Declared by Patriotic Cubans to Be Refuge of Vicious Elements

By HARRY H. DUNN

A GREEK lady, dominant for the moment in Egypt, is reported to have dropped a pearl in her chalice of wine, thereby destroying the gem and getting for herself what was, in those days, enough publicity to make all the other queens of the world madly jealous. A score or more of centuries later comes a New World ruler charged with dipping his country—also called a pearl—in an ocean of rum, thereby destroying it, a gem which is still less his to dissolve than was the pearl which was the property of the lady who originated the idea.

As a living example of the results of the uncurbed distribution of alcohol, those Americans who are endeavoring to make void the prohibition law, and those foreign elements which are defying it, would do well to look long at Cuba, "Pearl of the Antilles," most beautiful island of the Western Hemisphere. There once more revolution draws its steel net close about the government, and the spear-head of American intervention lurks just across the Straits of Florida. So great has been the change in Cuban affairs since prohibition was invoked in an effort to restore the United States to normalcy that the country faces a deficit of more than $15,000,000 for the present fiscal year, the budget is running $1,000,000 a month ahead of the revenues, and, for the nine months of the year ending with September 30, the deficit between revenues and expenditures each month was approximately $1,500,000.



The main entrance to the president's palace, Havana.

More than this, and vastly more important to the people of Cuba, the moralization program agreed upon by the present government when the United States insisted upon honest elections in the autumn of 1920 has been completely abandoned by the administration headed by President Alfredo Zayas. It will be recalled that Mario G. Menocal was president of Cuba prior to last April. The election by which his successor was chosen was held late in 1920, and, with the United States supervising the elections, Zayas was named president, on a platform agreeing to improvement in the moral conditions of the country. He took office in April. By improvement in the moral conditions was meant the elimination of graft among officials; closing of the gambling houses, including the national lottery; limitation of the liquor business and assistance to the United States in the elimination of liquor smuggling into this country; revocation of the so-called "Tourist Law," by which criminals fleeing from this and other countries may remain for a considerable period in safety in Cuba as legitimate tourists, and several other objectionable conditions, all growing out of the liquor traffic.

(C) Int. F. S.

PRESIDENT ALFREDO ZAYAS, of Cuba, broadcasting his political propaganda from the national palace in Havana. Because of the tremendous influx of American money to Cuba, due to the establishment of prohibition in the United States, he has abandoned the "moralization code" on which the United States insisted when Washington supervised the Cuban presidential elections in 1920.

The Cubans themselves, like most Latin-Americans, are not heavy drinkers. They use light wines, some beer, and a number of native drinks containing a small amount of alcohol. There never has been, and is not today, a popular or profitable sale of whisky, gin or the brandies of high alcoholic content in any country of Latin-America, except among the foreign colonies. Cuba was not without graft, and not any more moral in other respects than the rest of the Latin-American republics, prior to the passage of the Eighteenth Amendment in the United States. But since that amendment, the evil influence of the horde of liquor dealers, gamblers, traffickers in women, and grafters who depended on liquor to enable them to "put over" their schemes, has worked such a tremendous change in the Pearl of the Antilles that her own people declare her to be the leader in governmental graft, drunkenness, poverty through gambling, and general dissolute practices among all the countries south of the Rio Grande.

This is not a charge made by foreigners, casually surveying the show-places of vice maintained for the tourists, but the arraignment of the government by a non-political organization, comprised of the Cubans, largely of the middle class, led by men who were prominent in the revolt of the island against Spain, and who always have been friendly to the United States as well as prominent in the development of their own country. The organization is known as the Circle of Veterans and Patriots. It stands flatly upon the Platt Amendment to the treaty between the United States and Cuba, and it appears to be the only wall between American intervention and the island republic. Even it will not serve much longer as that wall, unless it can prevent the further wrecking of Cuban finances, economics and morals by the present government.

It might seem to the distant spectator that these conditions in the island are the natural outgrowths of the rise to power of dishonest men in the government, yet every bit of graft taken, every "trick turned," every incident of queer financing, can be traced directly to the influx of saloon keepers, liquor dealers, gamblers and other underworld characters, driven from the United States by the prohibition amendment. Few of these men and women (for the underworld of Havana holds hordes of dissolute women from the United States) are Americans. The leader of the vicious element in "La Querida Habana," as the capital of Cuba is called from end to end of Spanish-America, was known to his associates in New York as Sol Lipschutz. In Havana, he calls himself "Colonel Labios," and claims to be a Spaniard. In truth he is a Russian Jew, and close connection between him and the national government of Cuba is charged by the veterans and patriots.

The right-hand man of this Lipschutz, or whatever his name may be, is an Italian, born in the Argentine, and known to the night-life of San Francisco as "Papa" Fierro. With him is associated a man going by the name of Arturo Morgan, who allowed it to be known in Havana for some time that he had connection with the Morgan firm of bankers in New York, and who endeavored to take some credit for the arrangement of the $50,000,000 loan which the Morgans made to Cuba not long ago, and the $5,000,000 loan made a few months later. "Morgan" is also a Jew, formerly a salesman for a liquor house, working out of New York, under the name of Levhine or Levin, authorities on his past differ as to the spelling. The underworld of Havana, which is to say, Cuba, is divided between these three, with Lipschutz taking the greatest share.

It is probable that a percentage of the graft from the gamblers, the liquor dealers, and the men who trade in women, goes to some officials of the Cuban Government, but it is worthy of note that not one Cuban is known to be in the ring which controls the vicious element in the island. Beyond this, it is a certainty that the present government of Cuba knows of these conditions, all of which are directly traceable to denizens of the underworld of several American cities who fled the United States either when the prohibition law was passed, or when that law made it no longer safe for them to remain in New York, Chicago or San Francisco. It is also a certainty that from the influence of these masters of the tenderloin has come the so-called Tourist Law, mentioned above. From it, too, has grown the general attitude of protection for foreign criminals, especially American, who may flee to Havana. Ask any agent of the United States Government who has as his duty the apprehension of American lawbreakers in foreign countries, and he will tell you that the most difficult country from which to bring back an American criminal is Cuba. It used to be Honduras; during the war, it was Mexico; now it is the country which owes her very life to Uncle Sam. And all because the army of booze, and its allies, gambling and prostitution, have become entrenched in Havana.

There are, of course, other charges against the present government of Cuba, but every one of them is directly traceable to, and the acts of which they complain are contemporaneous with the floating of a horde of renegades from the United States on a tide of rum into Cuba. Understand that these charges are not made on the eve of an election; they have nothing to do with a change of administrations; they are not the allegations of a party opposed to the party which put Alfredo Zayas into office, for many of his former partisans are prominent members of the new organization. But they are the combined voices of all the better elements in Cuban life, and the summary of their arraignment is that unless the nation is made morally clean, and the government purged of its dishonest members, there will come, first, the wrecking of the country; second, revolution; and, third, intervention by the United States to establish protection for life and property.

It is worthy of note that in this movement, unlike others which have from time to time arisen in Latin-America, there is no mention of any man to succeed Zayas, no demand for his removal, nor yet the naming of any clique seeking to take over rule of the country. The demand is simply for reform within the government, and not change in the administration. Apparently, for the first time in the history of southern republics, there is no personal ambition involved in the movement of the Cubans to clean their own house, but it is to be believed that if they succeed there will be some very difficult days for the Jews, the Italians and the other Europeans, who, masquerading as Americans and coming from the United States, have made of Havana a cesspool of the dregs of vice, drained from this country through the Eighteenth Amendment.

The demands of the veterans and patriots organization fall under twelve heads, and each demand carries within it the charge that the condition exists whose remedy is sought. Translated and summarized, these demands are:

First: The repeal of the Tourist Law, under which fugitives from justice from other countries, notably the United States, find indefinite refuge in Cuba, and, therefore, are attracted in unusual numbers to the island.

Second: Passage of a law forbidding Congress to grant pardons to criminals. Such amnesty even has been given to immigrant criminals from other countries.

Third: Investigation and immediate suppression of the traffic in women, both native and foreign, and the setting up of bars against these women from other countries.

Fourth: Immediate closing of the lottery, on both economic and moral grounds. It is charged that the corruption of officials of the national government has been accomplished by the graft incidental to the operation of this national gambling scheme.

Fifth: Repeal of the measure known as the "Tarafa Law," which creates a monopoly in railroads and in the control of the ports outside Havana which these lines reach.

Sixth: Passage of a constitutional amendment making the judiciary independent of all other branches of the national government, and especially eliminating all influence over the judiciary by the executive.

Seventh: Adoption of a system of public accounting which shall insure the honest disbursement of national funds, and providing suitable punishment for officials found to be violating this law.

Eighth: Complete rewriting of the Electoral Code, assuring fair elections, eliminating fraud in vote counts and providing punishment for officials convicted of violation of the new code.

Ninth: Passage of a law limiting the immunity given to members of congress so that such men, on indictment, may be brought to trial as soon as the session in which they are sitting comes to an end.

Tenth: Amendment to the constitution forbidding one man occupying the presidential chair two successive terms.

Eleventh: Elimination of gambling by refusal to grant renewals of gambling concessions now in force, so that eventually all games of chance will be forbidden.

Twelfth: Adoption of an amendment to the constitution granting the right of suffrage to women.

The leader of the veterans and patriots is Carlos Garcia Velez, son of the celebrated Calixto Garcia, to whom Lieutenant Rowan carried the famous "Message to Garcia," just prior to the declaration of war on Spain by the United States, twenty-five years ago. This Carlos Garcia—Velez being his mother's name—was inspector of prisons under General Leonard Wood when the latter was in charge of the American intervention in Cuba.

Turning Out One Hundred Per Centers

A University Program Which Builds Health Along With Mental Power

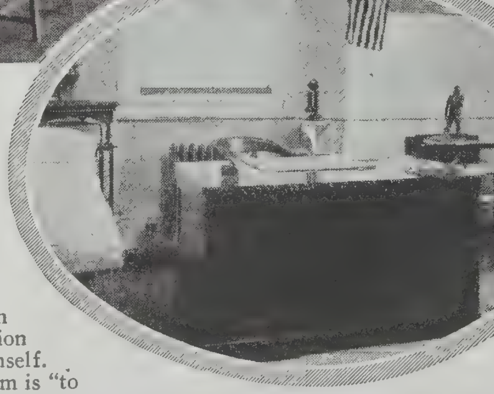
By J. OLIN HOWE

DR. WILLIAM H. M'CASTLINE

Earl Hall at Columbia, the university health headquarters.

Where nose and throat cases are cared for.

The waiting room at Earl Hall.



The office where Dr. McCastline sees thousands of patients during the college year.

"WE CAN'T all be Roosevelts," says Dr. McCastline, "but each of us can reach one hundred per cent if we live within the limits of our own physical endowment. University students are potential workers, destined for important places in business, in the professions and in politics. No effort is too great to train them physically as well as mentally.

"Time was when a puny, sickly body was deemed the natural accompaniment of a trained intellect, but that day is past. Today the man with a body below par is terribly handicapped in the race for success in any field of work. 'Tis a poor investment to place at a student's command all a modern university does unless at the same time we scientifically prepare his physical body to give him health and vigor sufficient to carry the weight of his responsibility as a trained man."

Yet nowhere else is this done in quite the same way, or possibly as fully, as at Columbia University in New York, where Dr. William H McCastline is university medical officer.

It is a wonderful thing to be, as he is, best friend to twenty-five thousand, mostly young and in their formative years, really to know them and to help them find themselves physically while gaining mental power and poise; especially when not a few come from the ends of the earth, and one needs be as familiar with beriberi and Bagdad boils, tropical fevers and hookworm as with "flu" and the ordinary American cold.

Physician and diplomat is Dr. McCastline, an unusual man in the work he has developed in novel ways, who for a decade has been making life better worth the living for a constantly widening circle of young men and women. The letters they write him, some of the fellows who graduated in his first classes, make it all well worth while.

The doctor on the university campus may have a formidable sound, yet here is one of the most human men alive, who has made his a very human job. There is far more to it than diagnosis and remedial treatment, skillful though he is in those. He even advises as to the field of work for which a student is best fitted physically. One with defective eyesight might fail as lawyer or physician but make a great success at something where that mattered less.

Before they enter Columbia, the medical officer must have reports on each student, which give him a far more intimate and complete knowledge of the students than deans, registrars or professors ever get. He helps them out of abnormal conditions, seeking always to eradicate actual disease and to correct the results of earlier errors, and treats them when they fall ill.

His records are a check against their scholarship records. In them is frequently found the reason for falling behind in class work and they expose the merely lazy or inattentive with unerring accuracy.

What is of utmost importance, the university health officer works with the physical education department in an original health program centering about compulsory credits in physical education in freshman and sophomore years. This even includes oversight of student diet in the University Commons, which has been taken over by the trustees with just this in view. Prophylactic measures are giving each Columbia class a better health record than the last.

This is not a group affair, however, not institutional, nor in any sense a clinic. It is directed entirely to the individual, despite the fact that 18,000 to 20,000 consultations and treatments each college year occupy the attention of the staff at Earl Hall, the main floor of which is given over to the health department.

Whatever has been and is being accomplished is a matter of the individual, and all mass results are built up from him. Moreover, while one of his assistants may see patients later on or a competent nurse give treatments, Dr. McCastline himself sees each on the first visit.

Such service could not be bought. Nor is it subject to the question of fees, which handicaps many a doctor. Unless they have a prescription filled at an outside drug store, Dr. McCastline's patients pay nothing, and he is free to see a student every day for a year if that seems the best way to seek out his weak points and acquaint him thoroughly with his own body.

To begin with, when a prospective freshman applies for admission to Columbia he must file with his application a health examination form filled out by himself. The purpose of this form is "to enable the university authorities to assist the student to maintain a high degree of efficiency by proper adjustment, as early as possible, to the mental, physical and social activities of college life."

Its questions cover whether the student is subject to sore throat, coughs, colds, and what illnesses he has had in the previous two years; whether he has had rheumatism, typhoid fever, malaria, is subject to fainting spells, has had to discontinue study for any period because of ill health, has been operated on, plans to do any work for self-support during his college course; and much similar information.

The whole gives a fair idea of the one who fills it out, but is only a beginning. At the same time the applicant's own physician files with Dr. McCastline a form on which he states in professional terms and in some detail the results of a thorough medical examination made the day it is dated. He adds any suggestions, from one doctor to another, he thinks desirable.

If either of these discloses a reason for it, before he finishes his registration—I am using the masculine pronoun, but this applies to both sexes—and, in any case soon after, the student must report at Earl Hall for a physical examination as thorough as Dr. McCastline and his staff know how to make it.

The furnishings of the medical officer's consultation room have been chosen to make it seem what it is, the office of a private physician, where stiffness and formality are not and one senses that helpful atmosphere which leads to confidence and confidences.

Annually thereafter while he remains at Columbia the student goes through such a physical examination. Such occasions may be the only times he visits Earl Hall, but always the health department is watching him. The results of these examinations are recorded in detail and tabulated to permit the health department to follow his bodily development and state of health from year to year.

The findings of the psychological tests which have replaced the old-style entrance examinations are filed with Dr. McCastline and the weekly scholarship records as well, so that he has but to turn to a file to find how the student progresses.

Each freshman is photographed, full length, to show posture and physical defects. Where postural defects are evident he is photographed again at stated intervals to show the results of corrective or special gymnastic work. The head of the physical education department is also a physician and the supervisor of the College Commons a trained nurse, from which one gathers a notion of the teamwork that goes on.

Should the student wish his own physician to handle the correction of disabilities, that is quite permissible; it is even encouraged in many a case; but if the examination shows work to be done to bring him up to physical par, he must have it done, by his own doctor or under the supervision of the university medical officer.

This applies even to surgical operations, which are always performed by specialists outside the university. Columbia is fortunate in having next door to the campus one of the leading hospitals in the East and of course there are the vast medical, surgical and hospital resources of New York City to draw upon.

The university, then, learns what shape the student is in when he enters, learns it searchingly and the whole of it, and helps him out of any physical difficulty that can be remedied. The plan is simple enough, and the way it is carried out makes it most effective.

Columbia conceives it a plain duty not only to maintain student efficiency through the best health of which each individual is capable while in the institution, but to create a regard for health which its graduates will cherish as a precious part of their university experience and which will lead them to live up to the same standards through life.

The importance of that cannot be overstated. We Americans are very far from a hundred per cent healthwise. The story of an entering class of Columbia College is illuminating.

Of 802 freshmen, about one hundred had throat, nose or ear diseases and abnormalities. Only one per cent had pulmonary diseases. Thirty-three had heart affections. Two hundred and one showed defective vision corrected by glasses and eleven more had eyestrain which required correction.

There were thirty-two subject to headaches and 274 had had surgical operations. More than one-third! Thirty had had typhoid fever and 166 had been immunized from typhoid, and 600 had been successfully vaccinated. Seventy-one of these entering students had been obliged to discontinue their studies or had had limits placed on physical exercise because of ill health.

Improper dental conditions Dr. McCastline finds a most prolific source of trouble. His staff includes no dentists now, but it soon will if he has his way. "Numbers of students," he says, "have permitted their teeth to go so long without proper care that these have become a distinct menace to their health."

Of this 18,000 to 20,000 consultations Earl Hall handles each year, about two-thirds are with men and

Measure Rivers to Aid Industrial Development

Uncle Sam's Workers Collect Data by Means of Current Meter

By S. R. WINTERS

INSTEAD of riding in an automobile or trolley car to and from work, suppose your duties were restricted to a box-like car suspended on a cable above a stream or river! Field representatives of the Geological Survey, United States Department of Interior, often may be seen hanging above streams pulling themselves along a cable suspended across the river and fastened to supports on the banks.

This representative of Uncle Sam is, more than likely, an engineer, and he suspends himself over a stream to measure the volume of water carried at different stages. By means of the data collected, the Geological Survey computes the daily flow of streams at approximately 1,600 points. These investigations, made at gauging stations, are conducted in about thirty-five states and in seventy-seven points in Hawaii.

A poet of the sixteenth century gave us the dictum, "Where the stream runneth smoothest the water is deepest." This bit doubtless sufficed for the generation in which it was written. In the twentieth century, however, when water is being harnessed for power, irrigation and navigation, specific information is demanded. For instance, if water is to be harnessed for power accurate data are demanded relating to the minimum flow of water. If, however, water is to be stored for irrigation, as in the West, the greatest volume of water is information sought.

Development of water resources is dependent largely upon the dependability of records relating to the flow of surface waters and conditions governing this flow.

"This country is just realizing that water is the one limiting factor to the development of our natural resources," declares N. C. Grover, chief hydraulic engineer of the Geological Survey, United States Department of Interior.

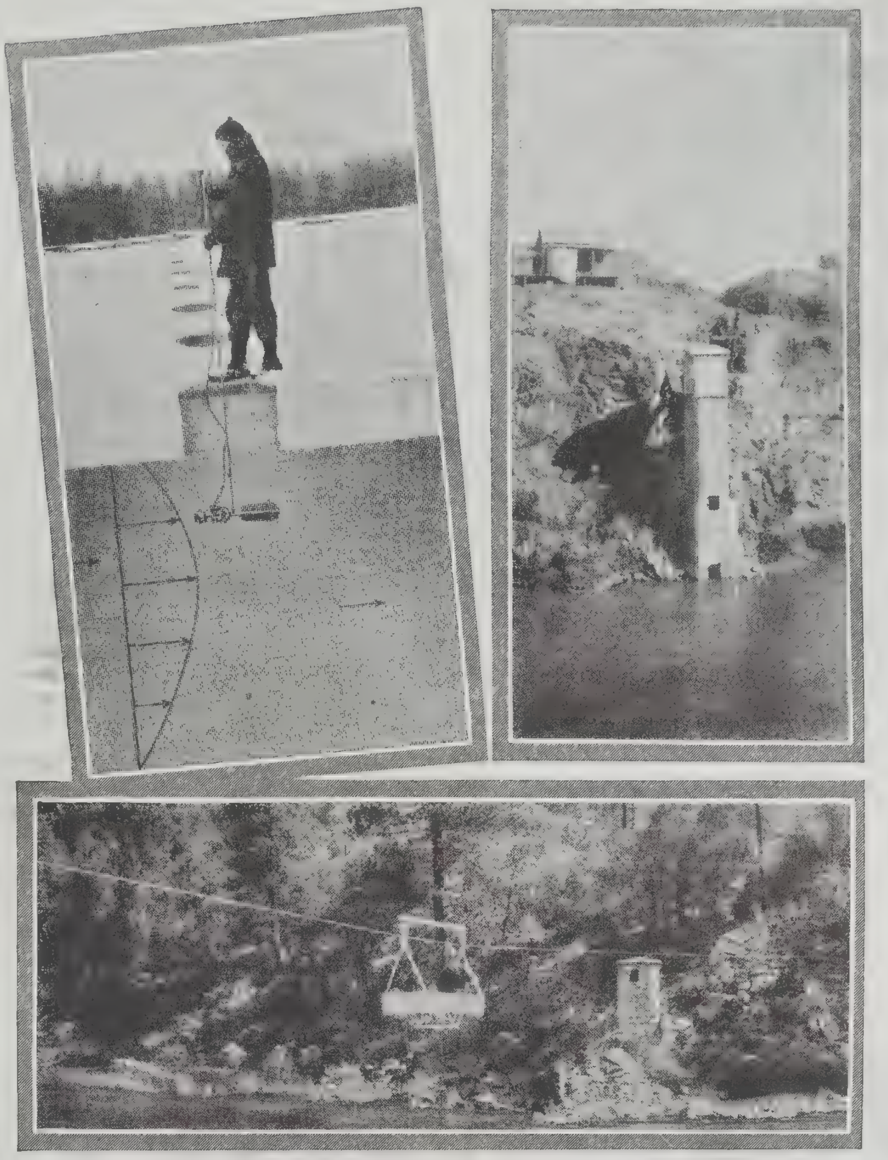
The first gauging station—a point for measuring the flow of water of a stream—was established at Embudo, New Mexico, in 1888. It was not until six years later—on August 18, 1894—that Congress made a specific appropriation of $12,500 "for gauging the streams and determining the water supply of the United States, including the investigation of underground currents and artesian wells in the arid and semi-arid sections." For 1923, an appropriation of $180,000 was made.

The largest number of stream-gauging stations is maintained in Idaho—236 in 1922—where irrigation projects demand information on the maximum flow of water over long periods of time. California ranks second, maintaining 193 stations. New stations are constantly being established and old ones discontinued—for instance, last year 258 gauging stations were abandoned and 444 new ones established. The number of gaugings taken last year was 11,383, all told.

The current meter for measuring the flow of water employs a wheel, so built that the pressure from flowing water causes it to revolve. A device records the revolutions. There are two types of current meters—one in which the wheel is made up of cups, the other with a screw propeller. The velocity-area method is used to ascertain the quantity of water flowing past a certain section of a river within a specified time. This is termed a "discharge measurement." The gauging station is usually located where there are no cross currents, backwater, or eddies; where the bed of the stream is free from large projections of a permanent character, and where the banks are high and subject to overflow.

The cable on which the car used by the engineers is suspended may vary from 100 to 1,000 feet. Ordinarily, the track consists of a single steel cable, three-fourths to one inch in diameter. This is supported by towers on either bank. The car in which the hydrographer rides causes the cable to sag and as he pulls himself along the tug is increasingly difficult as he nears the end. There are other ways to use the current-meter, measuring from a bridge, boat, or by wading.

The data assembled at the nineteen district offices, as the information comes from gauging stations, are forwarded to Washington, where the statistics are reviewed and prepared for publication. Practically all development of water power is based on these records. If one is contemplating the building of a huge dam he should consult the division of surface water of the Geological Survey with regard to the maximum flow of water in the stream where the reservoir is to be constructed. Similarly, if one is planning to establish a hydroelectric plant, it is desirable that the enterprise first have specific information about the minimum flow of water. These records, taken at frequent intervals, are an invaluable guide in charting any developmental project.



Directly above—How a representative of the Geological Survey suspends himself across a stream by a cable. Top, left—Measuring under ice from a dam. Right—In remote places the observer has a house. The hut seen in the picture is on the Colorado River.

When David L. Payne Led the Boomers

Concluded from page 9

But the War Department smartly thought of posting troops on the line where they were gathering, and this held the poor settlers in camp until the sufferings caused by an unusually severe winter forced them to give up and disperse in January. A few of Payne's followers remained with him, however, and he himself did not lose heart. His robust physique was still capable of much endurance, though his army life had left him subject to malaria and rheumatism.

Meanwhile a civil suit had been brought against Payne in the name of the United States for $1,000 damages for invasion of an Indian reservation. The government won judgment against him, but as he had no personal property, the money could not be collected.

So Payne went blithely on, constantly forming new colonies, leading them into Oklahoma, first at one point and then at another, and putting the army to all kinds of trouble and inconvenience to chase him out again. The thing got to be such an annoyance to General John Pope and others whose duty it was to eject him each time, that they grew to hate him with a personal rancor. The soldiers shared the resentment of the officers. Accordingly, Payne's treatment at the hands of the military was harsh, and his lieutenants and followers, even the women and the aged, sometimes shared this usage. Petitions to the government set forth that some of them died of it. The diaries and letters of Payne and his colonists reveal in an affecting way the hardships and sufferings they endured in those terrible trips to Fort Reno.

Payne writes of these things to his common-law wife, Mrs. Rachel Anne Haines, in Hunnewell, Kansas, and to their little son, George, for whom he seems to have had the tenderest affection, although he signed himself to the latter, "Uncle George." One letter was written on his knee when he and several companions were prisoners in the army camp opposite Fort Smith.

"Tomorrow will be five days they have kept us here without room to sit down. I've been cramped up so long my legs are almost useless. I want a breath of fresh air. It's burning hot in this little tent, but I can't stick my head out without a cocked gun in my face. I never did suffer so, as many times as they have had me. They have done their best to kill us all this time without doing it straight out."

And again he tells his "dear boy, George" of the painful ride over the prairie in the springless wagon, crowded with men, most of them sick from the burning sun, the scanty diet of bread, bacon and coffee, and the rough handling of the Negro guards. Payne's rheumatism is very bad, but his compassion for the old men of the party makes him feel especially helpless.

A letter to Captain Payne from one of his settlers bears pathetic witness also:

"Dere Sir I had offel bad luck. I went to Okley homey and lost my wife by the cas of it also the solgiers beat 2 of my horses one died and the other one lived and it leaves me with six small children and the oldest one onley 11 years the yungest three years I am sad and lonley I hope to hear from you soon."

Payne made no fewer than eight attempts to colonize Oklahoma. About twice a year he gathered his boomers about him on the border line, and led them across, and each time they were expelled by the troops and Payne was arrested. But in one of his diaries there is evidence that on at least one other occasion, unreported by historians, he invaded the territory and actually lived a month in his dugout, without the authorities being aware of it.

His chief anxiety all this time was that he could not get a real test of his contentions in the courts. Every time he was arrested, the charges against him were postponed and finally dismissed. He tried to force the issue by bringing suit in the United States court at Topeka against General Pope for damages for being forcibly removed from the territory. But the only real victory he ever won out of his numerous cases came when he was arrested and indicted in 1883 on the charge of conspiracy to violate the laws of the United States. The indictment was quashed on the ground that the title to the Oklahoma lands was vested in the United States and that therefore settlement upon the same by citizens of the United States was not a criminal offense. But this did not prevent his being ejected as usual when he went at the head of another colony to Oklahoma again.

He felt, and his followers implicitly believed, that the head and front of the opposition to him was organized and backed by the cattlemen and the big interests.

To combat the cattlemen with their own weapons, Payne started a newspaper of his own, the Oklahoma *War Chief,* which was the official organ of the colony, until some years after his death. On his last and greatest expedition in the summer of 1884, when he led a large band to Rock Falls in the Cherokee "Strip," he took along his printing press and set up an office for the *War Chief* in the midst of the little town of tents and dugouts. This colony lasted longer than the others, several months, in fact, but in August Colonel Edward Hatch appeared and ordered the colonists back across the border to Kansas. The printing press was wrecked and thrown into the river. Payne once more was under arrest.

No sooner was he released than he began to gather his forces for another attempt in the autumn. One night he lectured at Wellington, Kansas, and the next morning, as he sat at breakfast at the hotel, he suddenly fell to the floor, dead. This was in November, 1884. As he had been apparently in the best of health and spirits at the time, his friends suspected foul play and claimed that he had been poisoned. He had the largest funeral ever held in that small town.

And so he passed into history, but his influence and his persistence had accomplished their purpose, and the leaders upon whom his mantle fell found their task miraculously eased by the great support of public opinion which Payne had won. In April, 1889, the territory was opened, and the struggle ended. The spot where, forty-three years ago, Payne's first Oklahoma colonists unhitched their horses and began to choose their homes, now is a part of Oklahoma City, the capital of the state, a growing metropolis and the center of a large and thriving commonwealth, such as perhaps even Payne's vision of the promised land did not encompass.

From Prize Ring to Pulpit

Refereeing Bouts, Supervising Dance Halls and Preaching All in a Day's Work for This Parson

By FRANK M. CHASE

THE minister of the First Christian Church of Chanute, Kansas, was working in his study one Friday evening a few weeks ago when the telephone rang. It was a long-distance call, the promoter of a boxing bout in Wichita desiring to obtain his services as referee the following evening.

"I'd be glad to help you out," the minister said, "but my first duty is as a preacher and there is no train that will bring me back in time for church Sunday morning."

"Will you come if we guarantee to get you back in time for church?"

"That's a bargain," replied the preacher, who journeyed to Wichita the next day and officiated at the match. Then, instead of riding in a motor car the remainder of the night, as he had half expected he would, he went to bed in the city's best hotel. At 7 a. m. he arose, had his morning coffee, and was taken to the landing field just outside the city. At 9:58, after having traveled 135 miles through the air in less than two hours, he was standing before his Sunday school class, conducting his services as usual. "Preacher Flies From Prize Ring to Pulpit," ran the headline of Monday's newspaper account of the incident.

In the life of the Rev. Mr. Earl Blackman, known from his boxing activities as the "fighting parson," neither hurried airplane trips nor prize fights are unusual. To use his own expressive term, he "eats" them. Paradoxical as it may seem, the latter have an important place in his ministerial work. He is even teaching the boys of his Sunday school class to box, and the only reason that amateur bouts are not held in his church is that it is not equipped for athletics.

Why He Urges Boxing

"AS A preacher, I heartily recommend boxing," he said, as we utilized a 40-mile motor trip for our interview. "It is not only good exercise but excellent training for both muscle and brain. Through its development of good sportsmanship it also has a desirable moral effect. There are four essentials to good boxing. These are to know how to hit, how to be hit, how to prevent the other fellow from hitting you, and how to outguess the other fellow. The first three are purely instinctive, being matters of self-preservation, and are the only ones that most boxers consider. All the fine points of the game are in the fourth essential, which calls for the exercise of the mental faculties.

"So far as my own participation in boxing is concerned, I welcome the opportunity it gives me to keep in touch with different kinds of people, many of whom are seldom, if ever, reached by the church. I believe that I am a better preacher because of this variety of contacts. It also gives me an opportunity to promote clean play, as I tolerate no unfairness where I am referee."

Blackman's interest in boxing dates from his boyhood, when he was a frequent loser in his juvenile altercations. After a time his father tired of hearing the tearful reports of his son's squabbles and encouraged him to fight back. The young Blackman was naturally quick in both thought and movement and, having overcome his timidity, began to hold his own. As his proficiency with his fists increased he even came to enjoy the encounters with his fellows. Thereafter he took advantage of every opportunity to box and to learn more about the game, pursuing it in high school and college and wherever fortune took him. During his service as chaplain with the over-sea forces he not only boxed but was in large demand as a referee. Since his return to the United States these calls have continued, scarcely a week passing that he does not officiate at a bout, often at a considerable distance from home.

"Though I have done some professional boxing," he said, "I do not attempt it now. I must admit that I am not quite so fast as I used to be. My aim now is to do only enough boxing to keep myself in good condition and able to step out and go three or four rounds at any time. I know of nothing better than boxing to keep a man young." Of the truth in the last statement Blackman is a good example, for, despite his 40 years, there is nothing in his lithe and vigorous manner to indicate that he is beyond the early 30's.

He was born on a farm near Lisbon, Indiana, and has made his own way in the world since he was 14. At 19, with $40 in his pocket and a desire to attend Pratt Institute, he went to New York. Going with youth's dream of a hearty welcome by the city, he received its usual rebuffs. After a number of anxious days he obtained employment as a fireman on the elevated railway, and started to school. Bettering his position, he later worked as an engineer's assistant on a steam yacht. After attending the institute two years he returned to Indiana, where he held several positions as stationary engineer. He then decided to obtain some more education and commenced a college course. Disappointed in a love affair, he suddenly abandoned his studies in his senior year, and, wishing to sever old ties in heroic fashion, vowed he would ride his bicycle a thousand miles. At the end of the thousand-mile ride he found himself in Central Kansas, where he obtained employment in the wheat fields. Here he ran a threshing engine, and later sold motor cars. While thus engaged he married a Salina, Kansas, girl, and with the settling-down process came the desire to preach.

Though Blackman had been reared in the Christian (Disciples of Christ) faith, he felt that his church was suffering from a restricted vision and not utilizing its opportunities. To demonstrate, or at least try out, some modern ideas became his burning desire. Fortunately for him, while the Christian church is bound by much tradition, there are no restraints on its preachers except those exercised by their respective congregations. Blackman and his wife moved to the University of Kansas, where he studied two years, specializing in sociology. During his second year at the university he preached for the First Christian Church of Chanute, then becoming its full-time pastor.

The "fighting parson" (REV. EARL A. BLACKMAN, Chanute, Kansas) in battle array.

Having chosen an unorthodox path, Blackman did not expect to find it easy. Differences developed, not only within the church but among his neighboring Christian ministers, only a few remaining friendly. However, he had been preaching about four years with no open break occurring. Then came the World War, Blackman joining the colors as chaplain of the 130th Field Artillery, 35th Division, with which he continued until it was disbanded in the summer of 1919. Meanwhile his enemies at home had been at work. He had scarcely returned to Chanute before he was keenly aware of the schism they had created in his church.

Blackman did not dally with the new situation a moment. The war had confirmed his belief in the fundamentals of religion more firmly than ever, but had made him less mindful of creed. It had also increased his confidence in his own course of action. Plainly the time for a complete show-down by both the pastor and the congregation was at hand, and in his second sermon after returning he forced the issue.

Makes Dances Clean Up

HE REITERATED, more strongly than ever, his belief that modern conditions must be met with modern church methods. He declared that he favored supervised dancing, motion pictures, boxing and other disputed forms of amusement. Following Blackman's declaration in favor of dancing, Chanute's interest in the pastime measurably increased. The patronage of the city's leading dance hall, for example, virtually doubled. Now, the standards of this hall were not higher than the average. Here was a logical place for reform to begin. Blackman did not, however, invoke the law. Instead he went to the manager of the hall, saying, in effect:

"Look here, I've doubled your business. Now I want you to clean up. I want you to have big dances, but I want them clean. I want you to provide more seats for the girls between dances and for their parents. I want the fathers and mothers to feel that they are as welcome here as their sons and daughters."

Despite unpopularity among his brother ministers, and despite foes in his own church, Blackman has remained a large factor in the civic life of Chanute. As evidence of the esteem in which he is held locally, the citizens presented him, on his election as national chaplain of the American Legion, with a motor car.

"Expression, directed and controlled, instead of repression—that is the essence of my ministerial policy," he said, in summing up his views. "Christ said, 'I came that ye might have life, and that ye might have it more abundantly,' and so I believe in preaching the gospel of 'do,' not 'don't.'"

Turning Out One Hundred Per Centers

Concluded from page 12

one-third with women; but at Barnard, the university's women's college, there is an auxiliary medical center where upward of 7,000 consultations a year are added to the feminine record.

Among actual cases of illness treated at the bedside, an essential feature of the department's work, far more—oh, six or seven times as many—are women than men. Women students congregate in groups to a greater extent than men and contagion has a better chance to spread.

Tonsillitis, grippe, coryzas and throat troubles form the bulk of these active medical cases. During the last college year thirty-three patients were sent to outside hospitals through the Columbia infirmary. Eight cases of appendicitis showed up. Not an alarming record, surely.

Though it is really another story, the time is not far off when Columbia will have one of the finest hospital plants in the country as a feature of a medical foundation centering about its College of Physicians and Surgeons. This is a $22,000,000 project and most of the money has been raised. A million of this will be spent on infirmary facilities on the campus, but there is no room on Morningside Heights for the group of buildings to house this medical center, which will be located farther north on Manhattan Island.

Health Board a Factor

COLUMBIA'S health department is as fully at the command of faculty members, and of attachés of the university, as of the students. What Dr. McCastline has come to mean to professors and their families, and even to janitors and scrub women, is worth all the effort.

Another feature of this work is the students' health board, which from the beginning has been a means of keeping in touch with matters affecting student health which might be overlooked by the medical staff; at least, that is the modest way of the university health officer's putting it. I doubt if he overlooks much that is pertinent to his work.

But the student health board is a valuable factor in the work of his department. Its members are appointed by Dr. McCastline and as far as possible he sees to it that each school in the university is represented. It is constantly active, is regularly consulted and seconds his efforts in every way it can.

This sort of thing has been going on at Columbia since the spring of 1912. Before that, oversight of the health of the students had been left to the physical education department, as it is still in many another college and university. Physicians in that department treated emergency cases on the athletic field and in the gymnasium, but there was no real health program until Dr. McCastline came to devote himself to students' individual health problems.

Must be Diplomat, Too

BY REASON of its location in New York City, Columbia's student body, the largest in America, anyway, is highly cosmopolitan and polyglot, but that by no means tells all the story. The university draws heavily on our southern and southwestern states and its students come from many far corners of the globe—from Australia and New Zealand, from South Africa and South America and especially from China and the Orient.

It is by reason of that fact that the university medical officer must be diplomat as well as doctor; and he is, this big-hearted servant of student humanity. No matter how far he be from home and though but a single atom in a great whole, any student may get on all right while he is well. To the foreign student it is not so difficult, even though he does not abandon caste or class distinctions merely because he matriculates at an American university.

But let him fall ill in a strange land and amid unfamiliar surroundings, and a real problem exists. To him, then, at least for the time being, Dr. McCastline is the university. Can anything be more important than that the forty-five-year-old Chinaman stricken with "flu" be handled just right when he sidles hesitatingly into Earl Hall, hardly able to see for the splitting headache or to speak for the cough which racks him?

This man actually took off his shoes in the corridor and entered the doctor's office in his stockinged feet, as he would have done at home. Such a one knows little of western medical practice; perhaps nothing. It is a chamber of horrors to him, into which he is entering, driven by the conviction that he must be very ill.

Mrs. McCastline is a doctor of medicine, also, and in charge of important health work at the Horace Mann school, which is affiliated with Columbia; so in the evening the university doctor can talk shop to one who understands, if he will, and his friends say he often does.

President, Ramsey Institute of Technology, St. Paul, Minnesota.

The Interior Constitution of the Earth and the Moon

THE great American pragmatist, Professor William James, held that *truth is that which works.* It has a cash value in terms of satisfactory experience. Dr. Melchior Palagyi, the great Hungarian philosopher and scientist, in a polemical brochure, has exposed the weakness of the pragmatic position. In America, Dr. Paul Carus did much to counteract the erroneous views of the pragmatists in his great work, "Truth on Trial." The views of Dr. Carus are summarized in his statement: "Truths are the subjective reflections of the verities that sustain the universe." Scientific knowledge is based upon the fundamental premise that the objects of scientific investigations are actual cosmic verities and not merely that which *may work* satisfactorily for a limited time. Primitive man left us a heritage of truth blended with error. Superstition remained as a by-product of inexact observations of the verities which are revealed in all physical action. At the present time there are many persons who retain the mythological representations of former eras concerning the constitution of the earth's interior.

Precision instruments have extended our field of accurate observation and have thereby replaced mythology by definite or scientific knowledge. The seismograph has played an important rôle in research work dealing with the structure of the earth. E. Wiechert and Marvin have brought this instrument to a high state of perfection. Marvin's type of seismograph is used by the United States Weather Bureau. A complete seismograph records horizontal and vertical motion and also time. Both the Wiechert and the Marvin instruments are of the inverted pendulum type. Some of the best forms of seismographs are in use in the Imperial Observatory at Tokyo, Japan, where they have been employed in the study of earthquakes.

The careful research work of the great geophysicist, meteorologist, and mathematician, Professor Stjepan Mohorovicic, of Zagreb, Jugo-Slavia, has been an important factor in enlarging our exact knowledge concerning the material structure of both the earth and the moon. Dr. Mohorovicic's most recent contribution, entitled "The Interior of the Earth," will soon be available in the German language. Some of Dr. Mohorovicic's most important conclusions will be briefly considered in this article.

In his preliminary historical outline, Dr. Mohorovicic points out the fact that Pythagoras, about twenty-five centuries ago, taught that our earth was of a spherical form. Eudoxes and Archimedes were among the first who attempted to prove the correctness of this conclusion of Pythagoras. Descartes and Leibnitz held that the interior of the earth was composed of a glowing-liquid mass. Laplace, by means of his nebular hypothesis, tried to substantiate this supposition. Many geologists still adhere to the hypothesis of Descartes and Leibnitz. One of the modern reasons advanced, in support of this view, is that the earth's temperature increases about one degree Celsius for every thirty meters of additional depth. Hot springs, volcanoes, and the similarity of the expelled lava are other factors which are presented as evidence proving the hypothesis of a molten interior. The earth's outer crust, or *lithosphere,* was considered as having produced mountains and continents by expansion and oceans by contraction.

Lord Kelvin and G. H. Darwin were among the first of the modern scientists to show that the phenomenon of the tides would be impossible under the supposition of a thin *lithosphere.* If the earth's crust was comparatively thin, and served to incase a liquid mass, then the ocean tides would fail to appear because this interior liquid substance would also act in a tidal manner. On the contrary, Kelvin and Darwin found that the earth, considered in its totality, must be regarded as composed of material aggregates whose average rigidity is greater than that of steel. This view has been confirmed by the most recent careful investigations of O. Hecker, W. Schweydar, and E. Wiechert. Hopkins investigated the effect of the state of the earth's interior material on the phenomena of *precession* and *nutation.* Precession is a slow change in the direction of the earth's axis. The small oscillation of the earth's axis is called nutation. He found that these two phenomena depended, in amount, upon the comparative thickness of the *lithosphere* and also upon the relative plasticity of the interior material.

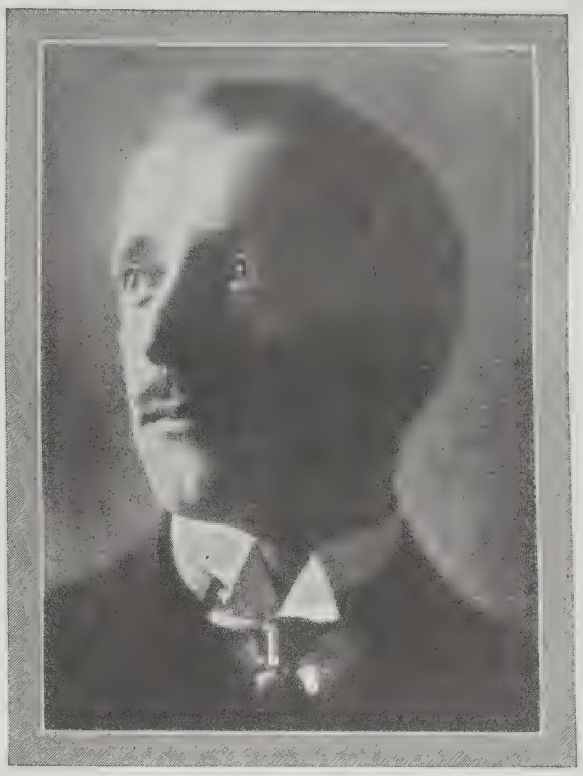
The most recent seismographic investigations have proved conclusively that the earth consists of concentric layers composed of the same general type of material, at least through a depth of 3,000 kilometers. This definite advance in our knowledge of the nature of the earth's interior is due principally to the precise observations of Stjepan Mohorovicic, of Zagreb; E. Wiechert and K. Zoppritz, of Gottingen; G. B. Rizzo, of Catania; A. Mohorovicic, of Zagreb; and B. Gutenberg, of Darmstadt. The remarkable research work of these illustrious modern scientists, taken in conjunction with the important findings of L. Geiger, C. G. Knott, J. Milne, H. Benndorf and V. Laska, shows that the earth's material exists in a solid state to a depth of *at least* 2,500 kilometers and in fairly well-defined layers. A. Mohorovicic has shown that the outer layer is about sixty kilometers thick. This result has been definitely confirmed by the investigations of Dr. Jose Comas Sola, director of the "Observatorio Fabra," Barcelona, Spain.

Professor Stjepan Mohorovicic, by means of a series of elaborate and extremely careful investigations, has recently determined that our earth is composed of three principal layers of material as depicted in his drawing, which is here reproduced. This notable precise work enables us to state definitely that the solid outer layer, *A,* whose thickness is about sixty kilometers, consists principally of granite, syenite, diorite, and porphyry. The average density (or specific gravity in terms of water as the standard) of the outer layer, *A,* according to the findings of S. Mohorovicic, is 2.6. He has also shown that the middle layer, *B,* having a radial thickness of about 2,900 kilometers and an average density of 4.8, is composed principally of a rock-like material which is rich in iron in those portions which are nearer the earth's center. Moreover, Dr. Mohorovicic concludes, from his experimental observations, that the radial thickness of the inner layer *C* is about 3,400 kilometers and that its average density is about 11.0. Mohorovicic's findings indicate that the layer *C* is very rich in iron. He gives the average rigidity of the earth as about three times that of steel.

In the year 1907, Dr. W. H. Pickering advanced the hypothesis that the moon was composed of matter dissociated from the outer layer of the earth. The conclusions of Pickering were based upon the assumption that the continents compose about one-quarter of the earth's surface. The recent careful calculations of H. Ebert show that Dr. Pickering underestimated the relative value of the continent surface.

Professor Mohorovicic holds that the process by which the moon was detached from the earth required many millions of years. He finds that the material constituting the moon is composed not only of matter detached from the earth's outer layer, *A,* but also of a comparatively small amount of that more dense material which composes the interior portion beneath this layer. Mohorovicic finds that the moon is composed of an outer layer *A* of about 400 kilometers thickness and an inner layer *B* of an average thickness of 1,340 kilometers. He gives the density of the outer layer as 2.7, and the value of 4.7 for the inner.

Superstition must give way before the truths revealed by the precise methods of modern scientific research



PROFESSOR STJEPAN MOHOROVICIC,

The illustrious Jugo-Slavian scientist and mathematician, whose notable researches in geophysics and meteorology have received world-wide recognition and whose unique solutions of Euler's Hydrodynamical Equations distinguish him as one of Europe's most brilliant mathematicians.

BRIEFLY TOLD

A speed of 105 miles an hour has been attained by an electric locomotive in tests before 200 steam and electrical railroad men from all parts of the country at Erie, Pennsylvania. An electric locomotive and a big Mikado steam locomotive engaged in a tug of war. The electric proved superior in pulling after giving the steam engine a start at five miles an hour.

An enterprising American is preparing to put a fleet of 500 yellow taxicabs on the streets of London, England. All the cars will be of the four-cylinder type and comfortable.

A rare apple tree, valued at $5,000, stands on a mountain side in West Virginia. It is protected by a burglar-alarm cage and is guarded against harmful insects and foraging animals.

More than $3,000,000,000 have been spent by American railroads this year for materials, fuel, supplies and maintenance of equipment.

The petrified body of a miner was found in a salt mine near Bucharest. A mine lamp found on the body was of so old a type that even the oldest living miners had never seen one.

Bodies of more than 100 German soldiers, postured in lifelike attitudes, have been found in a tunnel between Bethincourt and Dead Man's Hill. They were bottling mineral water when stricken in a gas attack during the battle of Verdun.

What is believed to be America's first apartment house was built in New Orleans by the Baroness Pontalba, daughter of the Spanish governor of Louisiana. Sixteen of these apartment houses were erected in 1846, a row of them on either side of the City Plaza.

Artificial silk is being made from spruce wood.

A flash of lightning struck the earth near the foot of a tree in Madison County, Illinois, in 1807, setting it afire. The monks of La Trappe dug below the fire and found a vein of coal, the first in the Northwest Territory.

Wild horses in the vicinity of Bend, Oregon, have increased so rapidly that they are becoming a nuisance. Extremely low prices for horses resulted in the ranchers turning them out into the mountains to shift for themselves.

The Imaja palm, growing in South America, has leaves reaching a length of fifty feet and are often ten feet wide. Another palm, a native of Ceylon, has leaves twenty feet long and eighteen feet broad, from which the natives make tents and shelters.

The Wayside Inn's neighborhood has been marked by the Census Bureau as the center of population for Massachusetts. The exact point is eight-tenths of a mile south-southwest of the Sudbury post office.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

"If the world's chemists and the world's engineers would hold annual meetings in a friendly spirit, for the salvation of mankind! If they could agree together that to exercise their ingenuity on the perfecting of destructive agents for the use of governments was a crime; to take money for it a betrayal of their species! If we could have such exchange of international thought as that, then indeed we might hear the rustle of salvation's wings. And—after all—why not?"—*John Galsworthy.*

The Maruhachi family, of Tokyo, who operated a drug house of old established fame, had received and transmitted from generation to generation a sealed instrument, with instructions that it should be opened only if the family house fell into straitened circumstances. The packet was rescued during the earthquake and it was found to contain instructions to dig at a certain place. Three earthenware pots of kobangs—oval-shaped gold coins of feudal days—were found, valued at several hundred thousand yen.

Gold was first hammered between parchment leaves until the mold, termed goldbeaters' skin, was invented. This skin is made from a membrane of the ox and the secret of its making is kept by a family in London which has made the membrane for three generations. Three months are consumed in the treatment of the membrane and it may be beaten continuously for months with a sixteen-pound hammer without material injury.

New local emergency paper money, based on rye values, issued by the Agrarian Union in Pomerania, has printed on its face the words, *"Not valid in Jewish hands."*

Sweden expects to electrify all of its railway lines within ten years.

"A Hearse Is a Poor Vehicle to Come to Church In—Why Wait?" This sign on the bulletin board of the Saint Andrews United Brethren Church of Des Moines started the congregation talking—and going to church.

"There are many people who can only do a particular thing on condition that they do it in two directions. They can repress themselves only when they are engaged in repressing someone else; for the thing we are doing outwardly and to others is always the thing that we are doing inwardly and to ourselves. If we treat others benevolently we are assuredly being kind to ourselves; if we mete out torment we will receive that measure and will write in it."—*James Stephens* in "Deirdre."

"Dixie," the popular Southern song, was written by a Northern actor, the theme, "I wish I was in Dixie" being the actor's desire for a winter engagement in the South.

Under the new American law, a woman not an American citizen marrying an American since September, 1922, does not obtain American citizenship thereby. She must establish a year's residence in the United States with due formalities. She may enter America, either accompanied by her husband or not, only as an ordinary immigrant depending on the quota rule.

The supply officers of the United States Army make annual expenditures of public funds mounting to many millions of dollars in times of peace and billions in time of war. That they may perform this important service with the greatest efficiency an Army School of Business has been proposed by the Assistant Secretary of War, Colonel Dwight F. Davis.

Two hundred and ninety-eight vessels of the American Merchant Marine were lost during the year, 139 were sold to alien flags, and 628 were abandoned, their tonnage being: lost, 127,584; sold, 218,401; abandoned, 142,916.

Prominent Masons of Lexington, Kentucky, launched a movement to preserve "Ashland," the home of Henry Clay, when they presented a resolution to the Grand Lodge of Kentucky, petitioning the state legislature for an appropriation to purchase the property. Kentucky Masons pledged $5,000 toward the purchase of this historic spot.

The Department of the Interior announces that more than 100,000 acres of public lands in the states of Colorado, New Mexico, Nevada, Utah and Wyoming will be opened to homesteaders. World War veterans are to have a ninety-one day preference in filing on the lands.

Turning the Searchlight on Life Insurance

Billion and Half in Premiums Paid in Year; Where Does Big Money Go?

PROBABLY there is no subject upon which the general public is so hazy as upon that of insurance in general, and life insurance in particular. Dr. S. S. Huebner, professor in the Wharton School of Finance at the University of Pennsylvania, remarks in a lately published textbook on insurance:

"Despite the almost universal use of life insurance and its vital importance to those who purchase it, very few persons take a direct interest in acquainting themselves with the management and business policy of the company in which they are insured. In practically all cases the companies are controlled by a limited number of persons, who have little or no difficulty in securing the necessary proxies to perpetuate their control. Even assuming that any considerable portion of the vast number of policyholders could be induced to take an interest in the condition of the company in which they are insured, it is clear that very few are sufficiently posted in life insurance matters to ascertain intelligently the true state of affairs.

"Life insurance is necessarily a technical and complicated subject, and the real condition of a company can only be determined by laborious and expert examination. In view of conditions like those just recounted, it will readily be admitted that life insurance is a fit subject for some sort of government regulation designed to protect the public adequately against mismanagement and unjust practices." (pp. 355-356)

The origins of the life insurance business go back as far as 1699, when there was formed in London a "Society of Assurance for Widows and Orphans." The growth of the business was so slow, however, that one hundred years later, at the beginning of the nineteenth century, it is estimated that there were not more than one hundred life insurance policies in force in the United States.

Do You Know These Facts?

BY 1860 the insurance companies doing business in the state of New York reported only 56,000 policies and an annual premium income of $4,700,000. It was after the Civil War that life insurance entered upon its great growth. In 1870 the number of policies reported by the New York companies was 740,000, with an annual premium income of $90,000,000.

Let us now glance at the status of the life insurance business in the United States today.

Do you know that life insurance leads all other forms of business or investment in the United States today?

Do you know that in January, 1923, according to the official Insurance Year Book for 1923-24, the total amount of life insurance in force in this country, as reported by 260 companies, was MORE THAN FIFTY BILLIONS OF DOLLARS—more than twice the amount of the national debt? ($50,028,063,373, of which $41,374,944,876 was ordinary life business and $8,653,118,497 industrial.)

Do you know that the amount of life insurance in force has doubled in only eight years?

Do you know that the assets of life insurance companies exceed the combined resources of the savings banks of the United States?

Do you know that the grand total of new business during the year 1922 amounted to NINE AND ONE-HALF BILLIONS OF DOLLARS, an increase of NEARLY ONE BILLION over 1921?

Do you know that in January, 1923, there were in round numbers 18,500,000 ordinary life policies in force, and millions more of industrials.

Do you know that the official Insurance Year Book states that the amount of annual premiums paid in 1922 to 260 life insurance companies was $1,672,099,924, that the total income of these companies during that year (premium payments, interest on investments, and so forth) was $2,137,294,355, while total payments to policyholders during the year amounted to only $1,006,931,734, leaving a difference between income and payments to policyholders, to the amount of MORE THAN ONE BILLION DOLLARS ($1,130,362,621)?

Do you know where all of this money went?

Do you know that the combined "admitted assets" of these 260 companies amounted in 1922 to MORE THAN EIGHT BILLIONS OF DOLLARS ($8,717,758,247)?

Where the Money Comes

THE question here naturally suggesting itself is, whence come these stupendous funds in the hands of the life insurance companies? The answer is, from millions of small payments, painfully scraped together by the policyholders. It is these which have built up the great reserves and which every year unite to swell the vast streams of income pouring into the insurance companies' coffers.

As Dr. Huebner suggests, there has been little real analysis of the fundamental facts of life insurance by the public. For instance, when a policyholder dies, who is it that really pays the money to his survivors? The insurance company, as nine out of ten might answer? Not at all. The insurance company is a mere trustee or agent. The money has been earned by the great family of policyholders.

Yet for years the public has been fed up on advertisements which have represented the great insurance companies as kind-hearted philanthropists, a combination of Santa Claus and wealthy uncle, whose sole interest is to relieve the distress of widows and orphans—for a ridiculously insignificant consideration.

The impression is consciously or unconsciously created that it is the company that pays the money and bestows favors out of its bounty.

By J. V. NASH

This is the first of two articles by Mr. Nash. The second, which will appear in an early issue, will deal with what you get for your money in life insurance.

As a matter of fact, the insurance companies, like the banks, are in business primarily to make money; and both institutions in their advertisements cunningly play upon the fears and emotions of men and women in order to get business.

The bank appeals to the fear of want in old age. "Save! Save! Save!" it cries. It preaches Thrift as the greatest of virtues and the source of prosperity, whereas the fact is that it is the thriftiest races, such as the Chinese, who live in the most unspeakable poverty, squalor, and commercial stagnation.

A downtown bank in Chicago displays an oil painting, showing a grizzled old man, dinner pail in hand, entering a factory. "Do you want to be in *his* place at 65?" it asks. If life means opportunity for service, as it should, no one ought to make it the goal of his ambition to become at sixty-five a drone in the hive.

What the bank really means is: "Give me your savings, I'll pay you three per cent interest, invest them at seven or eight per cent, and pocket the difference, so that I, who didn't earn the money, will get a bigger return on it than you who did. Then I'll give you back your money to 'blow in' when you've got one foot in the grave!"

Just as the bank plays upon the fear—which is largely imaginary—of want overtaking one's self in this life, so the insurance companies play upon the fear of want overtaking one's dependents after one's death. **The hypocrisy of the insurance companies' solicitude for the widows and orphans is revealed by the fact that it will not insure you if its medical examination shows that there is any great likelihood of your dying, so that those who are in most danger of leaving widows and orphans unprovided for are precisely the ones that the insurance companies are most anxious to leave to their fate.**

Here is an advertisement, deeply hypocritical when the facts are borne in mind, but perfectly heart-rending in its appeal. It shows a woman of refinement; in widow's weeds, bending over a washtub, tears streaming down her cheeks and mingling with the suds, while three or four hungry looking children are grouped around the tub. "Would your loved ones come to this if you should die tonight?" is the question under the picture.

Play on Emotion for Profit

IN SHORT, the insurance companies have persistently played upon the deepest and tenderest emotions of mankind, for their own profit.

This article is not intended to question the propriety of life insurance itself, honestly conducted, on the basis of a square deal to all worthy applicants, without hypocritical sniffling as a mask for shameless extortion. It is well, however, that we should get down to fundamentals and see just what life insurance in essence really is.

With the gambling features of commercial insurance removed, it is, in effect, a species of communism, whereby the misfortune of one person is borne by the community. Suppose a man thirty-five years old takes out a life insurance policy for $10,000, pays the first year's premium of $270, and then dies. His widow receives a payment of $10,000—a difference of $9,730. This $9,730 did not drop from the sky; it was earned somewhere and somehow. Who earned it?

There is only one answer to this question: it was earned by the other policyholders, the company merely acting as the trustee or agent of the little community represented by the policyholders. It was possible to pay this man's family the $9,730, because many other policyholders will not die until so many years have elapsed that they will have paid in, with accrued interest, much more than the face of their policies. *The insurance fund will be further enriched by the lapsing of many other policies through default in payment of premiums.* In most companies, no surrender value is allowed until the end of the second year, and many allow nothing until the policy has been in force three years. The amount of insurance lost to policyholders in this way, especially in hard times, is enormous. In 1913 the companies reporting to the Insurance Department of New York State showed insurance amounting to $355,725,818 terminated in regular ways that year, while $723,469,303 (more than twice as much) was terminated by lapse or surrender.

In other words, many get little or nothing, a few get substantial payments, and the insurance company makes profits on all. "The average duration of life is lengthening, at least in insurance experience," says a prominent authority, "and the insurance companies are making more in consequence." The insurance companies' profits will be, in the case of "mutual companies," fat commissions and salaries, and, in the case of the stock companies, both of these, with dividends to stockholders in addition. Some of the large stock companies showed, in 1922, according to the Insurance Year Book, dividend payments to stockholders ranging from $100,000 to more than $1,000,000.

While the better life insurance companies are less open to criticism, there is a tendency on the part of many companies to trap the policyholder in various ways, such as the printing of clauses in the policy in such small type that they will be overlooked, and to avoid the payment of losses whenever a technicality can be made a loophole of escape. Again quoting a responsible authority:

"In too many cases, however, the companies have shown a disposition to take advantage of obscurities or technicalities in the contract, to avoid paying honest losses. So prevalent has this practice been that the legislatures of many states have considered it necessary to come to the protection of the policyholders."

Viewed from another standpoint, life insurance, as conducted by the commercial companies, is in the nature of a lottery, wherein one must die to win the prize. While lotteries of other kinds have been abolished as against public policy, life insurance is sanctioned by law, but for the protection of the unfortunate and not for the profit and aggrandizement of private corporations.

Just a Gambling Chance

IN MANY forms of insurance, however, the gambling element is only too apparent. There seems to be no limit to the field of insurance in general. Practically anything can be insured nowadays, from an actress's toe to a prize fighter's fists, from a plate glass window to a boiler, from a cow in a field to an elevator in an office building. Certain insurance companies will bet you a round sum of money that it won't rain on a certain day, that your trusted cashier won't commit embezzlement, that you won't break a leg, that a tornado won't carry off your house, that your credit risks will "come across," or that any man you don't like won't be elected President of the United States!

There has been a growing practice of late years to write life insurance out of all proportion to legitimate purposes of domestic protection. Many wealthy men and women have taken out life insurance in excess of $1,000,000 apiece. The largest individual policyholders in the United States at the present time are said to be the following:

Adolph Zukor (Famous Players-Lasky Corporation) $5,000,000.

Rodman Wanamaker, $4,500,000.

Pierre DuPont (dynamite and gunpowder king), $3,000,000.

J. C. Penney (Golden Rule stores), $3,000,000.

Surely no such vast sums as these are required to care for the dependents of one man. How far should public policy permit the accumulation of swollen fortunes in insurance policies?

If these four men, by some strange mischance, should die tomorrow, $15,500,000 would be paid to their estates or beneficiaries. The great bulk of it would, of course, represent the savings of an army of smaller policyholders, utter strangers to them.

As a matter of fact, it is probable that a very large proportion of the huge volume of life insurance in force today is really not bona fide life insurance for the benefit of dependents. Much of it is held by corporations and other commercial concerns on the lives of their officials and owners, the companies being the beneficiaries. In such cases the company pays the premiums, and includes the payments as an item in its cost accounting. This life insurance, therefore, is concealed in the prices charged the public for the products of the company, and so the public pays the premiums if the insured persons live, and the public pays the insurance if they die! These policies, likewise, may be made to yield big cash loans for the benefit of the wealthy holder or his business.

The Fire Hazard Grows

WHEN an individual is heavily insured, there is, moreover, a sinister moral risk introduced. The collection of such insurance by any impatient and unprincipled beneficiary has figured only too often as a motive leading to murder, or criminal neglect of the insured in illness. The insurance of children in favor of adult beneficiaries is especially open to abuse, and it is difficult to conceive any justification for it.

In the case of fire insurance, the fraudulent collection of policies has become an evil of national proportions. Year by year, with the constantly increasing use of fireproof construction, and the growing efficiency of fire control, the legitimate fire hazard is being reduced, yet the annual fire loss throughout the country, instead of diminishing, is growing by leaps and bounds.

Consider these figures:

Fire loss, 1917	$250,753,640.
Fire loss, 1922	410,889,350.

In five years the national fire loss has nearly doubled!

Commenting on this situation, the Americana Year Book for 1922 makes some very frank remarks. It states:

"A good part of this loss is of the sort called *moral*, but should be called *incendiary*. A long list of small New York City fires is attributed to this cause, and an examination of the fire losses in the territory where cotton losses were severe in the last two years disclosed in a diagram that the curve of cotton loss was followed closely by fire losses."

When a stock of goods insured for most of its original value becomes, through depreciation or market fluctuations, unsalable, or salable at only a fraction of the insured value, the temptation to cash in on the insurance by fraudulent means is apparently in many cases irresistible.

But the subject of fire insurance and its abuses de-

The Freest People in the World

A Bedouin Chief Who Pays no Taxes Would Laugh at Our Pretension to Freedom

By BURT P. GARNETT

This is the first of two articles by Mr. Garnett. The second will appear in an early issue.

(C) Underwood & Underwood

Bedouin women at Sinai's base weaving cloth like that of tabernacle curtains.

FOR a century and a half we, in America, have been telling the world and ourselves that we are free. So we are—as free as civilization will permit—but a Bedouin chief would smile in derision at our boast. His contempt for our freedom would match his contempt, like as not, for his cousin of ancient times, the Jewish bazaar-keeper of Jidda or Jaffa or Jerusalem.

Free? When we pay taxes, rent, obey laws, fear the police, go to war and fight under the strictest sort of discipline—against enemies not particularly of our own choosing? Ha! The sheik, he laughs a wild, barbaric laugh.

He pays no taxes. He shoots tax collectors. He knows no landlord. He has no house to enslave him. He lives in a tent, on the lands given to him ages ago. Sometimes foreigners try to interfere with him and make him conform but they learn, without delay and unmistakably, that the Bedouin does not conform to anything aside from his tribal traditions.

When the Bedouin fights, he goes after enemies of his own choosing, and does so with courage and dispatch and efficiency. But when fighting bores him or becomes tedious, he mounts his Arab horse and is off.

This, as the Bedouin sees it, is freedom—real freedom; freedom beyond the offerings of the veriest modern poet.

Moreover, the Bedouin lives. He lives magnificently. He has his camels, his goats, his horses—mobile property and dignified, property that multiplies and provides a living and more, property that takes care of itself, largely, or can be intrusted to those slavish creatures, women. He demands and gets fees from travelers in the desert, timid fellows who are willing to pay and thus protect themselves against robbery.

And so the Bedouin gets money, whereupon he goes to Jerusalem and swaggers through the streets. He enters a shop and bawls loudly for a nargile and tobacco and coffee. His tip to the waiter is a look of proud disdain, and the innkeeper is a pleased man if his guests do not break the nargile over his humble, landlordish head.

On a shopping tour the Bedouin is equally magnificent. What money he has, he spends, and with it he buys silks and jewelled trinkets and whatever catches his fancy, but always drives a close bargain. He scowls, threatens and beguiles the merchant, and perhaps does not steal more than two or three minor articles.

He stalks through the streets proudly and without fear. Indeed, what has he to fear? The hate and resentment of a lot of shopkeepers? Bah! Hate and resentment are what he wants. He would scorn their friendship. But might they not harm him? The sheik's eyes narrow dreamily but with a peculiar gleam in them. True, they might attempt to do him harm, but these shopkeepers have learned that molesting a Bedouin is dangerous business. You see, there are so many other Bedouins to avenge an injured brother in a very violent and disagreeable manner.

Besides, it is not the Bedouin nature to be fearful. He is a Mohammedan and a child of Kismet. If Allah wills that the end of his days is come, so be it.

This seems to indicate a deep religious strain in the fellow. Religious? Of course he is. He is a good Mohammedan. He knows his Koran, learned it by rote in his childhood, but he does not let his religion restrict him in his sense of freedom. He is as free in conscience as he is otherwise, and does not worry about the Koran's rules or whether his conduct might be approved of by the Prophet.

When he reaches early manhood he marries. If his wife nags him or bores him or does not prepare his meals according to his taste, he divorces her and takes another, according to his pleasure.

Civilized peoples, century after century, have sighed and have been troubled at the Bedouin waywardness. They have attempted time and again gently or otherwise to persuade him that he was not leading a godly and helpful existence. They have earnestly endeavored to raise the Bedouin to higher and better things. He has presented a great appeal to missionary-minded folk all through the ages. What a splendid achievement for any man or group of men to bring these splendid fellows into the fold; persuade them to give up their wild ways, accept a code of morals and ethics and become useful citizens!

The Bedouin's physical prowess, his courage, his intelligence and his high spirit all command respect from other races. His laziness, his loose ideas of honesty, his rudeness and disregard of the opinion of other races, and his utter refusal to settle down and be a peaceful, law-abiding person has for centuries been the despair of all who have come into contact with him.

The Bedouin does not rebuff friendly overtures. He is even agreeable, sometimes cordial, toward the Englishman, Frenchman, German or American. He may listen with interest to what they have to say, but if they bore him or suggest that he reform, he is first amused, then annoyed. Persistence on the part of those who have tried to reform him has usually ended in disaster for the reformer.

The Bedouin asks only to be left alone. If necessary he rebukes interference very decisively. He has proved his right to freedom by survival. It is interesting to compare the Bedouin to the North American Indian. The Indian gave way before the white man, and his numbers and his glory dwindled. He lost a continent—two continents, indeed. Civilization caught and enslaved him, tamed him.

The Bedouins, almost from the beginning of history—they claim direct descent from Ishmael, son of Hagar and Abraham, who with his mother was cast out of Abraham's house—have held their lands and their identity, their dignity. Now, as then, they roam all over Arabia, from the Arabian Sea as far as Mesopotamia and Syria, a distance of about a thousand miles. The land over which they roam and call their own is from three hundred to six hundred miles in breadth. They are men of the great, open spaces, indeed.

Since census-taking is a function of government—the sort of government that collects taxes—one guess is practically as good as another as to the number of Bedouins. Frederick Simpich, writing in *The National Geographic* in 1919, estimated that there were ten million Arabs, divided into two groups—Al Bedoo, or "The Dwellers in the Open Land" and Al Hadr, or "Dwellers in Fixed Localities."

Mr. Simpich ventured the opinion that the Bedouins are nomads from necessity rather than choice, but W. H. Porterfield, an American newspaperman, who has just returned from Arabia disagrees with this view.

Mr. Porterfield says that the Bedouin dislikes cities and a settled life. They look with scorn upon agricultural workers and industrial workers, excepting those industrialists—if they may be called such—of their own tribes who weave cloth of camel hair and goat wool, make saddles and other simple tools and accessories such as their nomadic life requires.

With their strength of numbers and their fighting ability, they could easily go into farming districts, put the peaceable farmers to rout and usurp their places. Instead of this, however, they prefer to let the farmers alone, since they provide certain foods that the Bedouin relishes and which he can get by shrewd trading and the money he exacts from travelers.

Moreover, they are aristocrats, sons of The Prophet. This aristocracy does not pride itself on the ownership of property, lands, castles, serfs and overlordship. The Bedouin cares little for these things. His is rather an aristocracy of freedom. His slaves, even, after seven years of service, become freemen—provided they have embraced the Moslem faith.

When an ambitious nation fancies it would like to add Arabia to its dominion—as has happened many times throughout the ages—the Bedouin is indifferent. Let whoever will make his maps and claim that Arabia is his—a part of the Turkish empire, or of the British or of any other. What is a map? The Bedouin laughs at all of his so-called "rulers."

Mr. Porterfield found the Bedouins—all of the Arabs, indeed—glad to be free of the Turkish rule which had endured for so long. The dwellers in the "Fixed Localities" submitted to this rule, but Al Bedoo grinned superciliously at the Turk tax collectors, or fell upon them, according to their whim.

The Sultan's army would go after them and capture a few camels and try to hold them for the taxes they couldn't otherwise collect. This scheme was of little satisfaction to the Turkish officials, however, for the wily Bedouin would manage to steal away the camels and get them back.

The atavistic pride in the ancient Arab civilization has broken out occasionally as the result of the appeal by the missionaries to reform and lead a higher and better life. The missionary schools in Jerusalem and at other points drew some of the younger men. Mr. Simpich recounts the activities of a group of Arab students living in Paris about the time the war broke out. One of these, a man named Najob Azoura, wrote a book, "Le Reveil de la Nation Arabe," which urged "a united Arabia, independent and progressive, a force in civilization, a cradle of renaissance of Arabian art, literature and science."

This idea aroused enthusiasm among the educated Arabs but not among the Turks, who caught many of the Arab leaders in Syria and shot them. This must have been an alluring idea to the idealists among the Arabs, for their ancient tradition is unquestionably fine, particularly as regards the sciences. Mathematics owes the development of algebra to the ancestors of the modern Arab; in physics and astronomy and chemistry they did much of the fundamental work of discovery upon which these sciences today are based.

The historians, Thatcher and Schwill, credit them with the manufacture of paper—or at least, with introducing the art to Europe. The watch and clock were theirs. H. G. Wells, in his "Outline of History" says, "A century or so in advance of the West, there grew up in the Moslem world at a number of centers, at Basra, at Kufa, at Bagdad and Cairo and at Cordoba, out of what were at first religious schools dependent upon mosques, a series of great universities. The light of these universities shone far beyond the Moslem world, and drew students to them from east and west."

The idea of getting the Bedouin to give up his powder play and revive the ancient culture of his fathers is rather amusing to those who know him. It might be compared to a scheme for getting the cow-puncher of the American plains to give up his sombrero for a silk hat of the "stovepipe" order.

Books, telescopes for looking at the stars, holding phials of acid over Bunsen burners? Give up the desert camp fire, the bitter coffee and the nargile for these?

Perhaps Al Hadr may become interested in such ways, but not Al Bedoo!

And why should he? Would the revival result in new work of equal value? Have these Arabs such mighty intellects that their scientific research would establish the Fourth Dimension, discover the secrets of life and of energy which baffle Western scientists?

It seems hardly likely.

From a standpoint of logic, honestly developed argument, taking into consideration the Bedouin's pleasures, his attitude of mind toward life, civilized man could hardly convince him that civilization would do for him anything else than enslave him. Culture accompanies established institutions, restrictions upon personal and group liberty. Laboratories must be kept clean, factories must supply equipment, mines and chemical plants must provide materials with which to experiment.

Why should the Bedouin change

The Magnetic City Where Our West Was Won

Vincennes, Indiana, an Historic Spot Where Brave Deeds Counted Most

By CARL SCHURZ LOWDEN

"On the Banks of the Wabash," with the new-old city near.

THE first time I ever saw Vincennes, Indiana, I felt strangely attracted toward the city. It was as if I had entered a peopled room and spied a pretty girl so noticeably winsome and graceful and possessing such an air of distinction that I could not rest until I had met her. Such a girl would be magnetic. Now, cities are like people; some have magnetism and some have not, but Vincennes has a wealth of it.

The very name of the town calls up the Latin verb, *vinco*, "to conquer." There is something of the conqueror about Vincennes. There is a certain independence that might be described as a queen's pride commingled with the spirit of the winner or pacemaker.

Along with the distinction of itself being the oldest Hoosier city, Vincennes lays claim to having had the first post office, public library, bank, newspaper, Masonic lodge and college in the state within its confines. There the first public land office in Indiana was opened; there the first Catholic, Presbyterian and Methodist churches in the state were built.

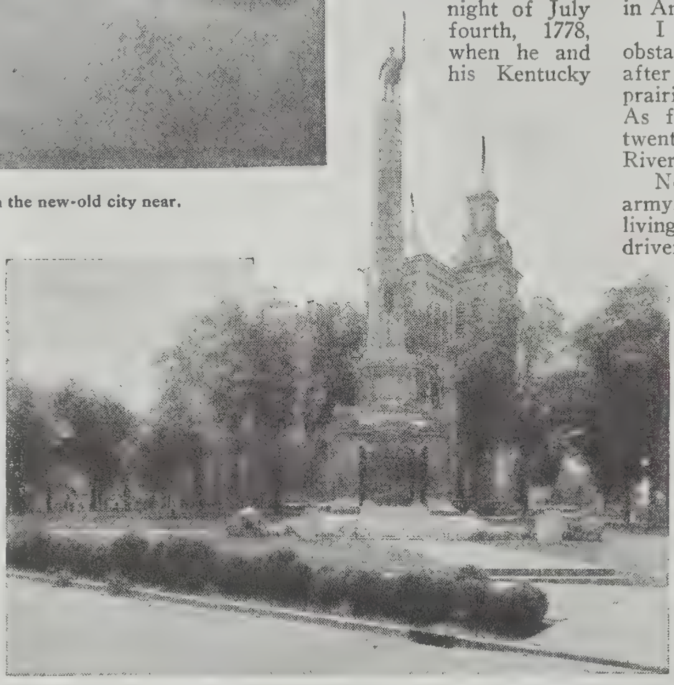
Vincennes University claims the distinction of being the first public school in the United States. The earliest known appropriation of Congress for public instruction was made for the employment of a teacher in this institution. In 1794 President Washington asked Congress to pay Father John B. Rivet two hundred dollars a year. He began his work on the first day of May, 1795. The government was slow and irregular in paying the sum, and the teacher suffered greatly through this neglect. He, however, valiantly carried on his work. At his death in 1804 he was buried in the French cemetery. Long ago the wooden marker disappeared; today no one knows the grave.

The largest Indian mounds in the state lie in a semicircle southeast of the city. Several years ago extensive excavations were made in one of the four mounds. A highly polished mussel shell was found in the right hand of a skeleton which appeared to be that of some tribal medicine man; near by was a bowl probably produced by baking a mixture of ground shells and clay. Close to the right hand of another skeleton rested eight perfect arrowheads; at one side of the neck were a stone tomahawk and the prongs of buck antlers which had evidently been a necklace when deposited there. These and other relics unearthed at that time were donated to the Daughters of the American Revolution, who placed them in the museum the chapter maintains in the brick building occupied by William Henry Harrison when he held the proud position of governor of the Northwest Territory.

This mention of Harrison brings to mind another distinction which belongs to Vincennes. It has been the home of two Presidents, Harrison and Zachary Taylor.

Vincennes has lived under three flags, the flags of the three greatest powers. She was born under France, she matured under England and under the American flag she became the mother of five great states, Wisconsin, Michigan, Indiana, Illinois and Ohio. She served as the cradle of American world power. You can take your map of the United States, find the spot labeled "Vincennes" and truthfully say to yourself, "This is where the West was won." From the standpoint of the amount of territory which changed hands through a single engagement, Clark's capture of the post from the British in 1779, it ranks among the greatest military victories.

Clark, however, first captured Kaskaskia, near the site of the present city of East St. Louis. It was done quite dramatically during the night of July fourth, 1778, when he and his Kentucky backwoodsmen surprised the garrison and took the fort without the loss of a man on either side. Part of his men surrounded the town while another part closed in on the fort. Clark himself stood by the door and watched the British officers dancing. An Indian soon caught sight of him and gave the alarm with a war whoop. The voice of the American rose above the sudden clamor as he bade the merrymakers to "go on with the dance but remember you are dancing in honor of Virginia."



The Knox County courthouse and the soldiers' monument.

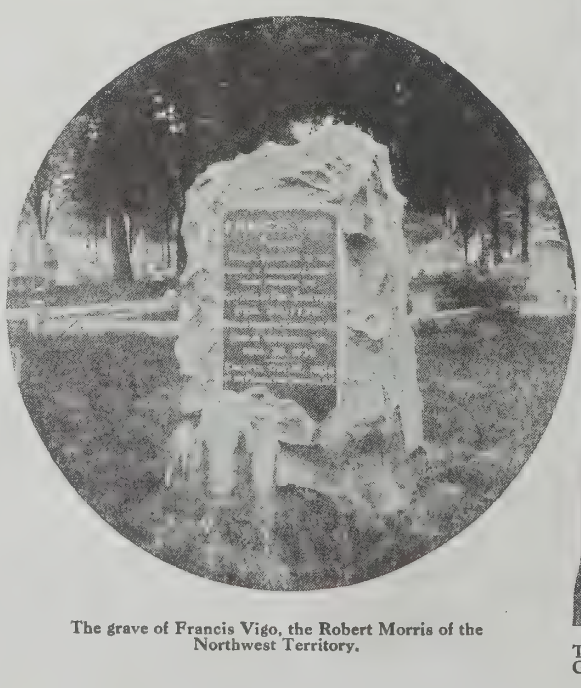
At that time Vincennes was not occupied by any armed force; its inhabitants were chiefly French, and France had become the ally of the United States. Clark sent Father Gibault to Vincennes to secure the allegiance of the populace; this was done. Subsequently Captain Leonard Helm took command of the fort there and proceeded to organize a company of militia from the French residents. A man on horseback arrived at Kaskaskia on the twenty-ninth of January, 1779. He had important news for Clark; for Hamilton had come down from Detroit and taken Vincennes. The British flag flew over the post. Hamilton planned to pass the winter there, then to push on to Kaskaskia and capture it.

Clark was a man who could think quickly and act courageously. He decided to beat his adversary at his own game. He would make an immediate attack on Vincennes while Hamilton fancied himself absolutely secure because of the interposition of winter. The preparations had been so rapid that only six days passed between the coming of the messenger and the start of the march, destined to be one of the most memorable in American history.

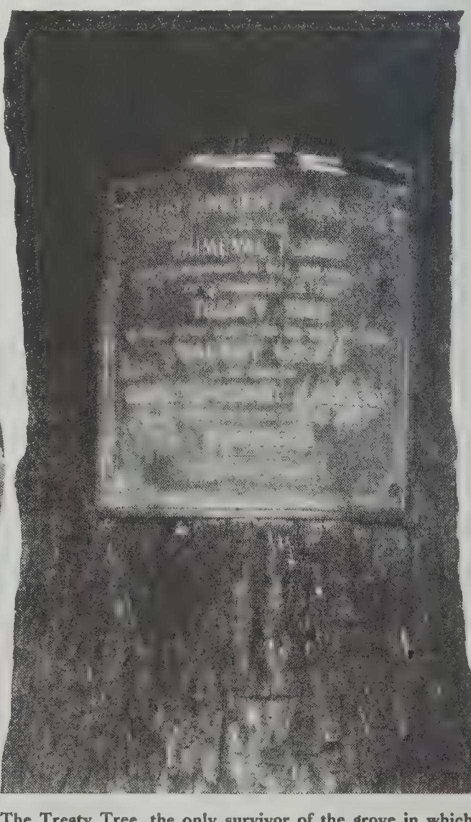
I wish I had space to describe in detail the obstacles the expedition faced and overcame, one after another. It was the season of floods. The prairies were quagmires when they were not lakes. As for dry ground, there was none. On the twenty-first of February they crossed the Wabash River in boats crudely built by themselves.

Now a new danger threatened the brave little army. The food supply was low. They had been living on wild game, but floods had apparently driven the wild creatures away. Besides, they were so near Vincennes that scouting parties might hear a shot, discover the presence of an invading force and make a surprise impossible. He did not wish the strategy of his attack spoiled; so the rifles remained silent, and the men went hungry. Luck favored them on the twenty-third, however, when they captured two Indian squaws and found in their canoe a quarter of buffalo meat and some other provisions. Broth was immediately made, and the downhearted men became a jolly crew.

The determined leader wished to know the exact situation in Vincennes. The French should be friends to the Americans. But were they? Could any support be hoped for from them? Were the Indians hostile? With the town in plain sight, Clark spied some hunters shooting ducks. A band of creoles succeeded in bringing a hunter before Clark, who questioned him. He learned that the French were lukewarm toward the British, and that approximately half the Indians were friendly; but the number of armed men there nearly quadrupled his own. He wanted to proceed diplomatically, to be fair but not to endanger the chance of achieving victory with a minimum loss of life. He decided to take the French inhabitants into his confidence, to inform them of his presence and trust them not to tell Hamilton. It was a bold stroke but it worked out well.



The grave of Francis Vigo, the Robert Morris of the Northwest Territory.



The Treaty Tree, the only survivor of the grove in which Governor Harrison held council with Tecumseh whom he afterward routed in battle.

"Gentlemen," ran the note which he gave to the hunter just before releasing him, "being now within two miles of your village with my army determined to take your fort this night. and not being willing to surprise you, I take this method to request such of you as are true citizens, and willing to enjoy the liberty I bring you, to remain still in your houses. And those, if any there be, that are friends to the king, will instantly repair to the fort and join the Hair-Buyer General, and fight like men. And if any such, as do not go to the fort, shall be discovered afterward, they may depend on severe punishment. On the contrary, those that are true friends to liberty may depend on being well treated. And I once more request them to keep out of the streets; for every one I find in arms on my arrival I shall treat as an enemy."

On the night of the twenty-fourth the invaders entered the town and began firing. At first the garrison attributed the shots to drunken Indians. The fusillade was continued through the night. When the moon set at one o'clock the Americans rushed forward in the darkness and threw up an intrenchment within rifle-shot of the heaviest battery. When dawn came they directed such a hot fire against the portholes that the cannon could not be manned. None of Clark's backwoodsmen were killed and only one was wounded.

A demand to surrender brought from Hamilton the declaration that he was "not disposed to be awed into an action unworthy of British subjects." This happened in the forenoon; in the afternoon the two commanders met in the old French church where articles of capitulation were arranged. Hamilton was bitter at having to give way to a "set of uncivilized Virginia woodsmen armed with rifles."

The twenty-fifth day of February, 1779, marked the fall of Fort Sackville to the men from Kaskaskia. It was an event of tremendous importance, for it gave the new nation "an ace in the hole," when its ministers sat at the peace table in Paris. The midwinter march had given the United States possession clear through to the Mississippi instead of only to the Alleghanies. And so it happened that the nation had room to grow and develop. If the line had been set at the Alleghanies the new nation might not have got on its feet, might never have been able to make the notable Louisiana Purchase in 1803 and later extend its boundary full against the Pacific Ocean. We undeniably know that Clark won the Northwest Territory, and I contend that he did more than any other person in paving the way for the winning of the entire West.

Did the nation show its gratitude to the hero? No. He had been promised thousands of acres of land in an agreement with Patrick Henry, governor of Virginia. The Federal Government was quite careless in carrying out the obligations of the states. The legislature of Virginia voted him a sword, but he died in poverty; he could not eat the sword. A stone marker identifies the site of Fort Sackville at Vincennes as "Captured by Col. Geo. Rogers Clark." It is far too humble for such a great, far-reaching achievement; but it bestows real appreciation where, if ever, appreciation has been strongly deserved.

"I do not know a more heroic achievement in our history than Colonel Clark's capture of Vincennes," one historian poignantly asserts. "I do not know in our history of any greater results from slenderer means than Clark's subjugation of the Northwest. I do not know in our history a sadder picture than the broken, paralyzed old man alone in a cabin, as was Clark's fate; and, lastly, I do not recall in any history a more moving example of national ingratitude than that experienced by the priest, the Spaniard and the soldier."

The soldier, as any one can readily guess, was Clark. The priest was Father Gibault who won the French inhabitants of Vincennes over to the cause of American liberty and prepared the way for American possession. But who was the Spaniard?

A midsummer scene in the residence district of Vincennes.

Do you remember the mysterious horseman who came to Clark at Kaskaskia and told him that the British had swooped down from Detroit and seized the little post on the Wabash? Francis Vigo was his name. He had been an officer in the Spanish army, but had resigned his command and entered upon the business of a trader with his headquarters at St. Louis. He had gone to Vincennes on business, and Hamilton had detained him. The Briton had no authority to hold a Spanish subject; so he released Vigo after exacting from him a promise that he would do nothing to hinder the British cause before he reached St. Louis. Vigo was a man of honor; he held strictly to his agreement, but immediately after arriving at his home he mounted a horse and speedily rode to Kaskaskia and told Clark.

The Harrison House, the oldest brick building in Indiana, also the oldest west of the Alleghanies.

Some writers have called Francis Vigo the "Robert Morris of the Northwest Territory." He had made a fortune through his trading with the Indians and spent much of it to aid the American forces fighting for liberty. Clark's expedition from Kaskaskia to Vincennes might have failed if Vigo had not wisely administered the finances.

About the year 1800 the Spaniard married and built a fine residence for his bride. Upon hearing that William Henry Harrison had been appointed governor of the territory with Vincennes as the headquarters, he tendered the palatial residence to the governor for occupancy until Harrison's own home, then under construction, could be completed.

An ungrateful country delayed reimbursement for the money advanced, and Vigo died in extreme poverty. The justice denied him in life has been partly accorded since his death in 1836.

A township in Knox County and a county in Indiana, also a street and the chapter of the Daughters of the American Revolution in Vincennes, bear his name. The organization erected a rugged granite boulder in a quiet old cemetery of the town he helped to win for the United States.

When Harrison left the Vigo home, he moved into his own, the first brick building constructed in Indiana. It is still standing, is in good preservation and now owned by the Daughters of the American Revolution. A bullet hole in the shutter captures one's imagination. What is the story? This room, across the hall and a short distance back from the council chamber, was the general's bedroom. An Indian, angered at the wrongs done by the whites, attempted to kill the courageous commander as he slept; but the death-dealing missile lodged harmlessly in the wooden panel.

Tecumseh and his tribesmen arrived in Vincennes in August, 1810, to hold a council with the governor who arranged for the meeting under the portico of his home. After placing most of his warriors in camp in the shade of a near-by grove, the chief came forward with a guard of thirty men. Harrison threw open the doors of his home and asked them to enter, but Tecumseh refused.

"Houses," he said, "were built for you to hold councils in. Indians hold theirs in the open air."

The chief then took a position under some trees in front of the brick building. He proceeded to deliver one of his greatest orations, a protest against the cession of land by the Miamis and a demand that the whites relinquish their claim to the land because the grant was not favored by the other tribes. When the great leader, the Napoleon of the Indians, had finished his plea, he turned to seat himself; and at that moment the interpreter uttered Harrison's invitation that "your father requests you to take a seat by his side."

"My father!" the chief flared. "The sun is my father and the earth is my mother. On her bosom I will repose."

All of the foregoing occurred in the large grove of magnificent walnut trees surrounding the house. It was under these trees comprising this grove that a treaty of peace was subsequently signed between General Harrison and Tecumseh. Of this extensive grove but a single survivor remains; it is a scarred and time-worn walnut known as "The Treaty Tree" and bearing a fine bronze commemorative tablet which records its history.

Vincennes has a large building called the Cathedral and built in 1826 by Father Champomier. It stands upon the spot where the first church in Indiana was built, probably as early as 1702. This original church had walls consisting of logs set upon end, the spaces between being filled with mud in which straw from the prairies had been mixed. Within its walls occurred the formal surrender of the Northwest Territory to Colonel Clark following the fall of Fort Sackville. It had in its steeple a simple little bell by which the communicants were called to mass. This bell, since recast, is in the present edifice. It called the people of old Vincennes to this church on that memorable day in December, 1778, when Father Gibault prevailed upon them to renounce the sovereignty of England and embrace the American cause. It has long been called the Liberty Bell of the Old Northwest.

Not all the historic points in the city are as obvious as they might be; so the Fortnightly Club has issued a booklet with a map enabling tourists to locate twenty-four. The forty-three trains daily, the two auto highways and the two airways bring in many travelers; those that tarry a while will discover Vincennes, the place where the West was won, to be an alluring blending of the old and the new.

The site of Fort Sackville which Colonel Clark captured from the British.

Sugar Loaf, one of the four Indian mounds near Vincennes.

Parliamentary Law Rules Legislative Activity

How Skill in Practice Permits a Few to Control the Making of Our Laws

By AARON HARDY ULM

IN THE last session of Congress there were two important bills which a majority of the members of both Houses favored and were anxious to vote for. Both passed the Lower House by large votes. When they came up in the Senate, spokesmen for opposing minorities said, in effect, to the majority:

"We know that if this bill comes to a vote it will be enacted into law. But we put you on notice that it shall not come to a vote."

The explanation of the death of these bills lies in the subtle and little-known realm of parliamentary law.

Yet parliamentary law is something to which the average person pays little attention, especially in connection with public affairs. Only when parliamentary practice is brought dramatically to the front, as in the old criticisms of "Czar" Reed or the wranglings over "Cannonism," is the average voter made conscious of the fact that it counts at all in government.

Yet it is doubtful if any other factor of government has counted for more among Anglo-Saxon peoples, or counts for more today. In fact, the evolution of the Anglo-Saxon type of popular government has been markedly an evolution of parliamentary law and practice. For the lack of a sound parliamentary code, students say, popular government has failed among many other peoples.

Skilled Run Congress

SKILL in parliamentary practice rarely is taken account of in selecting those who are to make our laws. Yet no other type of skill exceeds that in importance. *The best parliamentarians invariably run Congress and other legislative bodies.*

"If I could make it so," a former leader in Congress recently said to the writer, "I would require every candidate for the House of Representatives or the Senate to pass an examination in parliamentary law before being permitted even to become a candidate. For to send to Congress a man who knows nothing of parliamentary practice is like naming an illiterate person a member of a board of education. Either may learn, it is true, but it will take the former about as long as the latter to get on to his job.

"Let me tell you something that will sound astonishing. Because of his ignorance on the subject of procedure it takes the average new member of the House of Representatives at least one year *to learn to hear.* For he must know procedure to understand what is said on the floor or the meaning of various actions taken. Every old member has had new ones come to him and say, 'Darned if I can tell what's going on here.' Everything that's said and done has to be judged by procedure. One who knows this procedure could stuff his ears with cotton and yet 'hear' everything. The time of day, the day of the week or month, the men taking leading part on the floor, the man in the chair, all have a bearing on the real meaning of transactions. Thoroughly to learn all this takes experience, but knowledge of the rules and of the fundamentals of parliamentary law helps immensely. And a member must know these if he ever achieves anything. He may be a great orator, a powerful lawyer, a superb handshaker, but unless he develops parliamentary skill he ever will be dependent for results on those who do."

Not Made, Just Grows

PARLIAMENTARY law differs from statutory law in that it is not made—it grows. It is more like the English common law, that is, custom evolved from experience.

The precedents which govern the Congress come down from the First Congress, though some are taken from other fields, and constitute a big literature. As compiled by the late Asher Hinds in 1907 for the House of Representatives alone, they fill eight thick volumes. A similar compilation of Senate precedents fill one large volume.

These precedents comprise important decisions made by various presiding officers of the Houses themselves on points having to do with the rules.

These decisions frequently have had curious as well as far-reaching effect.

The city of Washington, or rather, its situation on the Potomac, is an object lesson in what a minor technicality in parliamentary law may lead to. *But for an incidental ruling on a parliamentary point raised in the United States Senate, the national capital would be on the Susquehanna instead of the Potomac River.*

Both Houses of Congress voted to establish the national capital somewhere on the beautiful Pennsylvania river. One of the Senators from Pennsylvania wanted it located near Philadelphia and moved a reconsideration. The point was raised that inasmuch as he had voted for the bill, his motion was not in order. John Adams, who as Vice-President was presiding over the Senate, held that it was in order. This gave Hamilton and Jefferson a chance to make the famous political deal whereby the national capital went to the South in return for that section's help in paying the Revolutionary debts of Northern states. A year later John Adams reversed his ruling on the same parliamentary point when raised in connection with another subject!

Adams' son, John Quincy, when in the House of Representatives, once took a bold step in the realm of parliamentary practice which, some of his admirers of the time said, entitled him to more fame than anything he had ever done, though he had been President and in many other high positions. When a new House of Representatives came to organize it was found that the balance of power lay with five contested seats. The clerk of the House, who was presiding, stated that he had no authority to call the names of any contestants for those seats. As no one could vote for those seats, neither side in the House could command a majority and therefore it looked as if the House could not organize and begin its work. A motion was made that the names of persons formally certified be called for the purpose of organization. The clerk ruled that he didn't have authority to put the motion.

"Well, then, I'll put the motion," declared John Quincy Adams from the floor. He did so, the motion prevailed and a possible breaking down of government was prevented.

Similarly did Henry Clay, later on, hold that, though no rule gave him as Speaker the specific authority, he, as presiding officer, could and should refuse to entertain motions made for purposes of delay and obstruction only.

By such bold steps in the realm of parliamentary practice, orderly government often has been saved from severe embarrassment if not complete breakdowns.

The writer once witnessed the taking of a peculiarly dramatic step by a presiding officer in a state legislature. It was the last night of the annual session. A disgruntled member resolved to force an extra session by preventing the passage of supply bills. He began to conduct a filibuster by the well-known means of demanding roll calls, moving to adjourn, and otherwise stopping the practical transaction of business. When the Speaker saw what was up he ruled the member out of order.

"I appeal from the decision of the chair," the member shouted.

"On the ground of public policy, the chair declines to entertain the appeal," declared the presiding officer.

When the member refused to take his seat, the presiding officer directed a husky doorkeeper to use physical force in suppressing the filibuster.

Filibustering was formerly used quite frequently in both Houses of Congress; it rarely occurs now except in the Senate.

By reason of a long line of decisions from the chair as well as many changes in the actual rules, it has become almost impossible for action to be prevented in the House of Representatives by dilatory tactics alone.

Reed Ruling Still Holds

THE culminating decision was the famous one of Thomas B. Reed whereby he directed the counting of a quorum regardless of whether all members present answered to their names when called. Before then a minority in the House often could tie the body's hands by simply refusing to answer roll calls, thus producing a "no quorum" situation.

Reed was violently denounced but his ruling still holds. However, the power of the Speaker was greatly reduced when so-called "Cannonism" was overthrown.

It was because of parliamentary law that the Speaker of the House of Representatives became the second most powerful official in the government. *The great power once exercised by the Speaker, some students of the subject say, steadily is drifting into the hands of the leader of the majority on the floor.*

For if large assemblies like the House of Representatives do much work it is necessary that power to direct affairs lie in a few and perhaps in only one individual. Under lax parliamentary practice, a few persons in any large assembly can prevent anything being done.

Under strict rules like those governing the House of Representatives, free discussion on the floor becomes impossible. Genuine debate has all but disappeared from the Lower House of Congress on account of the fact that no one yet has been able to devise rules whereby debate may be free and unrestrained without giving to a few the power to "talk" almost any measure to death.

No Restraint in Senate

DEBATE still is unrestrained in the Senate; that's why a determined minority there often can "lay the law down" to the majority. Single members of the Senate sometimes do this. Senator Tillman once compelled the Senate to grant a claim he was interested in, by threatening on the last night of the session to read from Byron's poetry until the hour for final adjournment. Three members, lead by Senator LaFollette, would have prevented the passage of the Vreeland-Aldrich currency bill, but for the fact that one, Senator Gore, of Oklahoma, was blind. After a long dilatory speech he sat down, thinking another one of the group would take up the filibuster. The other two happened to be out of the chamber, and thus the filibuster was lost.

"A little group of willful men, representing no opinion but their own" defeated in the Senate President Wilson's Armed Neutrality Bill in 1917. This incident caused the Senate to amend its rules, so as to add to its procedure a measure of what is known as closure.

Closure is perhaps the most difficult branch of parliamentary practice. In usual form it means that when the majority of a deliberative body wants to stop talking and vote it can do so. But to permit it in full form means putting a minority at the absolute mercy of the majority, as is now the case largely in the United States House of Representatives where strict closure rules prevail. It takes a two-thirds vote to bring about closure in the Senate. Under strict rules of closure, the last tariff bill, for instance, passed the House after only a few hours of discussion. In the Senate it was debated for several months.

Most members of long experience in Congress oppose the applying of strict rules of closure in the Senate. Even Senator Lodge, whose historic Force Bill was defeated because of the absence of such rules as prevail in the House now, opposes closure. Senator Hoar, of Massachusetts, who at one time favored closure, stated before his death that he had never known a measure which the public really wanted to be "talked to death" in the Senate.

Parliamentary practice is so complicated that now, with a House of Representatives of unwieldy size and more work than can be done within the time allowed, it has become necessary for most operations in Congress to depend on common agreement. This takes the form of "unanimous consent" in the House or "Senatorial courtesy" in the Senate. Unless all members of both Houses agreed, as a rule, to go ahead and do something, very little could be done. Now and then an individual member of the House throws discretion to the winds and satisfies a grievance by objecting to every request for "unanimous consent." He thus operates a "one-man filibuster," but no one has ever dared to carry on one for more than a day or two.

And it is singular that no Senator has ever dared to make assault on the vague and subtle thing, almost unknown to accepted parliamentary practice, called "Senatorial courtesy."

Would Have Ended "Courtesy"

SEVERAL years ago a very daring public man, when running for the Senate, promised if elected that he would do so. Unfortunately for the annals of dramatic history, he was defeated. Had he been put in position to make good on his promise, a tremendous revolution in government might have resulted. No one can tell how far-reaching would be such a feat, which at any time might be carried out by a single Senator and in great degree by a single Representative.

"I couldn't do it now," says the man who once proposed to do it. "For I couldn't stand the strain; it would kill me."

Though such an undertaking as he proposed would put on him a strain that no man in position to has yet dared to risk, it would put a still severer strain on parliamentary practice. The whole fabric of parliamentary law, the evolution of a thousand years of experience, might break under such a test.

Thus it is easy to see how important is this phase of public affairs.

Because of a failure of parliamentary procedure the old government of Poland went to pieces. The old German Confederation went to pieces in a similar way. Some historians say that the horrors of the French Revolution were the direct outcome of the failure of parliamentary practice. The country for centuries had had no legislative assemblies. Hence there were no parliamentary experts to run the States General or its successor, the National Assembly, when they were called together. Since the latter, as Macaulay says, couldn't make rules for governing itself, it felt entirely competent to set forth principles for governing all the world.

It is probable that Bolshevism in Russia is largely the result of a similar absence of parliamentary traditions. The lack of these traditions frequently have marked the breaking down of government in many Latin-American countries.

Experts Often Employed

ELIMINATE all the capable parliamentarians from its membership and its employed personnel, and our own Congress probably would be as helpless as an average legislative body in Venezuela or the Ukraine.

But Congress in its wisdom takes no such risk. It even employs outside experts to help in the matter of parliamentary law. For a long time the Speaker of the House of Representatives has been provided with a parliamentarian, who assists him in keeping up with the precedents and in making rulings. In fact, important rulings are more the product, ordinarily, of the Speaker's parliamentary clerk than of the Speaker himself.

Our national attitude toward parliamentary practice has been so indifferent that, as the late Champ Clark indicates in his biography, not even a Speaker of the House of Representatives has ever been elected chiefly because of his skill in administering parliamentary law. Most of them, however, have been capable parliamentarians, for usually they are leaders on the floor—only three newly elected members ever have been elected to the Speakership—and no one who is not skilled in parliamentary practice can do much leading on the floor of any large assembly.

Perhaps the chief reason the radical bloc in the next Senate is expected to count for much is that it will be led by Senator LaFollette, one of the most capable and boldest parliamentarians in Congress.

And some say the Republican lead in the House of Representatives also will be greatly confused and perhaps offset by the fact that in the new Lower House the Democrats will command the largest amount of expert parliamentary ability. This is because several of the best Republican parliamentarians there in recent years have dropped out while the best ones among the Democrats are still on the job.

Mr. Ford's Page

AMONG the many failings in the common thought is the tendency to think that because things are different they are therefore worse. The hardest experience to which we have to become accustomed is the experience of change, except that change which goes on imperceptibly in ourselves. It is somewhat astonishing to observe how often the word "old" and the word "good" are used together. The old is good in retrospect; when it was the new, it was unwelcome, too. The Colonial fathers did not feel colonial, and "the good old times" were judged by those who lived in them to have been the worst up to that period of the world's history.

One of the commonest of the complaints concerning the changes that have come over the world is that it is drawing the lines tighter, is harder and colder than before. There is less neighborliness in our cities; there is a decrease in understanding sympathy between man and man; there is not the readiness to help one another which we fancy there formerly was; people seem to take their emotional and friendly life through plays and novels; and sometimes it seems that the only common acquaintances tens of thousands of people in the big cities have are the characters on the comic page of the evening paper.

> *IN A sense the world is growing harder, because it is growing sounder and more mature. Hardness need not mean harshness. The lines are being drawn tighter, but only upon the old weaknesses, the old flabbiness which used to make such constant call upon the virtue of sympathy and helpfulness. People stand upon their own feet more than formerly, have less need to ask aid, have less experience with the causes which may reduce people to the necessity of asking help, and therefore the old precepts which made this form of helpfulness the chief virtue are passing away. It is not that the world is harder, but conditions have changed, and we are not wise to conclude that because things are different they are therefore worse. It is our duty not to protest change but to interpret it.*

Thus the complaint runs. It is intensified whenever a visit to the country shows us remnants of the life that used to be, when neighborliness was an economic necessity, when people had to help each other if anybody was to get along at all. It is rather strange that lighted windows across half a mile of snowy fields should suggest more neighborliness than miles of city boulevard lined with lighted apartment houses. But so it is. Scarcity of people makes for acquaintance, where multitudes of people remain strangers.

There are, however, several matters to be taken into account before drawing a harsh conclusion. They are worth a moment's description because they may prove the clue out of the maze to some honestly puzzled mind. Take first oneself. Oneself is the glass through which we think we see these changes, so that it is wisdom to look at the telescope we are using. The world is always kindly in appearance to youth. Youth is not afraid of the world. The world bristles with opportunities and invitations to youth. It is when the hardening of responsibility comes, it is when a view of the real seriousness of life arrives, that the scene seems to become more somber. And yet you may be confident that youth following on behind finds the same old inviting world that you found in your youth. So that when we consider the element of personality it becomes a question which is hardening—we or the world.

And then there is the changing character of economic life to consider. It is within the memory of all yet in middle age that even in our cities a more compact community life was lived than is possible now. There was not such a large moving population. We are in a period when all classes and all cities are being mingled; a new sort of pioneer period when families move hither and thither with a freedom unknown twenty-five years ago. Travel is no longer a novelty. It is always so when new combinations of life are about to be made. But it does make for an individualism which, while more self-reliant, is yet less warm —outwardly, at least—than the old neighborly stay-at-home sort of life. But the change is on; its urge is from a source beyond our conscious will; and it is a phenomenon to observe and interpret rather than fruitlessly protest.

Moreover, there is the change in the character of help that can be given. For that is what it comes to at last—the help that man may receive from man. One is struck when in the country with the fact that all that anyone needed could easily be contributed by neighbors, for all possessed the common necessaries of all. Exchange in commerce or in charity was "in kind." Help was easy to give, easy to get. It is true in the country today, though help "in kind" is a rare need now. But when we come to the millions in our cities the whole complexion of human need changes. About the only way left to help a man is with money. In the city almost all difficulties can be handled with money. Everything is bought and sold. Except with money, or influence to get employment, there is practically no way to help a family in distress, if that family lives in the city. It is not a question of sending in food—it is a question of rent bills, and fuel bills, and light bills, and other bills, and all the expenses which were quite unknown in the country, or even in the city three or four decades ago. And when you reduce neighborliness to dollars, the self-protective instinct arises, and families are more careful than ever they were with bread or blankets.

These are some of the factors which enter into people's complaint that the world grows harder, that lines are being more tightly drawn. But the facts are not all on one side. There has been too much emphasis in the past on the possibility of relying on others and too little on the necessity of relying on oneself. This is said in spite of all the philosophy of self-reliance, for while the higher teaching pointed toward independence, a great deal of the common teaching had the effect of leading people to expect some form of charity.

This apparent hardening of the world seems to mean that more people than ever before are standing on their own feet, asking for nothing, and that they are therefore more inquiring toward those whose tendency is to be asking for something. There is, for example, a great decrease in borrowing; people don't have to borrow as formerly they did; and they look askance at borrowers as they never did before, not out of hardness of heart, but out of inquiry as to what caused the necessity to borrow.

So that the whole situation resolves itself into this, that our communities are made up of people who have guarded their own interests so well, as it is everyone's duty to do, that they do not have to put themselves upon the mercy or sympathy of others. Private management is perhaps a higher art today than it ever has been. People are not led away by illusions as they used to be. It must be remembered that this generation has passed through some pretty severe lessons in this respect, and caution has superseded thoughtlessness to a very large degree. The old free, hand-to-mouth way of living has largely passed. Most people have stakes in life that breed responsibility. About the only two elements that bring breakdown today are folly or tragedy, and, of course, those who make an appeal for aid are asked which it was in their case.

That is the change that has come over the world—the need for constant exchange of material aid having passed, the habit of extending it, and the whole list of sayings and doctrines that impressed it have passed also. Poor Richard's Almanac has become in fact the working schedule of the major part of the American people. Poor Richard had a certain hardness about him, no doubt of that, but it was such a hardness as was a shield against a very enervating kind of softness. One may be hardened without being hard or harsh. A certain amount of hardness is necessary to soundness. Mushy characters, like mushy apples, are not admired and are of little use. Perhaps another change will come, in that, having settled our material independence, we shall go back again to the true element in the old neighborliness which we have lost.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Retirement of Our Debt

RESPONSIBLE authorities have not yet presented a definite plan to retire the national debt. Occasionally, a fiscal report from the Treasury Department will contain a casual reference to the gradual reduction of the debt. But a workable program completely to wipe out the present obligations of the Government is still to be offered. The stupendous size of the debts in the aggregate and the uncertainty over the payments of the obligations owed to the United States contribute to a general vagueness over retiring the debt.

The time to act is approaching. More than five years have passed since the conclusion of the World War. It was the prosecution of this conflict which resulted in the incurring of the greater portion of the present national debt. During the five years of peace, an unsettled peace, it is true, the country has approached a point from which a calm survey of future financial prospects may be attempted. The nation underwent one period of somewhat violent deflation. It may with reason hope for a steadier and more gradual progress toward normal peace-time conditions. These conditions cannot be reached until the burden of war-time debt is lifted. That lifting, it is obvious, will take a long time. How long, the public is entitled to know. It is clear that no principle of justice can permit the war debts to remain a continuing obligation upon future generations.

At the conclusion of the war, it was estimated that the United States owed approximately twenty-seven billion dollars. The sale of war-time properties, cancellation of contracts and liquidation of other sorts, together with payments during the last five years, have resulted in a considerable reduction, however partisan figures may differ.

At the conclusion of business, December 31, 1923, the Department of Treasury announced that a net reduction of the debt of $400,000,000 had been accomplished during the year, and that the public debt stood at $21,589,160,346.

The retirement of the national debt should be made a fixed policy. If it is not a fixed policy, the temptation will be a constant one for political administrations and Congresses to defer proper debt payments to procure a nominal lightening of the tax levy.

It should not be difficult for the government to formulate a tentative program of retirement, based upon present financial conditions. Regular payments of interest charges are mandatory. Regular payments on the principal of the debt are vital to the continued prosperity of the nation. A program of debt retirement, prepared under present conditions, need not be injuriously affected by the fact that arrangements have not yet been made for the refunding of the debts of all foreign governments to the United States. Payments on those debts, when made, will be accepted as means of accelerating a good purpose. They need not disturb an orderly program of debt retirement prepared with present resources alone in view.

End This Bootlegging, Too

ATTENTION is called to the fact that an immigration bill, proposed by Representative Johnson which passed the last House of Representatives and failed in the Senate, contained a provision vital to the enforcement of the prohibition laws.

The measure required that aliens, convicted in a court of record of violation of certain laws, including the prohibition laws, be deported.

A similar provision is contained in a bill now pending in the House, one which was also presented by Mr. Johnson, who is the chairman of the Committee on Immigration and Naturalization.

Another phase of the proposed immigration legislation which is before Congress will commend itself to the public. It is the proposition to extend to Mexico, the West Indies and other parts of the western hemisphere the provisions of the quota law, now part of the general immigration policy of the nation.

There is a natural desire on the part of residents of the United States to show preference to fellow-Americans in the administration of such laws as the immigration measure. But this preference has caused trouble in the enforcement of the Dillingham law, now on the statute books.

Bootlegging of aliens from Cuba, Mexico and Canada has been an evil with which the Department of Labor has been unable to cope. The proviso in the last immigration law whereby direct admission of aliens from adjacent countries was possible, made a brief residence of Europeans in those favored countries a means of evading the American law. Europeans, inadmissible under the quota laws, found they could enter the United States by going first to an adjoining country. And those, still inadmissible, often discovered ways of getting smuggled into the United States. Secretary Davis has called attention to this danger to the enforcement of the American immigration laws. The extension of the quota laws to adjoining countries will discourage undesirables from taking roundabout methods to reach this country.

National Bank System Doomed?

"IT NEEDS but a slight acquaintance with American banking," says the *Pacific Banker*, "to be conscious of the fact that a perceptible movement is on to change from the National to the State banking systems. A leading banking paper in Boston is running a series of editorial articles under the head, 'Are the National Banks Doomed?' In his annual report, issued this week, Controller Dawes asks the same question."

Here is a point in the conduct of public affairs emphasized by a condition in the banking business of which little information has leaked out, but of which the banking fraternity is fully aware. The *Pacific Banker* tells us the matter is the subject of keen interest in conference and convention, and quotes extensively from opinions as to the cause, without, however, once alluding to the fact that the doom of all banks, especially all small banks, was sounded as a principal object of the Federal Reserve System. National banks were drafted into the Federal Reserve under duress. To those not blinded by the glittering promise of huge return the forced membership is even yet abhorrent.

Banking changes will come in one of two directions. Either the Money Monopoly will be strengthened by still further restricting the power of issue, or there will be legislation giving all government obligations the circulation privilege, and permitting holders to issue government currency upon deposit and waiver of interest.

This will be a transfer of an interest-bearing debt to one costing nothing in usury, thus benefiting the whole people in more ways than one.

Make the Ships Pay

THE action of the Senate Committee on Commerce in disapproving of the recess appointment of Edward P. Farley as chairman of the United States Shipping Board may be accepted as the last act in the Lasker administration of the American Merchant Marine, an experiment in advertising for which the American taxpayers have shouldered a big bill.

Mr. Lasker, whose crowning achievement as head of the Shipping Board, was the *Leviathan's* joy ride to the West Indies, was credited with having induced President Harding to appoint Mr. Farley to his place. President Coolidge offered his predecessor's recess appointment to the Senate without comment. The Senate approved the vast majority of these selections. On Mr. Farley, the disapproval was almost unanimous.

The Senate Committee's action should be the end of efforts to make the United States Government a means of self-advertising.

The country has reason to expect the shipping policy of the nation to be placed in the hands of experienced shipping men who will make the best of the situation. The shipping policy of the country should be determined without delay. The fate of Mr. Lasker's subsidy idea is proof that the country expects the merchant marine to be operated on its merits. The Shipping Board must devise the best possible plan of operation and liquidation, which will enable a maximum of benefit to be obtained from the Government fleet and permit the immediate disposal of ships which cannot be used.

Let City Folk Be on Guard

THE recommendation of the Secretary of the Treasury, followed by the President's message, urging a reduction of the Federal taxes, proved infectious.

Governor Alfred E. Smith, of New York, suggested that the legislature of that state cut the income tax by twenty-five per cent. Executives of other states have suggested similar reductions. But there are more tax-imposing agencies to be heard from.

These are the American cities.

Federal and state taxes have grown vastly in recent years. But taxes in the majority of municipalities have proportionately outstripped both state and nation.

Executives of municipalities are closer to the people than officials of either state or nation. The popularity of the suggestion that Federal taxes be cut must have been clear to municipal authorities. That tax-cutting by municipal agencies will be demanded is certain.

When municipal authorities cut taxes is the time for the public to be on guard. Too often, politicians seek to give the semblance of tax reduction without the substance. A favorite method of "lowering" taxes in a municipality is by raising property assessments, thereby cutting the tax rate but making no appreciable difference in the volume of taxes each individual must pay. Another means of effecting a temporary but costly saving in taxes is by bond issue. In some cities, the constitutional and legal safeguards are not sufficient to prevent the manipulation of appropriations, so that money for running expenses is raised by sale of bonds rather than by direct taxation. In such municipalities the need for the people to be on their guard is vastly increased.

Municipal taxes everywhere should be reduced. But the reduction should be procured through real economy, and limitation of expenditures, not through juggling of assessments or borrowing from the future.

Filling Our Posts Abroad

THE advent of each new administration in the United States renews the discussion of the wisdom of developing the profession of diplomacy, so that posts at foreign capitals may be filled by trained diplomatists rather than by the rich backers of the party in power.

The circumstances surrounding the retirement of Sir Auckland Geddes and the appointment of Sir Esme Howard as British Ambassador at Washington may indicate that England is about to forsake in some measure its traditional adherence to a system of trained diplomats. This may sound paradoxical because Sir Esme is perhaps the most distinguished diplomat in the British service, while Sir Auckland Geddes rose to ambassadorship more in the American style through distinction as an educator followed by brilliant service in British domestic public life.

But Sir Esme's appointment was made by a Tory government which had been just repudiated at the polls. And the haste manifested aroused the belief in the Labor party that the appointment was made to prevent the succession to the ambassadorship of a man who might reflect in Washington the views of that party.

The British foreign service has traditionally been something of a sacred institution. Whether Liberal or Conservative was in power, the foreign office policy followed its accustomed course. The criticism among Labor party members over the appointment to Washington suggests that the time is approaching when the British tradition of a trained diplomatic service may be changed.

In the meantime, American public sentiment has been proceeding steadily toward the goal of a trained service for this country.

Perhaps, neither the British idea nor the American custom may be wholly correct. The trained service has the advantage of knowing its business, but it has the occasional disadvantage of lacking initiative. Highly successful business men, appointed to the important posts in the foreign service, possess the necessary initiative and good judgment. But they lack the training. Some method whereby the nation's foreign service could command the ablest men, but not be a plaything of politics, would work to the nation's advantage in the selection of our envoys to foreign countries.

Developing Community Life in a Village

Elcho, Northern Wisconsin Hamlet, Is Rebuilt as a Nuremberg Town

By FRED L. HOLMES

THERE is still much of the wilderness in Northern Wisconsin. Cities are far apart. A joining thread of trunk line highways links in its chain lumber camps, summer resorts and hamlets. Hastily built frame villages now aspire for city honors just as the near-by pioneer clearings strive for the rank of farmsteads. In the open country where the lumberman's pines stood half a century ago, an undergrowth of tangled sweet fern, a thicket of chaparral, and a sturdy second growth of trees abound.

During the early autumn this is a wonderland of scene and color and smell. The highways seem unending. Feathery little patches of grass blend into the coarser textured green. Wood tangs of sassafras and aromatic tamarack; a sickish flavor of bruised horse-mind and overripe wild raspberries float into the roadside. Above the thick masses of green comes the flash of a goldfinch over a thistle; an open space of burnt-over ground is spread with a blanket of brilliant, blooming fireweed. Beyond, a deer clears the road with a single bound. The hot sunshine filtering into the dark jade scenery expands nature into a brooding spell of tenderness, unfolding power and fulfilled fecundity. Enchantment comes from riding through long distances of this waving, pulsing, developing, variegated landscape.

Into this region of 3,000 lakes, plowed out of the earth's surface by giant glaciers eons before the planting of nature's forests, the tide of settlements has been advancing gradually. The Indian trading post has become the village. As prosperity touches the pine-scented country, the villages, one after another, shake off the lethargy of lumber camp roustering and take on the mantle of modern community development. The 2,500,000 tourists who visit Wisconsin's lakes annually, spending more than $88,000,000, are inspiring a community rivalry not unlike a contest between fervent, exigent lovers in spring.

Just now Elcho, a village of 150 homes on the border of the land o' lakes in Northern Wisconsin, is the cynosure. It is the visitor's dreamland set in a splash of emerald. Within a year it has been transformed from a ramshackle of polyglot one-story frames, into a Nuremberg village wearing a touch of medieval artistry. Elcho is the lengthened shadow of Charles W. Fish, a lumberman, who has owned the village and its industries for nearly twenty years. When a fire laid the old buildings in scarred ruins and ashes last February, he realized that the time had come for a change. Out of the lumber from the encroaching forests and the bricks from the clay beds near by, a new design of business and community village has burst into bloom. Elcho is thriving, building, expanding, lifting its head above the girthing forests, because it is different.

"For a long time I have wanted to build a village that my children and grandchildren will be proud of," soliloquized Mr. Fish as he viewed the smoking pile. "I guess this is as good a time and as good a place to start as any. I have waited for an opportunity to begin at the bottom. No longer need I delay."

Architect and village planner have changed the face of old Elcho—yet the Elcho in ashes was not so old. Within the memory of Indians on the Lac du Flambeau Indian Reservation it has been the site of a village, the scene of tepees and Indian dogs and warriors. Over these hunting grounds the Sioux and the Hurons shifted back and forth in their struggle of rivalry. It must have been a contented Indian village life, for to this clearing of pine and hardwood the Lac du Flambeaus gave the name of "Elcho," meaning "happy," a name also applied by them to a good-natured cat that greeted them every time they visited the village store.

Most of the pioneers of Northern Wisconsin are still living. Communities are new. The story of development is of easy access. Forty years ago the ground on which Elcho now stands was a wilderness solitude. In 1882 the land was purchased from the Government and a veneer plant was started. Three years later the Jones Lumber Company, of Appleton, purchased the plant and expanded the operations.

Logging operations went on uninterruptedly for more than twenty years. The giant Norway pines and hemlocks were cut. It was the heyday of the lumber boom in Wisconsin, when every spring saw the streams and rivers choked with logs being rafted to the mills below.

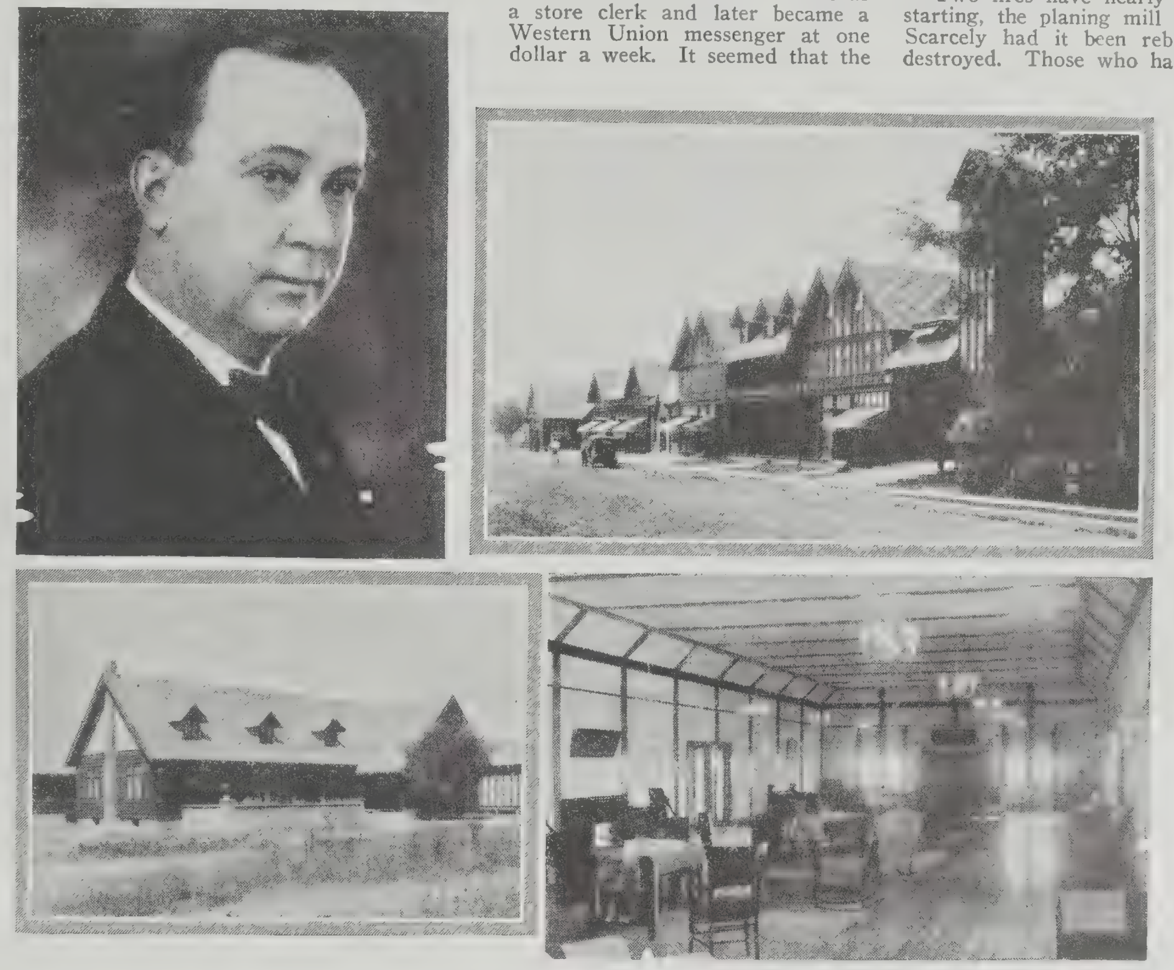
One day in 1898, a member of the Jones Lumber Company firm met Charles W. Fish. The occasion was of only passing interest at the time to the official. Mr. Fish was an ordinary-appearing young chap. Something he said in reply to the questions advanced in the conversation, however, turned the career of Fish from a structural iron worker to that of the largest individual operator in lumber in the country.

"What are you doing?" asked Mr. F. D. Jones.

"I've the hardest work in the world," came the reply. "I am looking for a job."

A bargain was struck at once. Mr. Fish was to go to Elcho to clerk in the general store at thirty dollars a month. He borrowed five dollars from a friend to pay railroad fare and started. After he became established he rented a log cabin and moved his family. He thought that luck was coming fast when the railroad company offered five dollars a month for a man to look after the incoming freight. An income of thirty-five dollars a month gave him a satisfactory outlook on life.

"I hadn't been as successful before I came to Elcho," explained Mr. Fish, now the operator of four large sawmills with an output running into several millions. "I started life as a store clerk and later became a Western Union messenger at one dollar a week. It seemed that the big steamers at the Manistee lumber dock called to me, so I became a sailor serving on an old propeller carrying lumber to Buffalo.



Top, left—CHARLES W. FISH; right, Main street, Elcho. Below, left—The community house at Elcho built by Mr. Fish in fulfillment of his dream for an ideal community; right—An interior view of the community building.

"It was in 1895, when I was eighteen years of age, that I joined the rush to Cook's Inlet, Alaska, before the larger Klondike excitement. There were sixteen members in our party and my father staked me with a few hundred dollars to make the trip. We prospected all the summer of 1895 in Turnagain Arm and I lost nearly all I had. One of our party contracted sciatic rheumatism and the members drew lots to see who was to care for him. I picked the long straw and my occupation shifted from gold digger to nurse.

"One day a mail boat that came once a month touched the coast. When the captain asked for an able-bodied man to act as sailor, I responded at once. We sailed on the steamer *Commodore Perry* in the coastwise trade and at the close of the season I returned to Lake Ann, Michigan."

"Did that end your career as a sailor?" I interrupted.

"Not at once," came the reply, little noticing my question. "I went back to sailing on the Great Lakes and stayed at it for four years. One day when I reached Cleveland I quit. I couldn't stand for the vulgar language of the captain. In the four years I had reached the standing of second mate and was probably the youngest officer of a big boat on fresh water.

"Time and again after that I was offered good jobs as a sailor, but I was so disgusted when I quit at Cleveland that I determined I would never sail again. I went to Manitowoc, Wisconsin, and got a job with a structural iron gang. It was while following this trade that I made the chance acquaintance with Mr. Jones, an incident that immediately changed my career in life."

Elcho was just a lumbering town when Mr. Fish went to clerk in the company store. It had four shacks that were used as dwelling houses, a general store and "just woods." The hours of work were long, from seven o'clock in the morning until about ten o'clock at night.

"I think the happiest days in my life were when my wife packed my dinner pail and I started forth to work, returning in the evening tired but glad to be home," interposed Mr. Fish.

Opportunity came. A settler, tired of making a clearing, came to the store and offered his tract of 160 acres for fifty dollars. Fish had saved fifteen dollars out of his wages and he started out to borrow. Seven friends advanced five dollars each and the purchase was made. About a year later the lumber company decided it wanted the tract. It sold for $3,300.

"That was the beginning," remarked Mr. Fish as he told of his first venture. "I thought I saw other opportunities. I began picking up timber."

With the cutting of the big trees, the lumber business seemed to be dying out. Many of the older operators declared it would be useless to log the smaller timber.

"'Charley, if you can get the money you can buy this store,' remarked Mr. Jones one day. I got the money. Then I purchased the mill. I guess that is about all there is to the story."

Two fires have nearly ruined him. When he was starting, the planing mill burned with little insurance. Scarcely had it been rebuilt, when the sawmill was destroyed. Those who had financed the venture with him were growing a little skeptical about returns. The risk was greater than they had anticipated. He bought them out. But there was no money left to rebuild and operate. So he went to Grand Rapids, Michigan, and for a year and a half acted as manager for a large lumber concern. As soon as he had saved a little money he came back to Elcho determined to make a go of the lumber business under his own ownership.

Another sawmill was built. He cut 400,000 feet the first year. Hardwood operations were added as a specialty and this went big. He cut 1,000,000 feet the next year, 2,000,000 feet the next and for the next six years the business kept on growing. He went in for community development. Forty or fifty houses were built one year; the store in the village was made over; a hotel was erected. Other towns offered him opportunities. He has more than $1,000,000 worth of standing trees, and now owns four mills at Elcho, Antigo, Birnamwood and Hiles. The lumber operations the past year reached more than 50,000,000 feet. And the business is still growing. The Charles W. Fish Company is just Charles W. Fish. There is in reality no company. He is probably the largest individual lumber operator in the country.

There were other plans for larger development when a fire turned the business section of Elcho into an ash pile last February. These were set aside.

Six months after the fire a Nuremberg village had risen. As planned, a trunk-line highway parallels the railroad through the business section of the village and the connected business houses are so artistically fashioned as to challenge the eye of the traveler on train or by automobile.

On the corner of the site of the former grocery, a department store has been built. Then in the chain follows the bank, drug store, Old Muskie Inn, barbershop, offices for dentist and physician and motion picture house. Some of the business houses in the town, which were not destroyed by the fire, have been remodeled to blend into the general scheme, with redwood siding and artistically arranged shingle designs. Moreover, the depot has been brought into the general plan of harmony, with large convenient waiting rooms and long cement landing platforms.

The so-called "Muskie Inn" is one of the finest hotels for its size in Northern Wisconsin. It has fifty-five rooms built around an open court, sixty by thirty-two feet, which gives light to a dining room of the same size. The lobby room of the hotel is finished in brown with Dutch blue in carpet and drapes. There are two stairways on opposite sides leading to the guest rooms.

Fish's community house is one of the show places of the village. It is said to be one of the three most attractive in the state. The building is 100 by 130 feet and from the large veranda a row of French doors open to the lounge, reception and cloak rooms. Large fireplaces piled with logs blaze a welcome in the early autumn. All of the conveniences, common to clubhouses, are to be found, from billiard rooms to bowling

More Humane Prison System Urged for England

New Movement Under Way, Aided by Lectures of Thomas Mott Osborne

By W. P. CROZIER

OF THE lecturers who have come to England none has been more "acceptable" (to use a word often applied here to preachers) than Thomas Mott Osborne, one of the pioneers of prison reform in the United States. He would have been heard with interest in any case, but, as it happens, there is a new movement now gathering force in England for the reform of our own system and Mr. Osborne's visit came at a time when there was special interest in the American experiments. For though American prisons no doubt have their defects, there is no question that American reformers are in advance of us, both in studying the psychology of the offender and in searching for the reformative principles which ought to be applied to him. For a good part of last century both countries were on the wrong track, using the prison almost entirely as a punitive engine pure and simple. Both countries are gradually coming to take a different view, only there has been quicker change and much more experimental work in the United States.

In England we have had, broadly speaking, two great stages in the history of our prison system. In the first, which covered the eighteenth and the early part of the nineteenth century, the prisons were, as we should now think, a shame and an abomination.

Operated Jails for Profit

THE root of the evil was that they were managed for private profit by the gaolers. This system inevitably led to every sort of abuse—to overcrowding, blackmail, prostitution, drunkenness, disease and death. Of the gaolers it was written that they were "low-bred, mercenary, and oppressive, barbarous fellows who have less regard for the life of a poor prisoner than for the life of a brute." Said another writer: "The felons in this country lie worse than dogs or swine and are kept much more uncleanly than those animals in kennels or sties." These were the days when gaol fever, or typhus, was not infrequently communicated by the wretched prisoners to those about them at the Assizes, so that once, at the "Black Sessions" at the Old Bailey, London, four of the six judges on the bench died of the fever, together with some of the counsel, several of the jury and some forty others of those present. The *Gentleman's Magazine* declared that so hideous were the conditions of the prisons that "thus perish yearly five thousand men, overborne with sorrow, consumed by famine or putrified by filth, many of them in the most useful and vigorous part of life." Most of these unfortunate beings were not criminals or felons at all, but only debtors.

How came such a system to continue, when its existence was not only known but was actually exposed publicly both by individuals and by Parliamentary inquiries? No doubt because, as John Howard, the greatest of English prison reformers, said at the time, the general attitude of the respectable and comfortable citizens toward these wretched prisoners was embodied in the curt sentence, "Let them take care to keep out." That is the reason that much that is mistaken, though well-intentioned, in our present system, has been allowed to persist down to the present days. There is a general opinion among the easy and law-abiding citizens that if a man for any cause gets into prison, society is well rid of him and he deserves all that he gets.

Nevertheless, the old system was so repugnant to every feeling of justice and humanity that it was abolished, though—discreditably enough—only by slow and painful stages. John Howard demanded sound and sanitary buildings, gaolers who should be salaried servants of the public, a proper inspection of the prisons and a régime which should aim not only at punishing but at reforming the prisoners. Eventually what he demanded came, but in one direction the reforms ran to extremes and our prisoners have been suffering ever since for the mistake then made.

One of the great evils of the old system was the promiscuity of all ages and sexes which accompanied it. This spread disease and vice and manufactured criminals. The reform movement of the time thereupon advocated separation of prisoners. Hard work there was to be and hard work, too, of the most painful, exhausting and soul-destroying kind. Of this the treadwheel was the type. But it was to be accompanied by much solitary confinement in the cells and by the "perpetual silence" rule. Those are the two features of the system which have come down to us today. In general, the prisoner spends seventeen or more hours out of the twenty-four in his own cell and perpetual silence is enforced.

The aim of those who have applied these two principles was humane. They desired to cut the prisoner off from receiving or spreading contamination and to prevent him from becoming of the "criminal type." He was to be allowed by inward meditation to reform himself. These are still the main principles which inspire our prison system. But it is the opinion of the unofficial inquiry committee which has just reported on the prison system that they are not and never have been humane, that they are based on a wrong psychology, and that they are fundamentally bad in their effects. This committee insists that "of the specific features of the present system most responsible for the prisoners' mental and moral deterioration, the silence rule and the rigid separation are the most important. The present operation of these rules, so far from serving a useful purpose, is productive of mental abnormalities and of serious moral results." Sir Sydney Olivier describes the system as one which insures that if we release our prisoners we shall have to imprison them again "and continue the process of their destruction till nothing but animal life can be said to remain to them."

The root of the criticism is that in despite of great material improvements—better buildings, food, sanitation and the like—our system is still cruel and brutalizing. It has ceased in the main to inflict punishment of the body but it has substituted the punishment, much more terrible, of the mind. It cuts the prisoner off from all normal human activities. Man is a "social animal," but prison throws him back entirely upon himself. It subjects him to a narrow, rigid, unreasoning discipline, denies him initiative, spiritual interests, mental diversion, and turns him into an automaton.

The prisoner either does or does not adapt himself to this system. If he does, he surrenders his own will power, grows rather to like the régime which decides everything, down to the minutest detail for him and as often as he is released from prison he drifts back to it again. If he does not adapt himself, an even worse fate of mental breakdown, partial or whole, may probably await him. Such a system treats all prisoners as though they were persons of a uniform mentality, ignoring the now admitted fact that much crime springs not from vicious impulse but from mental deficiency, disease, poverty or defective education and in many cases ought to be treated not by the gaoler but by the physician and the schoolmaster.

Let me mention some other principal criticisms before explaining how far we in this country have traveled on the road of reform. One is that the Prison Commission, which is the national governing body, works in secrecy, has few reforming ideas of its own and dislikes those of others, has insufficient personal touch with prisons and prisoners, is subject to no pressure of independent inquiry or opinion and is much too well satisfied with things as they are. The systematic study of prison psychology is only just beginning. So are the conferences of all the people with knowledge and authority, official and unofficial, through which reforms might be suggested and discussed. On this subject the inquiry committee says enviously, "In the United States, in particular, by this method and by the wide powers of experiment and investigation vested in the staff, a flood of light is being poured upon the psychology of prisoners and the possibility of rehabilitating 'incorrigibles.'"

The Discipline of Prison

OF COURSE, much depends on the aim. If we intended to use imprisonment as a means of educating the criminal into being a criminal no more, we should not impose upon him labor that is purely punitive, does not fit him for any useful work in after-life and is always done under minute and degrading supervision (we have nothing like the American experiments in "mutual welfare" and self-government.) We should not deny him such invaluable means to self-expression (which means the keeping of the soul alive) as small hobbies, or a good supply of books, or a reasonable allowance of letters and of visits. We should not impose harsh punishments for breaches of prison rules nor by flogging create, as one of our doctors has said, "two brutes (the flogged and the flogger) instead of one." (Flogging, by the way, has diminished very greatly of recent years—and for a significant reason: the more prison discipline has been eased, the fewer have been the offenses of violence by prisoners which entailed the flogging penalty!) We should not punish a man by lowering the already meager diet of prison life.

But these things are done unless and until public opinion learns of them and intervenes. Recently a prisoner with a good record escaped from gaol in the Isle of Wight. He was recaptured and sentenced to go in chains for six months. Mr. Bernard Shaw pointed out that the real offenders were the prison authorities who had allowed the man to escape and the public protest against the punishment was such that the home office had to remit it. But the rule stands. Again, it was only after several attempts at suicide had been made by Borstal (or reformatory) youths that the home office announced the discontinuance of punishment in the form of restricted diet.

Now for the steps that we have already taken toward a humane system. We have the probation system, the object of which is to avoid the manufacture of criminals through prison life out of persons who for the most part have nothing criminal in them, but offend under sudden impulse, or out of poverty, or mental instability or sometimes out of little more than high spirits. But probation is not used enough.

Many Mentally Deficient

THEN we have the Borstal reformatory system for young persons between sixteen and twenty-one years of age. The aim here is to deal with the prisoner individually, to give him a useful training, and to make it possible for him to become a good citizen after his two years or more of detention. The aim is good but the method is at present defective. The chief criticisms are that the régime is too much like that of the ordinary prison—too military and too much beset with warders taken from the old convict prisons.

The most hopeful experiment which we can show is being undertaken at Bradford and Birmingham, where there is a court doctor to whom the magistrates refer for observation and report any person "exhibiting mental instability or abnormality or repeatedly committing the same offense." The work of observation is carried on sometimes in a place of detention, sometimes at the prisoner's home. The results at Birmingham have been very striking.

"Investigation has shown that the criminal is to a large extent defective mentally and physically and proper medical advice may in many cases remedy his defect and make him a decent member of society."

In one year 151 cases were referred to the prison doctor, with the following result:

39 of the offenders were sent to prison,
16 " " " " placed on probation,
59 " " " " dismissed or their cases indefinitely adjourned,
15 were found to be insane,
14 " " " " mentally deficient.

The Freest People in the World

Concluded from page 3

his life and habits? Does not the Yankee provide the amusing phonograph for his music and entertainment? Does not the Chinaman make silk for him to wear? Does not the Englishman give him tobacco and kerosene for his lamp? Does not the Frenchman provide perfumes and sweets?

Suppose the Bedouin's forefathers did show the Westerners how to do these things, is that fact not enough? The wily Bedouin grins and lives his life and lets other men work as much and as hard as they please.

Mr. Simpich finds it a rather astonishing thing that in his palace, in the forbidden city of Mecca, the Grand Shereef sat him down and wrote a telegram to the assembled representatives of the nations at Paris and Versailles, during the Peace Conference asking that Arabia be admitted into the family of nations. Here was Mohammedanism making friendly overtures to Christendom! Slightly before this, when General Allenby was leading his forces into Jerusalem, Bedouin troops calmly quit the Turkish army and joined with the British in the delivery of the Holy City into Christian hands. "Shades," says Mr. Simpich, "of Peter the Hermit and Lion-Hearted Richard!"

We agree with him that this was indeed strange. We can see that it might have been taken as a sign of repentance and conversion on the part of the Arabs. However, when Mr. Porterfield inquired into the matter, he found that the Bedouin tired of fighting with the Turks and said to himself, "I'll try fighting with the Englishman. He is an agreeable fellow, and perhaps will admire my fighting style greatly."

Fighting with the Turks was an intermittent affair with him. He didn't work at it regularly, but only when fighting happened to suit his fancy. When he went over to the other side and fought with the British against the Turk, he carried on in the same manner, grinned in pleasure when he was hailed by the Englishmen as a great, brave man and, when he tired of the game, quit and went back to his desert.

Mr. Porterfield tells this story of one sheik, in particular, who greeted an English officer in a friendly manner at his camp one day, invited him in and, in his native politeness, extended him coffee, the nargile and what other courtesies he could.

The visitor explained as tactfully as he could that he had come on a mission of tax collecting.

The sheik could hardly believe it. He laughed and told his caller that he was a droll fellow. The tax collector protested that he was not joking—that he was quite serious in demanding taxes.

"But I pay no taxes!" exclaimed the sheik, "Of course I pay no taxes. You are a pleasant fellow, and I am friendly toward you, but I pay no taxes."

The collector good-humoredly said that of course the sheik must pay, tried to explain the theory of the matter, the "justice" of it, and departed.

The following night he was called to the gate of the city by a messenger who said the sheik wanted to see him. The Briton set forth, accompanied by a guard. The sheik, mounted and accompanied by a small band of men, inquired again if the British Government was serious in demanding taxes from him. The officer said that the British Government was.

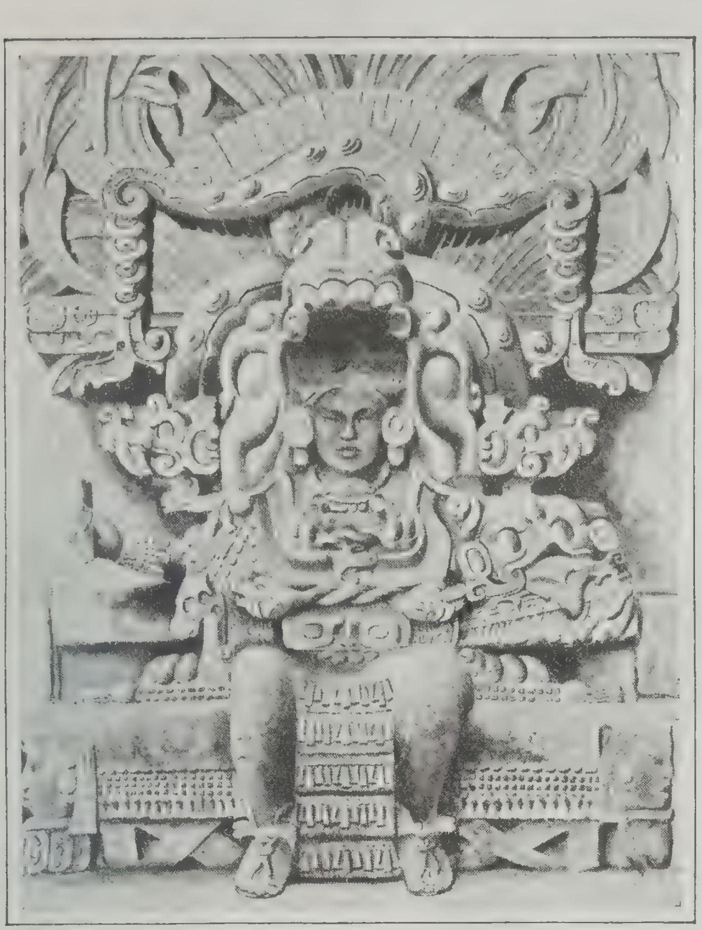
The sheik was annoyed and grieved. He presently became abusive and ordered the tax collector to go back to his office and to stay there and to make no more attempts to collect taxes. The Englishman, becoming somewhat nervous, made a move to arm himself with his revolver. The Bedouin promptly shot him. The guard also made a false move and also was shot. Whereupon, the Bedouins wheeled their horses and their white robes flying behind them, galloped away into the desert.

What can be done with such a people? Collect taxes by force? Those who know the Bedouins are skeptical as to whether the British will ever be able to make these desert men pay.

Meanwhile, the Bedouin lives as he has lived for centuries, indifferent to what the outside world thinks of him, knowing that he does at his own bidding and at no other person's, and remains a free man—an exceedingly free man. He is free of civilization's bonds, but he is free of civilization's comforts, too.

If you told him that, he probably would answer, "But that is none of your affair. My life, as it is, suits me."

No Legends Linked With Pre-Aztec Sculptures



Huge statue on the hieroglyphic stairway at Copan, Honduras, excavated by G. B. Gordon. The headdress is restored from the fragments found lying on the steps.

Ancient Carvings of Central American Artists Have No Stories; Must Furnish Own Themes

By WILLIAM A. M'GARRY

DISCOVERIES in the Valley of the Kings in Egypt leading to contrasts between the art of ancient Egypt and that of the earliest American civilizations furnish the opportunity to point to and outline a movement which, in the opinion of some authorities, is destined to change the whole American attitude toward art, ancient and modern. In the great museums and institutions of education throughout the country a deep resentment is stirring against the use of European or Asiatic standards of measurement for the early and modern art of the United States and all the countries of the New World. For many years it found no expression, but now it is being openly championed by men and women who are in a position to influence the views of the rising generation of artists and art lovers.

One of those whose work was described in this magazine is a woman and American born. She is Mrs. Lucy Langdon Williams Wilson, principal of the Southern High School for Girls in Philadelphia and noted authority on the effect of climate on races. Her husband is Dr. William Powell Wilson, director of the Philadelphia Commercial Museum, for which institution Mrs. Wilson has conducted most of her archeological expeditions. Unlike many explorers, whose explorations are made solely for the purpose of getting exhibitions of the handiwork of forgotten civilizations, Mrs. Wilson's primary scientific interest has been ethnological: the attempt to determine the climatic and other reasons for the disappearances of great races and nations of the past.

The other authority to be quoted is Dr. George Byron Gordon, director of the University Museum in Philadelphia, himself an explorer of note. It is interesting to find Dr. Gordon insisting on the use of strictly American standards in judging the value of early and modern American works of art, since he was born and spent much of his life in England. He is perhaps the leading authority on the art history of London and its ethnological development. In the nature of his work he has become familiar with all the art of all times, to greater or less degree. If there was anything to the mystery with which some teachers attempt to surround art it is only reasonable to assume that he should have discovered it. His refusal to accept art as something beyond the common understanding is perhaps best summed up in the following statement:

"One of the vital truths made clear by collections that illustrate the history of the arts is the essential identity of art and craftsmanship. The sculptor, the painter and the story teller, in their work and in their achievements, share the same traditions as the mason, the goldsmith and the weaver. Whenever, in the world's history, this identification was an accepted fact, when a close association between art and craftsmanship marked the order of things, when the atelier was the workshop, when the artist and the craftsman were one, then great works were wrought and great names were handed down. Whenever an artificial distinction arose, art, entering a barren field, became the subject of affectation, and craftsmanship was debased. Such a distinction does not correspond to any reality of life.

"Donatello carried throughout his career the consciousness that he acquired during the years of his apprenticeship to a mason. Michelangelo claimed that he was a sculptor because his wet nurse was a stonecutter's wife. When artists attempt to set up among themselves an exclusive cult based on a belief in some form of special dispensation, it means that art is dead. When artists will forget to think of their occupation as a thing apart, and of themselves as distinct from mankind; when they discover that they are craftsmen and belong to the great company of masons and goldsmiths and carpenters with Donatello and Ghirlandajo and Michelangelo, then they will get back their great traditions and come to their own again. The artist is known by his handiwork; in this alone his gift reveals itself. The good artist is the good workman and the good workman is the good artist. No freak ever was a good workman.

"It would be a good thing to consider seriously this true saying in its relation to the art and the craftsmanship of the present day. It would be a good thing, too, to consider it in its obvious relation to the workman himself and to inquire whether he has anything in his outlook as good as the clean ideals and constructive aims of the past. Such an inquiry will not fail to show that destructive methods, undoing the old traditions, will extinguish the soul of the artist and leave his vessel stranded. Methods that lower the tone of his handicraft will in no way help the workman or contribute to the happiness of his lot."

The University Museum now has an expedition in Central America studying and excavating the ruins of ancient civilizations, and it is hoped that it will succeed in proving the assertion of Dr. Gordon that even when there is a similarity between early American and early Egyptian art, it is not due to borrowing. "Among the ancient peoples with advanced civilization in Mexico, Central America and Peru," he says, "the native artistic tradition blossomed independently under local influences. In each of these favored spots it put forth fruit abundantly, acquired a vigorous growth and attained to high levels. In none of these places has this flourishing condition of the arts survived into our own day. The ancient art of Central America and Peru and Mexico is extinct as the art of Egypt is extinct.

"A candid view of artistic expression from the historical side calls for a recognition of ancient American art as a part of the world's inheritance. It stands entirely on its own merits and holds its own in spite of its isolation. Although comparison brings out many interesting parallels and equally interesting divergences, it is not necessary to talk about American art in terms of equality with the art of other continents. To do so would be to strain the uses of language, but it may be admitted at once that ancient American art has its own lessons and in some at least of its local developments was not lacking in elements of greatness. In one department this is best exemplified by some of the sculptures of Central America.

"Unlike the storied sculptures that elsewhere in the world have come down from antiquity, these Central American sculptures have no clear surviving tradition traveling down the centuries with them or running on before. They have survived the hero tales of their lost Iliad. Their interpretation depends not on legend, not on the fancies of contemporary writers and not on any side light that history affords, but on the force of their own unaided message and on the eloquence of their own appeal. It depends on the language of the sculptor and it depends on our own understanding of and sympathy with that language. We do not know what became of these artists or of the things to which they bore witness, but we believe that they honestly tried to paint these things as they saw them. They went down, I presume, before some superior force. It may have been the Aztec or it may have been the fever.

"Some years ago it was my fortune to excavate a great stairway buried deep beneath the debris fallen from the ruined buildings that the builders had reared on the height above. That stairway had once been the grandest sight in the ancient city of Copan, in Honduras. With its elaborate balustrades, its total width was thirty feet and its steps had numbered nearly a hundred. Every stone in that great stairway was carved and wrought in harmony with a consistent design in which the conception of the architect unfolded itself in one daring and monumental plan. The masonry was carved after the stones had been placed in position. I am going to make use of one of its details to illustrate some of the properties and attributes of Central American sculpture. That detail is the figure of a man, life size or more, built into the stairway as a part of its central structure in such a way that the figure appears seated on a step high above the huge and elaborately sculptured altar or dias that was built into the base, projecting in front of it and rising from the pavement below.

"There had been a number of these seated figures, one above another all the way to the top, but only one remained in position. It was composed of several blocks of stone that had been carved after having been put in position. The sculpture was in very bold relief, but the right arm with its hand was carved in the round and stood free. The figure when found had suffered some injuries. The object held in the right hand was broken away. The face was destroyed and the upper part of the headdress had fallen. This part, however, was recovered during the excavations and could easily be replaced.

"I take it that the person shown in the statue was a man of importance, and that the artist meant to convey that

When Logan Spoke the Whole World Heard

Oratorical Gem of Indian Chief Carved in Stone; Tree a Shrine

By EMERSON ROBINSON

AN UNTUTORED Indian chief, standing in the "forest primeval," bursts into savage eloquence. His audience is one man. His speech becomes a classic, challenging the admiration of a cultured world. The tree under which he speaks becomes a shrine, to which thousands go each year. It is guarded by a state, jealous of its historic treasures, and preserved—why not?—by a Providence which culls the masterpieces of today for the glories of tomorrow.

Logan's Elm, which was ancient when the famous Indian chief, Logan, uttered his philippic against the whites in 1774, still is standing some ten miles from Circleville, Ohio. It has weathered the storms of no one knows how many centuries. It is not so sturdy as it was a hundred years ago but, barring unusual storms, it should stand for a generation or more. It was damaged considerably in a terrific blast of wind in 1921, but these winds come seldom in that part of the country.

Lord Dunmore, governor of Virginia in 1774, led an expedition against the Indians in Ohio and following the campaign settled down with his aides to make peace at what is known as Camp Charlotte in the central southern portion of the state.

Chief Cornstalk was there, as were numerous other leaders of various tribes, but Logan, chief of the Mingoes, refused to attend. Lord Dunmore especially wanted his signature to the pact and he sent John Gibson, a friend, for him. Gibson met up with Logan in the forest near what is Circleville. They walked for a short distance and then stopped under a gigantic elm tree, Logan the meantime refusing to see Lord Dunmore. It was under this tree that Logan spoke his famous message:

"I appeal to any white man to say, if ever he entered Logan's cabin hungry and he gave him not meat; if ever he came cold and naked and he clothed him not. During the course of the last, long and bloody war, Logan remained idle in his cabin, an advocate of peace. Such was my love for the whites that my countrymen pointed as they passed and said, 'Logan is the friend of the white man.' I had ever thought to live with you but for the injuries of one man. Colonel Cresap the last spring in cold blood and unprovoked murdered all the relatives of Logan; not sparing even his women and children. There runs not a drop of my blood in the veins of any living creature. This called on me for revenge. I have sought it. I have killed many. I have fully glutted my vengeance. For my country, I rejoice at the beams of peace. Yet do not harbor the thought that mine is the joy of fear. Logan never felt fear. He will not turn on his heel to save his life. Who is there to mourn for Logan? Not one."

It was recorded at that time that the speech was delivered after Logan had burst into tears on recalling a recent massacre of some of his kin.

Gibson immediately reported the speech to Lord Dunmore and within a few months, even in those days of slow communication, it had become one of the classics of the colonies. In a few years it had spread through Europe and other civilized nations and as early as 1781 Thomas Jefferson said that "I may challenge the whole orations of Demosthenes and Cicero and of any more eminent orator, if Europe has furnished any more eminent, to produce a single passage superior to the speech of Logan, a Mingo chief, to Lord Dunmore."

The years rolled by and a young professor began the compilation of a series of readers. He sought the finest in literature as an aid to molding the character of the young. William McGuffey found this impassioned outburst of Logan and he gave it prominent place in one of his books. In this reader it was memorized by millions of American school youths and in honor of this tribute the McGuffey Society of Ohio often holds its annual gatherings under the pleasant shade of the Logan Elm.

Theodore Roosevelt learned it as a student and it stuck with him and when he became famous he, too, added his word to its worth: ". . . . will always retain its place as perhaps the finest outburst of savage eloquence of which we have any authentic record."

Alfred Lee, in Randall and Ryan's history, says:

"Taken in connection with the circumstances which are said to have inspired it, this is one of the most pathetic deliverances in all literature. In brevity, simplicity and directness of appeal, it bears a striking resemblance to Abraham Lincoln's dedicatory address at Gettysburg."

Logan's Indian name was Tahgahjute, meaning, it is said, Short Dress. When he was a stripling he went with his father, Chief Wingohocking from the country of the Mingoes to visit James Logan, a scholar, philosopher, one secretary to William Penn and later representative of Penn and Chief Justice of the Pennsylvania colony. Gibson was known as the friend of the red man and the friendship was reciprocated.

Wingohocking and Logan exchanged names, that of the white man being given to the chief's son and the name of the chief being given to a small stream which flowed in the vicinity of Stenton. With the naming of the rivulet, Logan remarked that 'Long after we have passed away it shall still flow and bear thy name." And it is to this day so known near Germantown.

Logan, the Indian, is described as being tall and dignified and in his younger days very handsome. He had a benign countenance and a fine disposition and his relations, for the most part, were very friendly with the invading white settlers.

In April, 1774, a band of soldiers under the command of Michael Cresap set out to attack Logan and his family, but before they had gone far, Cresap became convinced that Logan was not responsible for depredations which had been committed, and persuaded his companions to return.

But there was another soldier, Daniel Greathouse, who did not believe as Cresap believed and with a party of whites, he invited a number of Mingoes to be his guests at a tavern along the Ohio River. This party occurred on April 30, 1774, according to Shetrone's chronicles; the Mingoes were repeatedly treated to firewater, and it was not difficult for the whites to provoke the Indians to an attack. In the fighting which followed, all but one or two of the seven or eight Mingoes were murdered. One of the victims was a sister of Logan. She was fatally wounded but the life of her infant babe was spared on her pleas for mercy for it. Another of the victims was a brother of Logan. At the time of the massacre, Logan was hunting in Western Ohio.

Where Indian Chief made his pathetic speech. The circumference of this tree, three feet from the ground, is twenty-one feet, six inches. From the tip of the largest limb on the north to the largest on the south, the measurement is 142 feet. East and west, similarly measured, is 122 feet, six inches.

Logan's life seemed to be changed after that. He became bloodthirsty and wreaked vengeance on the whites wherever he met them. It is said that within a very short period he had killed thirty of them. The chief was under the misapprehension, as indicated in his oration, that Captain Cresap was responsible for the outrages, but the murders so angered Cresap that he threatened Greathouse. For years afterward, however, the name of Cresap was anathema in Indian homes and mothers used to quiet their babes by saying Cresap would get them if they didn't stay quiet.

Lord Dunmore, governor of the Virginia colony, was loyal to the mother country. He heard reports of a confederation of Indian tribes in Ohio, Virginia and Pennsylvania, headed by Cornstalk, an aggressive Shawnee chieftain, organized for the purpose of driving out the white settlers. Dunmore determined to make war on them.

Dunmore's chief lieutenant was Andrew Lewis and each leading an army, started westward. In October, Lewis refused to obey an order of Dunmore to join him north of the Ohio River, for he was on the trail of Cornstalk and his band and wanted battle. He met up with the Indian warriors at Point Pleasant, Virginia, or what was then Virginia. It has been variously described by historians as the bloodiest, fiercest and most important battle in the annals of Indian warfare and the whites won. It kept the Indians from aiding the British for at least two years.

Even after the battle Lewis refused to join Dunmore's troops and the governor further invaded Ohio in his effort to obtain a treaty of peace with the Indians. Dunmore sent General John Gibson, who was reputed to be a friend of Logan and father of his sister's child, to Logan who consented to talk. He refused to attend the council but made his simple address which promises to carry through all the future. After the address was given, Gibson wrote it down. Some historians say Logan spoke excellent English; others that the speech had to be translated. Gibson said he spoke in English and that he put his exact language on paper.

Logan later drank heavily and became a wanderer. He abused his wife, and his nephew, in a fit of anger, killed him near Detroit in 1780.

For a century and more the tree under which Logan spoke remained without special importance in the life of the surrounding country.

With the organization of the state archeological society, however, steps were taken to preserve the plot and the tree, and it was obtained by gift in 1911. Monuments surround it and these commemorate the immortal address of the untutored savage and the treaty of peace with the Indians. The speech itself is carved in stone. There also is a monument for Colonel Cresap, accused wrongly by Logan, and later to become a trusted lieutenant of Washington and to rest forever in Trinity Churchyard of New York, where lie so many of the patriots of 1776.

No Legends Linked With Pre-Aztec Sculptures

Concluded from page 11

impression. There is here certainly a dignity and repose that suggests the person of a king. The result was not achieved, however, by resorting to simplicity or by relying on the possibilities of the human figure alone and unaided. The artist had another method and he justified that method by his result. He added all the attributes that belonged to his subject's rank and dignity down to the minutest detail. In this he scored a triumph, for he succeeded in putting on all the trappings pertaining to the sovereign rank of his subject without making his figure either fantastic or absurd, but in such a way that every added detail does honor to his craft, emphasizes the nobility of his labors and gives greater glory to the statue.

"In this use of emblematic motive and insignia the artist faced a difficult task which he performed with much skill. There were no soft, persuasive folds and no flowing robes to cheer his heart and challenge the dexterity of his fingers. Stiffness was the quality that he had to deal with in the dress and ornament and he dealt with that quality quite frankly and honestly. That he could also handle flowing lines and allow himself the freedom and movement that these natural conditions afford, is proved by his joyful treatment of the plumes in the headdress. But he went further both in realism and in symbolism than the drawing, even with its restoration, implies. It does not tell the whole story. It gives but a faint idea of that figure when it was entire. The artist had recourse to an expedient apart from the work of his chisel. He was also a painter and the statue in its original condition was, like the whole of the structure of which it formed a part, a mass of color, the different parts being picked out with the brush in tones that were appropriate to them.

"There are only two or three details of the sculpture that I will attempt to describe. It will be seen that the head is protected by the gaping jaws of a monster or dragon in such a way that the features of the man appear to look out from the creature's mouth. The upper jaw, with its row of teeth, projecting snout and curved nostrils, is carried well forward above the crown; the lower jaw, also armed with tusks, protects the chest. Above and about these monstrous jaws is disposed the most extraordinary feature of the entire figure. It consists of a pair of rattlesnakes with their bodies intertwined. The heads of these two serpents look out horizontally on either side of the dragon's head and take the place of its ears. The well modeled serpent bodies are turned sharply upward and curve around the contour of the dragon's head. They are carried over the top till they meet above the crown. At this point they cross each other and are then bent back symmetrically till they cross each other again in reverse and are then carried horizontally to right and left with a graceful curve. Each tail ends in a curl from which the rattle hangs perpendicularly on either side of the dragon's head."

It was not alone in portraiture that they excelled. The University Museum has a vase from the Uloa River, in Honduras, made of pure white alabaster. The walls of it are only one-eighth of an inch thick, although the vessel is more than a foot high. These ancients also had mastered the art of pottery, as shown by a colored vase from Guatemala. It was made of a fine paste and baked, after which the outer surface was covered with a yellow paint, to which was imparted a high finish resembling a dull polish, probably obtained by rubbing. Decorations then were painted on that surface in red, black, white and sometimes yellow, mythological subjects being most frequently represented.

It has been noted by many explorers that the ancient craftsmen of the Mayas often confused the right and left hands in their drawings and sculptures. That, according to Dr. Gordon, was not peculiar to the Central Americans. He recalls a panel representing one of the saints, painted by a French artist of the fifteenth century, in which both of the feet are right feet. In a noted Chinese painting both of the feet are left feet. According to some authorities mistakes of this kind were made intentionally and were introduced to avoid making a perfect work that might offend the gods. The artists of ancient Byzantium did the same thing.

"The Key of Libberty," a Document of 1798

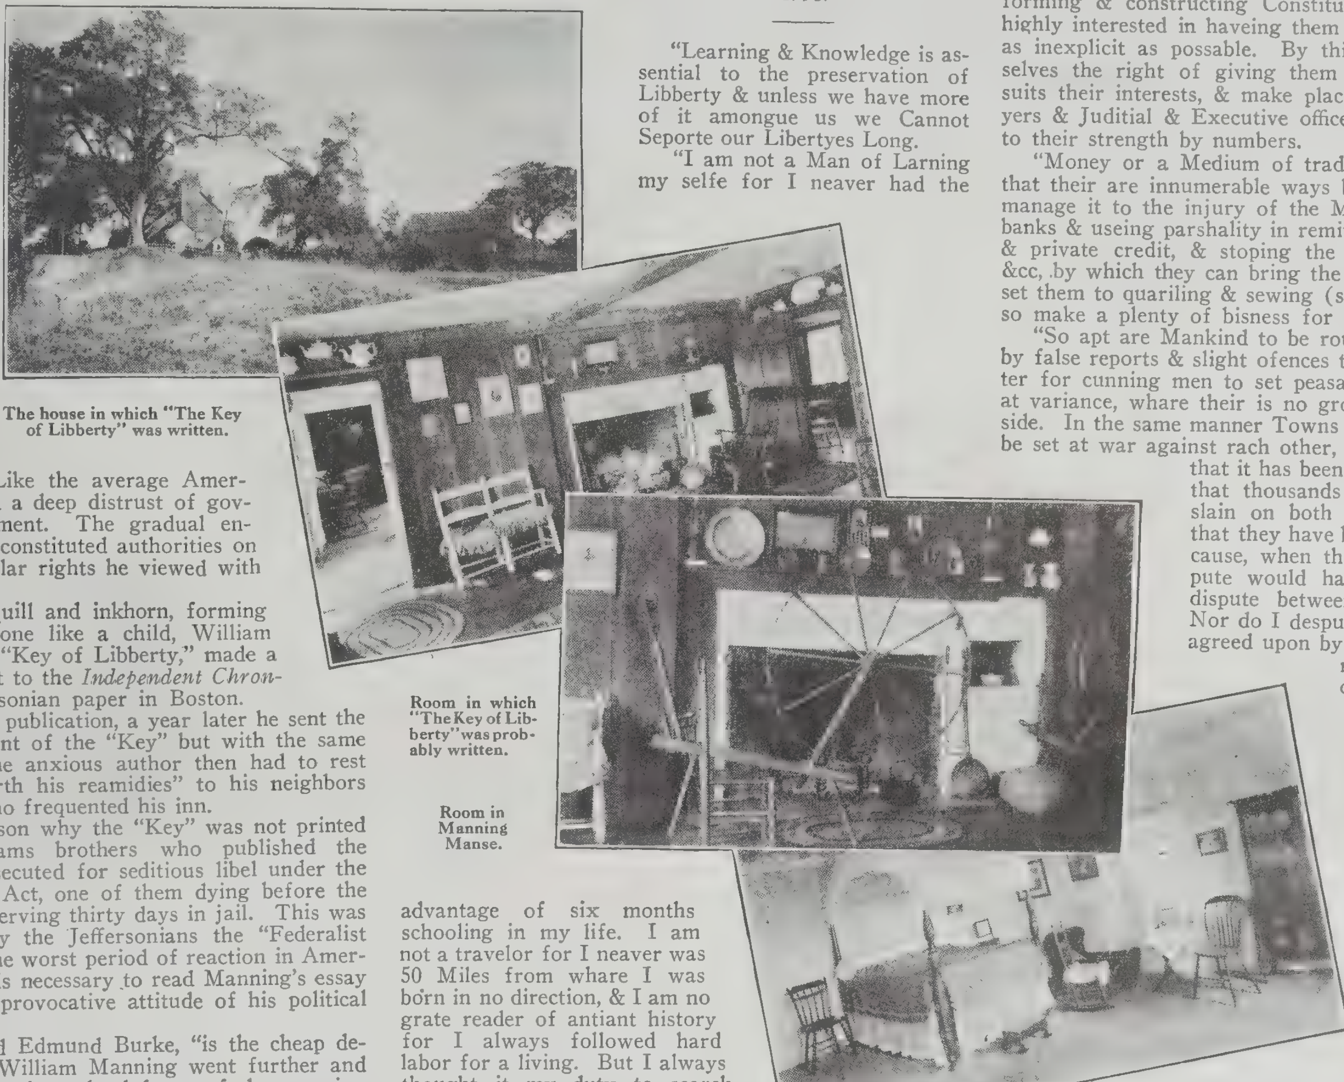
Profound Political Thoughts of Revolutionary Occupant of Bay State Manse

By JOHN BASIL BARNHILL

IN THE Old Manning Manse, near North Billerica, Massachusetts, built in 1696 by the Puritan Manning who came over from England, was discovered recently a remarkable political document, bearing the date of February 20, 1798, written by William Manning, the Revolutionary occupant of the Manse. This manuscript, bearing the title "The Key of Libberty," failed to secure publication in its day but is worthy of the careful study of the present generation.

Professor Harold J. Laski, formerly of Harvard, at present of the University of London, and one of the highest authorities on the history of political theory, has said that with the sole exception of England of the Commonwealth, no community in modern history has been so fecund in political thought as America in the Revolutionary period.

Manning's essay is a rich mine of original thought on the hidden springs of political action. The student who is anxious to get at the very roots of our nation's history is distinctly the gainer by the rescue from its century-long slumber of this virile product of the plain living and hard thinking of the patriot-farmer of the Revolution.



The house in which "The Key of Libberty" was written.

Room in which "The Key of Libberty" was probably written.

Room in Manning Manse.

Manning Manse.

William Manning, who was twenty-seven years old at the time of the battle of Lexington, was a sergeant in a company of minutemen but his company reached the battle too late to take part in it. He died in 1814. In politics he was an out-and-out Jeffersonian. Like the average American farmer, he had a deep distrust of governors and government. The gradual encroachments of the constituted authorities on the domain of popular rights he viewed with dismay.

So with goose quill and inkhorn, forming his letters one by one like a child, William Manning wrote his "Key of Libberty," made a fair copy and sent it to the *Independent Chronicle,* the only Jeffersonian paper in Boston.

Failing to secure publication, a year later he sent the editor an abridgement of the "Key" but with the same disappointment. The anxious author then had to rest content to pour forth his reamidies" to his neighbors and the travelers who frequented his inn.

Possibly one reason why the "Key" was not printed was that the Adams brothers who published the *Chronicle* were prosecuted for seditious libel under the Alien and Sedition Act, one of them dying before the trial and the other serving thirty days in jail. This was the period called by the Jeffersonians the "Federalist Reign of Terror," the worst period of reaction in American history, and it is necessary to read Manning's essay in the light of the provocative attitude of his political opponents.

"Education," said Edmund Burke, "is the cheap defense of nations"; William Manning went further and declared that it was the only defense of democracies. This, indeed, is one of the principal contentions of his "Key of Libberty." Implicit in Manning's writings also was another profound thought uttered by Burke: "The revenue of the state is the state." The Hamiltonian edition of the British system of finance, the justice of which is a question yet to be settled, was the special black horse of Manning and all the Jeffersonians. Manning expressed himself as follows on the Funding System of Hamilton—we feel no inclination to apologize for the patriot's grammar and spelling, but rather to marvel that he does so well considering his manifold handicaps:

"The funding sistim was established by Congress before we ware equilli represented their. Notwithstanding it was always opposed by a very large number, & after a long & warm debate was agreed to by a majority of ondly one, 40 against 41, & by raking up all the State debts & the old Continental mony from its tomb, mounted it up at near Eighty Millions of Dollers, when according to the opinnion of the other side their was not much more than twenty millions justly due, & we have alreadi paid near forty millions Interest on this debt, the one halfe of which would have eniulated (annihilated) the hole debt.

"Consiquently what we have already paid & have now to pay comes to a hundred million of dollars that the public never received nor the possessor never gave a single farthing for, & seposing that their is 4 million of persons belonging to the United States, it is 25 Dollors apeas for each man, woman, & child to pay, & seposing their is as many women as men & all of it assessed on the males, makes it 50 dollers apeace, which according as taxes are leaveled in Masachusets it would come to near two hundred dollars apeace for common or midling farmers to pay. And this is not halfe the dammages of the funding Sistim, for it is ondly made a pretext for all the imposed dutyes, excises, & land taxes that are laid upon the peopel, when the real intent is to make places for numerous sets of officers with high saliryes & fees to colect them & is always so managed that it takes the hole Revenue to pay the interest & seport government, and seldome doth that. For it is a declared fact that Warshingtones eight years glorious administration, (while the Country was in as prosperous circumstances as ever they was or ever will be) run us above eight millions of dollers into Debt."

The following quotations from Manning's essay present other striking points in it:

THE KEY OF LIBBERTY.

SHEWING THE CAUSES WHY A FREE GOVRENMENT HAS ALWAYS FAILED AND A REMIDY AGAINST IT. ADRESSED TO THE REPUBLICANS, FARMERS, MECANICKS, AND LABOURERS IN THE UNITED STATES OF AMERICA.

By a Labourer.

FINISHED FEBRUARY THE 20TH, 1798.

"Learning & Knowledge is assential to the preservation of Libberty & unless we have more of it amongue us we Cannot Seporte our Libertyes Long.

"I am not a Man of Larning my selfe for I neaver had the advantage of six months schooling in my life. I am not a travelor for I neaver was 50 Miles from whare I was born in no direction, & I am no grate reader of antiant history for I always followed hard labor for a living. But I always thought it my duty to search into & see for my selfe in all maters that consarned me as a member of society, & when the war began between Brittan & America I was in the prime of Life & highly taken up with Liberty & a free Government. I See almost the first blood that was shed in Concord fite & scores of men dead, dying & wounded in the Cause of Libberty, which caused serious sensations in my mind . . . .

"The Reasons why a free government has always failed is from the unreasonable demands and desires of the few. They cannot bare to be on a leavel with their fellow cretures or submit to the determinations of a Lejeslature whare (as they call it) the Swinish Multitude are fairly represented, but sicken at the eydea, & are ever hankering & striving after Monerca or Aristocracy whare the people have nothing to do in maters of government but to seport the few in idleness & luxery.

"For these & many other reasons a large majority of those that live without Labour are ever opposed to the prinsaples & operation of a free Government, & though the hole of them do not amount to one eighth part of the people, yet by their combinations, arts & skeems have always made out to destroy it sooner or later.

"When Revolutions are brought about & free governments are established it is by the influence of a few leeding men, who after they have obtained their object (like other men) can never receiv compensation & honours anough from the people for their services, & the people being brought up from their uths (youths) to reverance and respect such men they go on old ways & neglect to search & see for themselves & take care of their own interists. Also being naturally very fond of being flattered, they redily hear to measures proposed by grate men who they are convinced have done them good services. This is the prinsaple ground on which the few work to Destroy a free government.

"In a free government the few, finding their scheems & vues of interest borne down by the many, to gain the power they cant constitutionally obtain, Always indevour to git it by cunning and corruption, contious (conscious) at the same time that userpation when once began the safty of the userper consists ondly in grasping the hole. To effect this no cost nor pains is spared, but they first unite their plans & scheems by associations, conventions, & coraspondances with each other. The Marchants asotiate (associate) by themselves, the Phitisians (physicians) by themselves, The Minysters by themselves, the Juditial & Executive Officers are by their professions often called together & know each others minds, & all letirary and the over grown rich, that can live without labouring, can spare time for consultation. All being bound together by common interest, which is the strongest bond of union, join in their secret corraspondence to counteract the interests of the many and pick their pockets, which is efected ondly for want of the meens of knowledge amongue them.

"The few have a grate advantage over the Many in forming & constructing Constitutions & Laws, & are highly interested in haveing them numerous, intricate & as inexplicit as possable. By this they take to themselves the right of giving them such explanations as suits their interests, & make places for numerous lawyers & Juditial & Executive officers, which ads greatly to their strength by numbers.

"Money or a Medium of trade is of such a nature that their are innumerable ways by which the few can manage it to the injury of the Many, such as erecting banks & useing parshality in remitances, ruining publick & private credit, & stoping the circulation of money &cc, by which they can bring the Many into destress & set them to quariling & sewing (sueing) one another, & so make a plenty of bisness for their party.

"So apt are Mankind to be rought up into a pashon by false reports & slight ofences that it is an easy matter for cunning men to set peasable familyes & frinds at variance, whare their is no grounds for it on either side. In the same manner Towns States & Nations may be set at war against rach other, & I have no dout but that it has been the case many a time, that thousands & Millions have bin slain on both sides equilly thinking that they have been fighting in a good cause, when the hole matters in dispute would have made little or no dispute between honest neighbours. Nor do I despute but that it has been agreed upon by Rulers of Nations to make war on each other ondly that they might have a pretense to raise & keep up standing armies to deprive their own subjects of their Rights & Libberties. This is a grate object with the few, & when they attain it, It ads so much to their number, strength & importance that they have but little more to fear, and the Many have but little reason to expect that they can maintain their Libertyes Long.

"Toards the close of the late War the Officers of the Continental army ware considerably borne upon, by not being paid according to contract, & many of them thought they were not notified anough in the fraiming the State Constitutions. At the close of the War they formed themselves into a Society by the name of Cincinaty. This Institution caused grate alarm & many pointed publications in newspapers, consider it as a daingerous Body.

"This uneasiness caused them at their first General Meeting to make very assential alterations in their Constitution, which they published together with a very plausible Circular Letter, indevouring in it to make the world believ that they neaver would nor could prove any harme. But from that time their was a continual noys & wrighting from one end of the Continent to the other against the badness of publick credit, & the weekness & insefitiancy (insufficiency) of the Federal Government.

"When the Shais affair (Shay's Rebellion) happened in Masachusets it was heded by one of this ordir & many of the rest of them put under pay to supress it.

"Immediately after, a Convention was called to amend the federal Government (Articles of Confederation) when a hard tusel was made chiefly by this ordir to establish a monorcal government in ordir to have their president made King. But though they failed in that yet by some meens or other they have rigeled (wiggled) themselves into almost all the posts of profit and honour in the federal Government. And from this ordir also origenated the funding sistim, by which those that labour for a living will have millions and millions of dollars to pay, for which the publick never riceived nor the posesor naver gave one single farthing for. Also from this ordir originated the Indian war which has cost us thousands of lives and six millions of dollars without the least advantage to us. . . . .

(*Concluded on page 14*)

Turning the Searchlight on Life Insurance

Concluded from page 2

mands separate treatment; it can only be touched upon in this paper, which is concerned primarily with life insurance, to show how and wherein the public is not receiving a square deal.*

Unfortunately, the Supreme Court has ruled that life insurance is not interstate commerce, and is therefore not amenable to Federal control. On the other hand, when a state has passed legislation to which the companies have objected, appeal has been made to the Supreme Court on the ground of unconstitutionality, and the authority of the state defied.

Nevertheless, in some of the states the insurance companies have been forced to "clean house" to a greater or less extent.

The Scandal of 1905

IN 1905 the operations of the large insurance companies in New York State became a national scandal. The lid was first blown off in the Equitable Life Assurance Society, where the Hyde and Alexander factions were involved in a bitter feud for the control of the company and sensational charges of mismanagement and graft were being freely aired.

The New York Legislature appointed an investigating body, known as the Armstrong Committee, consisting of three senators and five assemblymen, which proceeded to an investigation of the New York Life, the Equitable, the Mutual, the Metropolitan, and the Mutual Reserve Life Insurance companies of New York, and the Mutual Benefit Company of New Jersey.

The investigation was conducted under the direction of Charles E. Hughes, now Secretary of State. The findings of this committee disclosed corruption and extravagance among the large insurance companies which would be well-nigh unbelievable if it were not a matter of public record.

To avoid any appearance of muckracking or sensationalism, we shall do no more than quote herewith from the conservative International Year Book of 1907:

"The report of this committee was submitted in February, 1906. Among the more important disclosures, it was shown that certain of the insurance companies had maintained so-called 'yellow dog funds,' with which to influence legislation affecting themselves and the concerns in which they had invested; that similarly money had been used to buy space in newspapers, in which to print favorable accounts of investigations and prosecutions; that in 1896, 1900 and 1904 the companies had contributed freely to the campaign funds of the Republican party, as well as to state campaign funds at various times; that the funds of insurance companies had been used to underwrite promotion schemes in which the officers of the company were heavily interested; that, likewise, the funds had been involved in highly speculative investments in which officers of the company were interested;

"That in some cases the officers of an insurance company had formed a syndicate to buy stock to be unloaded on the company at an advance, or to be transferred to the company in case of declining value; that the investments of the company were largely made through brokerage firms in which the officers had an interest; that funds were deposited in banking institutions wholly or partly controlled by the officers of the insurance company, and that laws forbidding the holding of industrial stocks as investments were evaded by transferring nominal title to such stock to a group of company employes.

"All of these and similar abuses were more or less directly the result of the accumulation of large surpluses requiring investment. The insurance companies were gradually led into the field of stock and corporation manipulation, largely for the benefit of their foremost officials.

"Another abuse was the granting of enormous salaries to controlling officials, as already noted in the Equitable ($100,000 per year for the first vice-president, and a total of $448,500 per year for thirteen executive officials), and as shown by the salary of $150,000 a year to President McCurdy, of the Mutual, $121,000 to his son as general manager, and $100,000 to the president of the New York Life.

"Then there were other abuses more nearly related to the nature of insurance methods and the character of insurance company legislation. Thus, the efforts of the companies to secure new business had led to great increases in expense of management, especially in the item of agents' commissions. Such commissions commonly consisted of fifty per cent of the first year premium, twenty per cent of the second, fifteen per cent of the third, and seven and one-half per cent of others up to the tenth, and represented more than half the cost of insurance company management.

"As a result, agents frequently secured insurance for bad risks, and granted rebates out of their commissions to relatives or to the influential persons of a community, and both practices in the long run tended to increase the cost of insurance, while the former made more difficult the complicated problem of determining the size of premiums. The investigation shows that the leading American companies pursued the policy of securing new business abroad and also in this country, even when such business represented a loss in the long run. It was also shown that the officers of mutual companies were able to determine the composition of the board of directors by securing command of sufficient proxies to determine an election."

Report of Investigators

AS A result of these disclosures, five prominent life insurance officials were indicted for forgery, perjury, or misdemeanor, and in October, 1907, District Attorney Jerome, of New York, moved their trial in the Criminal Branch of the State Supreme Court. Other officials involved in the scandal were removed by what the International Year Book calls "voluntary exile or premature death."

The report of the investigating committee led to the passage of legislation at Albany designed to correct the worst of the existing abuses. It included the following prominent features:

Insurance companies were forbidden to make campaign contributions.

The agents of corporations lobbying at Albany were required to file with the Secretary of State a statement showing the objects sought by them, and to furnish an account, under oath, of all expenditures made for lobbying purposes.

Life insurance companies and their officers were forbidden to engage in underwriting enterprises of any kind.

Investments in stocks and bonds were forbidden, the companies being given until 1911 to dispose of stocks on hand.

First year commissions to agents were limited to the gross "loading" of premiums.

New policies were not to contain any deferred dividend provision.

The total amount to be paid out in any one year, to secure new business, and the amount of new business to be written in any year, were limited.

The transformation of joint stock companies into mutual companies was encouraged.

A plan for holding elections of directors was prescribed by law.

The existing directorates in mutual companies were eliminated and new ones ordered elected.

The validity of all proxies, old and new, was limited to two months, and lists of policyholders ordered to be made accessible to any patron of the company.

Control Now in Chaos

WHILE this legislation doubtless effected a much needed reform in the operations of the larger companies doing business in New York, the lack of Federal legislation has naturally made it impossible to subject the insurance companies to uniform control throughout the country. Both President Cleveland and President Roosevelt, in messages to Congress, urged Federal control of insurance, but in view of the attitude of the Supreme Court, the only way by which Federal control can be extended over the insurance business would be by Constitutional amendment.

Only last year, in a case arising in Arkansas, which was carried to the Supreme Court, that tribunal definitely denied the right of a state to control the acts outside its borders of an insurance company doing business within the state. Again, in the same year, the Supreme Court denied the right of a state to revoke the license of an outside insurance corporation which appealed from the state tribunals to the Federal courts or which sued a citizen of the state in the Federal courts. We are informed by the International Year Book of 1922 that in the latter case the Supreme Court "reversed its own former opinion upholding a Kentucky law under which the Commissioner of Insurance was required to revoke the license of a foreign insurance company for the same alleged offense."

This is sufficient to show the chaotic state of legal control of insurance at the present time. Forty-eight different states are dealing with insurance legislation, without any recognized uniform standard. It would be interesting to know how much money the insurance interests spend annually for lobbying purposes to defeat what they consider hostile legislation in all the states. During 1921 alone, 4,000 bills of one kind or another relating to insurance were introduced in the various states. ONLY A SMALL PROPORTION, HOWEVER, BECAME LAWS. How, and in whose interests, were the vast majority of these 4,000 bills killed? How much did it cost to kill them, and was the money of widows and orphans used for that purpose?

These and many other questions connected with the insurance business as at present conducted demand a straightforward answer.

---

*The Dearborn Independent purposes, at an appropriate date in the future, to take up incendiarism for profit in articles having to do solely with the fire-bug business.

"The Key of Libberty," a Document of 1798

Concluded from page 13

"When I charge these things to Cincinnaty I do not meen that they did them alone but as planners & leaders in them, for to them also may be charged the organization of allmost all the ordirs of the few who follow after & seport them in their diabolical measures—which I will remark upon seperately as followeth.

"These ordirs of men ar made up prinsaply of Cincinaty, & by the funding sistim have risen like a black cloud over the Continant, & have gained welth like the Nabobs of the East. They have got the princaple command of our funds, & not ondly swindle honest individuals out of their property, but by their bribery & corruption have grate influence in our elections & agitate our publick Counsels. By their land speculations & bribery they shook the government of Jorgia almost to its foundation & agitated the federal Government so that one of the Senetors chellenged one of the Representatives for a Duel, right in the midst of one of the most important debates they Ever was or ever will be ingaged in.

As to Doctors and Lawyers

"THE Doctors have established their Meditial Societyes (the Massachusetts Medical Society was incorporated in 1781) & have both their State & County Meetings, by which they have so nearly enielated (annihilated) Quacary (quackery) of all kinds, that a poor man cant git so grate cures of them now for a ginna (guinea), as he could 50 years ago of an old Squaw for halfe a pint of Rhum. The bisness of a Midwife could be purformed 50 years ago for halfe a dollar & now it costs a poor man 5 hole ones.

"Free governments are commonly destroyed by a combination of the Juditial & Executive powers in favour of the interests of the few, and they do it by construing & explaining away the true sence & meening of the constitutions and laws, & so raise themselves above the Lejeslative power, & take the hole Administration of Government into their own hands, & manige it according to their own wills. The Free Republican in No 9 saith that in many of the antiant Republicks the Juditial power became the mear instruments of tirony, & proposes lawyors as a nesecary ordir in a free government, to curbe the arbitrary will of the Judge. But that appears to me like seting the Cat to watch the Creem pot.

"The Lawyers have established their Bar Meetings & become the most formidable & influential ordir of any in the Government, & though they are nither Juditial nor Executive officers, but a kind of Mule ordir ingendered by & many times overawing both. This ordir of men git their living intirely from the quarrils, follyes, disputes & destresses of the Many & the intricacy of our Laws, & it is from the arts & doings of these men, that the Juditial & Executive officers are furnished with the chief of their bisness & imploy. Consikuintly they are bound together by the strongest bonds of union.

"Many have bin the complantes against the Lawyers in years bak & of the intricacy of our laws, & much time spent & pains taken by the Lejeslature to remidy the evil. But all to little or no purpose, & the soul reason is because we send these fee officers as Representatives to make our laws. Unless the peopel can be brought to calculate more upon the opporation of these little selfish prinsaples on mankind, & purge the Lejeslatures from fee officers, they cannot be governed by laws very long.

"Thus we see all the ordirs of the few completely organised, & they have of late got so monstrously crouded with numbers that it is imposable for them all to git a living by their professions, & being in want of imploy they are aiding in all the plans & scheems of Cincinaty to influence the Many.

"I would not be understood to be against the asotiations of any ordirs of men, for to hinder it would hinder their improvements in their profesions, & hinder them from being servisable to the Many. Their need ondly one Society more being established, or proper meens of information amongue the Many to hinder their being daingerous in politicks. In ordir to promote those meens of information among the peopel their has bin many sociatyes established, by Constitutional, Democracticle & other names, made up of men of Republican prinsaples & grate abilities who did all in their power to inliten the peopel into their true Interests. But for want of the Society I have mentioned, or a proper chanel of conveying their sentiments to the peopel, & by the joint exertions of a majority of the other ordirs I have mentioned to hinder their usefulness & pregidis (prejudice) the minds of the people against them, have brought them almost into disuse. But I have no dout but that they will revive again when they think they can do any good. But before I proseed to describe the Society or meens of Knowledge I have mentioned I must make sundry Remarks on what hes bin & provibly may be done by the joint exertion of the few to inslave the Many, unless they meet with a check."

As a remedy for the evils of the time Manning suggests a "Society of Labourers to be formed as near after the ordir of Cincinnati as the largeness of the numbers will admit of—the Society to be composed of all the Republicans and Labourers in the United States who will be at the expense of obtaining the knowledge necessary to a freeman."

Manning's Conclusion

MANNING concludes his "Key of Libberty" with these words:

"I have often had it impressed on my mind that in some such way as this Society might be organized throughout the world as well as government, & by sotial corraspendence & mutual consestions all differences might be settled, so that wars might be banished from the earth. For it is from the pride and ambition of rulers & the ignoranc of the people that wars arise, & no nation as a nation ever got anything by making war on others, for whatever their conquests may have bin the plunder goes to a few individuals, & always increases the misiryes of more than it helps. . . . Thus my friends I have tryed to describe to you (not in the language & stile of the Larned for I am not able) But in as plane a manner as I am capable, the Causes that have always destroyed free governments, & the daingerous circumstances we are brought into by said Causes. Also I have described what I think would prove a Remidy, which is not a costly one, for if it should become general, confident I am that each penny laid out in it would soone save pounds . . . . And unless you see more dificulty in applying the Remidy or less need of it than I do, you will immediately put it on foot & never give over untill such a Society is established on such a strong & lasting foundation that the gates of hell can never prevail against it—which may the Almighty grant is the sincear desire of

A LABOURER."

Canada Again on Feet in Economic Come-back

None Faced More Serious Post-war Problems Than Dominion to the North

Above—Gypsum mining in Nova Scotia. In six months Canadian mineral products have had a value of $100,000,000. Left—Forestry will give the Canadians a profit of $600,000,000. Most of the vast forest area is publicly owned.

By EDWARD JEROME DIES

CANADA is again on her feet. This nation of the Northern Lights, boasting a population of eight million souls and sprawling from ocean to ocean over an area larger than the United States, has staged an economic come-back that will be glorified by the historians.

Of all the nations left blinded and quivering under the whirligig of new and ever-changing post-war conditions, none faced more bewildering home problems than did Canada. And it was with quick sure strokes that these problems were met. As a result the new Canada of today is marching into unprecedented national security.

Many years ago when the shiny steel rails of the first transcontinental line were biting their way across the open prairies, a world-famous author made a tour of Western Canada. On his return to the East he was asked his opinion of the vast new empire. For a thoughtful moment his brow darkened, then he replied:

"It is the land that God forgot."

To appreciate the folly of this learned man's remark and his colossal lack of vision, you have only to drop off the train anywhere west of Winnipeg. You will find a land of plenty, smiled upon by the gods.

Whirring reapers have been pouring into the world's bread basket what may be the biggest wheat crop in Canada's history. Authoritative estimates have placed the yield well over 470.000,000 bushels, and the oats yield at around 450,000,000 bushels.

The dairy industry, swelling through the adoption of diversified farming, is expected to touch new production peaks this year. In Saskatchewan and Alberta dairying is making such rapid strides that provincial leaders are laying the foundation for an export business of a hundred million pounds of butter yearly within the next few years.

Pastures are in good shape and live stock in excellent condition. Great numbers of high grade feeding cattle will be fattened this year on the nutritious alfalfa and barley so easily grown.

Conditions in the fruit belts, say government horticulturists, are extremely good. In British Columbia yields of all fruits are expected to exceed greatly the output of recent years. Several thousand cars of apples from the Okanagan Valley will be followed by abundant shipments of peaches, apricots, pears, plums and prunes.

Farmers are jubilant over the outlook. All Canada is jubilant. More people are employed in industry than at any time since the war. This is shown in the reports of the Dominion Bureau of Statistics. It is shown, too, that present conditions are not due to a temporary boom, but rather to a slow, steady resumption of normal activities, coupled with the bumper crop that promises completely to lift the farmer out of the mire of depression.

Canadian farmers have passed through all the unhappy conditions experienced by the American agrarians. But they will tell you with half a smile that they have used better judgment. They are not prone to give ear to the radical mouthings of the farm politician. Nor have they campaigned for special legislation in the hope of finding some panacea for all their ills. They have recognized fundamental conditions and have sought logical improvements, but not by centering their battle in the legislative halls.

In Canada they believe the American farmer has injured his own cause by swaying to the will of the ill-advised, self-seeking politician. The constant cry that the American farmer is in rags, a cry started two years ago by the politician and taken up by the farm press, is looked upon in Canada as having destroyed the American farmer's credit, broken his morale and distorted his vision of the future. It has injured his cause beyond measure, and likewise worked a hardship upon the entire country.

While radicalism has on occasion cropped up in the prairie provinces, its flare has been short-lived. Canadian farmers want facts and actions, not simply words and agitation. They believe in co-operation, but it must be sound and sensible. Theoretical schemes are offered in number, but are as quickly tossed into the discard.

This slower, safer method of the Canadian is a spirit that grips the incoming settlers, thousands of whom are taking up the low-priced lands in the rich prairie provinces. It is this same spirit, say government officials, that will steady Canadian agriculture and make its future position as secure as that of any country on the face of the earth. For this spirit of safety, this distaste of radical experiments, is nothing more than a spirit of permanent home-building.

To get the complete picture of the new prosperous Canada, one must consider the present status of other great industries besides that of agriculture. Take forestry, for instance. R. H. Campbell, dominion director of forestry, declares in a recent survey that there are approximately 500,000,000 acres of forest lands in Canada, half of which are covered with merchantable timber.

During the present year this industry has gone forward at great speed and will mark up a 1923 return to the Canadian people of more than $600,000,000. Virtually all of the forest area is publicly owned. A vast army of workers are engaged converting forest products into wealth. Forty million dollars will be paid to workers in the pulp and paper mills alone this year while nearly twice that sum will pass to workers in the lumbering industry.

Each year Canada's forests increase in value with the decrease in timber holdings of many other countries. Every province in the Dominion has its commercial forests, many of them as yet wholly unexploited. The forests of Quebec, Ontario and the Maritimes are the keystone of the giant pulp and paper industry. British Columbia, whose growing trade with the Orient has been the commercial sensation of the last two years, contains more than half of Canada's commercial timber and can produce as much timber in sixty years as the rest of the country can in a century. Even the prairie provinces have their commercial timber to the extent of 8,000,000 acres.

This year an unusually large volume of railroad ties, fir, pine and spruce planks and timbers has moved off to Europe and the Orient, with a stream of gold flowing back into Canada's national wealth. Revenue from forest products will be second only to agriculture. And this industry is just getting nicely under way. Along with the turn toward permanent prosperity in other industries comes a marked improvement in the mining situation. One of the big post-war problems was the tremendous surplus stocks. These have now been absorbed.

A report on mineral production for the first six months of the present year has just been made by the Dominion Bureau of Statistics. It shows a complete recovery from the distressing slump. A hundred million dollars in round figures is the value of mineral commodities produced the first half of the year. It represents an increase of more than forty per cent. In the metallic section the outstanding increases were in nickel and copper.

There has also been a marked increase in the output of gold in Ontario and British Columbia as compared with the years immediately following the war. This is likewise true of silver, while production of lead shows a forty per cent increase over the previous year.

As the great basic industries pushed forward, the smaller and dependent industries were spurred to greater activity. Right now there is in progress a building boom that stretches from coast to coast. The volume of construction, according to the government, far exceeds that of any period in the last nine years. If the present pace is maintained, contracts awarded for the year will have a volume of $250,000,000. All the large cities, including Montreal, Winnipeg, Toronto, Quebec and Vancouver, show big increases, while there is an unprecedented volume of home building in the prairie provinces due, it is said, to prosperous conditions in the agricultural centers.

What does the prosperity of the new Canada mean to the United States? Perhaps far more than the casual observer would reckon. Closer and closer the two countries are interlinked, not only in their positions toward world problems bearing on the future of this continent, but also in the advancement of their agricultural, commercial and industrial interests. This inevitable relationship will be cemented tighter and tighter as the commerce of the two nations expands.

To the average American citizen it will come as somewhat of a surprise to learn that before the bells toll in the new year America's financial investment in Canada will equal if not surpass the British investment.

Two billion dollars was the sum which Sir Lomer Gouin in the federal legislature estimated as America's investment a year ago. Since that time, according to an exhaustive survey just completed, $500,000.000 additional has gone over the border to Canada. At the last computation the British investment was estimated at $2,500,000,000. The growing American investment is expected easily to reach the British total in a few months.

"Then," said a financial leader, "Canada may expect a rivalry in which she must inevitably benefit."

United States money is entering into every phase of Canadian economic development. Of the total now invested, $1,200,000.000 is estimated to be in bonds and the remainder in farms, industrial enterprises, businesses large and small, mortgages, banking and private loans.

It becomes more and more difficult to compute the American investment because of the movement to establish branch plants of United States industries in Canada.

So everything considered, Canada has cause to be jubilant. Her big crops from cheap lands will offset low wheat prices. Her industries are humming. Her finances are strong and sound. Her trade balances are good. There is work for all. In the West, where there is room for a population of millions, many new residents from foreign lands, all carefully selected, are taking up farm lands.

Meantime the government, following a policy established several years ago, is doing everything possible to assist the farmer. This judicial assistance is not, however, of the kind that would appeal to the lazy farmer of a socialistic or communistic turn. The government helps the farmer who helps himself, and the Canadian farmer has proved that he can help himself

---

Developing Community Life in a Village

Concluded from page 9

alleys. The gymnasium rooms have been equipped with shower baths.

There are rooms for the entertainments and smoking rooms for the men. The floors are of highly polished oak. For furnishings no city in the state can offer greater comforts.

Fire proved to be a purging influence in the town. A spirit of community pride prevails. The older residences have been repainted. Schools and churches have been built. The young minister thought he would like the opportunities of a better education. The congregation promptly voted him a leave of five days a week to attend a college 150 miles away, on the understanding that he return for the Sunday service. He has become a church leader in that part of the state for his aggressiveness in striking boldly at community evils.

These are some of the activities that have been stirred by one man. Charles W. Fish is under fifty. He attains results because he works direct. He is as likely to be met in the lumbering camp wearing heavy woolen clothes talking to woodchoppers, as in the office of his company. By keeping close to the people he knows their hopes and aspirations. The building of little Elcho, with its fine dress and cleanliness, is largely the result.

There were rumors after the close of the war that the lumber business had been stranded. Once or twice it was whispered that the financial powers were planning a squeeze. But Mr. Fish was able to keep going. Now it is admitted that the menacing clouds have passed. Improvements and advance have routed slumber and stagnation in business and civic life.

There is a big lesson in the accomplishments at Elcho. It points the fact that small towns can be built up; that employment can be furnished and that there are as big problems to be solved in small communities as in large cities. Too little attention has been given to the village. It is the promise of the future. Unlike the city, its workers are not crowded into tenements. Factories are starting in small towns. Probably a decentralization of factory life is coming and the villages of the country will be built up with enough of the industries to keep the people busy and prosperous.

That probably is the real motive back of the unfolding plan of Mr. Fish. He told of one dream yet—to put 400 families on as many forty-acre lots and give them such a long time to pay for it that each family will attain a home of its own. Such are the realizations and dreams of the former sailor and iron worker, now a captain of industry.

Elcho has a community spirit that does not falter. It is all push. The little Nuremberg village in the wilderness is setting a hard pace of civic advance for other communities to follow.

OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

Harry Lauder is just Scotchman enough to refuse to give any shows on Sunday. On his second American tour he was contracted for Sunday work without his knowledge. He has never been caught that way since. For seventeen years he has had but one manager, a Jew, William Morris, who is said to be one of the squarest men in the business.

There are no beggars in Tokyo; the disaster which wiped out half the city produced not a single mendicant.

Sinclair Lewis' "Main Street" sold 60,000 copies in Germany, and when Lewis received his royalty check in London he cashed it for five shillings—or about one dollar American.

The first bill to pass at the present session of Congress gave a pension of $50,000 a year for life to Florence Kling Harding, widow of Warren G. Harding, late President of the United States.

Kish, capital of ancient Babylon, has been discovered by the Field-Museum-Oxford expedition. A stamped brick, bearing inscriptions praising King Sam-Su-Iluna, seventh king of the first dynasty of Babylon, has been disclosed.

The Spanish Government proposes to appropriate 100,000,000 pesetas for agricultural development, part of this money to be used for the purchase of machinery, fertilizers, seeds and other farming material.

"Cut the Taxes," is the demand of the Ohio farmers. And they emphasize the appeal by sending a covered wagon to the capital in charge of a woman Grange lecturer, clad in a costume worn by her great-grandmother in a similar conveyance.

Fifty airplanes will fly between New York and Chicago carrying passengers daily within ten years, according to the prediction of aeronautical engineers.

The average physician is notoriously an easy mark for the stock swindler. To offset this condition, an organization of physicians, surgeons and dentists has been formed which will investigate all investments offered to doctors. This organization will also sue the deadbeat who seeks to avoid paying for professional services.

The United States of America has received 35,000,000 aliens in the last century.

In Japan small fish are caught by trained cormorants, principally at night with the aid of jack lights. Rings are tied around the throats of the fishing birds to prevent their swallowing the catch. When their pouches are filled they are emptied in the boat well.

The United States dollar was adopted by all transatlantic steamship lines in Paris as the sole standard for determining passage rates.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Warm Chinook winds in Alaska have caused the melting ice water to erode new lands and expose deposits of gravel containing rich gold findings. On the west side of Turnagain Arm an avalanche 100 feet wide and a mile long rushed down a mountain, cutting deep into the soil, revealing three ledges rich in quartz. Every unattached man in Anchorage has left for the spot to stake his claim.

After July 1 the thickness of a standard board of lumber will be 25-32 of an inch with a proviso for 26-32 inch boards in special specifications.

To the end that war may be made as repellent to all classes as it is to those who must fight, the *Christian Science Monitor* has proposed an amendment to the Constitution of the United States, expressed in substance as follows: "In the event of a declaration of war, the property, equally with the persons, lives and liberties of all citizens, shall be subject to conscription for the defense of the nation, and it shall be the duty of the President to propose, and of Congress to enact, the legislation necessary to give effect to this amendment."

A British scientist experimenting with a stream-line filter along which liquids passed under pressure through thousands of tightly packed, perforated paper sheets, took the color out of red wine and tea and milk, leaving instead of the last named a tasteless fluid, like water.

"Regardless of the agencies that are working against him, the average boy of today will grow up to be a virile and polished man."—*Dr. Alfred E. Stearns,* headmaster of Phillips Andover Academy.

An American inventor predicts that in twenty years television will be in common use. Instead of seeing motion pictures some time afterward we shall be able to sit in a theater and actually see, as if on the spot, instead of many miles away, and at the same time hear.

Deer imported to New Zealand have become so large in numbers and so destructive to farmers' crops that it has been necessary to place a bounty of two shillings a head on them.

"Thoughts are the children of your brain and words are the garments they wear—do not make tramps of them. Words are all powerful—they can wreck homes, destroy lives, ruin business and devastate property."—*George Washington Robnett.*

By decomposing raw material and then allowing the products to be acted upon by hydrogen, an investigator has succeeded in producing petroleum products from vegetable oils thus obtained.

Captain MacMillan and his crew on the steamer *Bowdoin* frozen in the ice off the shores of Greenland, chat by wireless daily with neighbors living in the tropics. They have heard concerts from stations in England, Germany, Holland, Mexico, France, Italy, Norway, Japan, Spain and the United States. They have talked with Hawaii, more than 5,000 miles.

Three years more, under present conditions, and there will be no more salmon for the canneries. Ruthless competition and piratic methods of canners and fishermen have caused this condition.

An experimenter has induced hibernating plants to grow inside during the winter by giving them ether, either by the inhalation or hypodermic method. Roses so treated were immune to ordinary plant diseases.

The wig and robes of an ordinary English judge cost approximately $2,000. The lord chancellor, the attorney-general, the lord chief justice, the master of the rolls, and the lord justices of appeal are even more expensively dressed.

Mme. Curie, the discoverer of radium, is living in poverty in Paris. She has devoted every franc she possessed to scientific research. The French parliament has granted her a state pension of $2,200 a year.

There are at least 500 silver fox ranches in the United States, where the fur farmers have a total of from 12,000 to 15,000 of the animals in captivity. About $8,000,000 is invested in this industry.

A GOOD INVESTMENT FOR NINETEEN-TWENTY-FOUR

During 1923 nearly 600,000 men and women invested the sum of $1.50 in a subscription to THE DEARBORN INDEPENDENT—more than 65,000 sent in subscriptions during December alone.

These figures indicate in some measure the extent of the confidence placed in this publication and the manner in which it is carrying out the purposes for which it was intended. Invite your friends' and neighbors' attention to THE DEARBORN INDEPENDENT and the many articles of unusual interest which it prints.

Urge them to subscribe—they will never regret the investment.

Any Ford dealer will gladly accept subscriptions or they may be mailed direct, using the accompanying subscription blank.

CHRONICLER OF THE NEGLECTED TRUTH

The Senator From Texas

Legality of Method of Election Official Issue In Mayfield Case But Klan Is Real Issue

By MAX BENTLEY

EARLE B. MAYFIELD, Senator from Texas.

WHOM has Texas elected to the United States Senate to replace the venerable Senator Culberson? The Senate itself has reached the consideration of that question. The official issue in Earl B. Mayfield's case is the method of his election, whether it was legal or illegal; and that is the issue with which the Senate will deal, as judge of the qualifications of its members. The unofficial issue, which is the Ku Klux Klan and its alleged dominance in Texas politics, chiefly commands the attention of the country at large. The Texas Senatorial campaign of 1922 was a straight contest between Klan and anti-Klan.

Some months before Mr. Mayfield took the oath of office, a notice of contest was filed in the Senate in behalf of George E. B. Peddy, of Houston. With it was a long document containing sensational allegations against Mayfield and his election managers, and challenging his eligibility not only as the duly-elected Senator from Texas but as the Democratic nominee. To understand on what the contest is based, and some of the political maneuvers out of which it grew, the public should be given a non-partisan bird's-eye of the situation in Texas, as it existed at the beginning of the political campaign in the spring of 1922, during and after the Democratic primaries of July 22 and August 26, 1922, and before and at the general election of November 7. That bird's-eye is offered here by a Texan, who, as a newspaper executive, was in close and constant touch with the situation. It is given in sequential form.

Earle B. Mayfield was a member of the Texas Railroad Commission when the campaign for Senator was opened. He had never been a political leader. His candidacy was brought before the people prominently at a political rally in Dallas, January 20, 1922. Prior thereto he had not been considered a formidable aspirant, but the unexpected size of the rally, the great enthusiasm displayed, his introduction by the Cyclops of the Dallas Klan as "the next Senator from Texas," and the presence there of E. Y. Clarke, of Atlanta, imparted to the meeting an immediate and profound significance. Mr. Clarke was Imperial Giant of the national Klan, and acting Imperial Wizard; in fact, the responsible authority of and spokesman for the imperial body.

At that time it was being said in Texas that the Klan had resolved to cap its entry into politics by winning a Senatorial toga from Texas (its banner state in point of membership and power), but it was supposed that its candidate was Robert L. Henry, of Waco, for twenty years a member of Congress and once chairman of the Rules Committee of the House. Early in January Mr. Henry had returned from Atlanta with the candid announcement that he, as a Klansman, was in the race "by permission of the Imperial Wizard." Even earlier had come the announcement of Sterling P. Strong, of Dallas, calling for the support of Texas Klans on the ground that the Invisible Empire, being under a terrific bombardment at the hands of the press, needed a spokesman and champion in the halls of Congress. The Klan had many champions in Texas. There is no doubt that the so-called exposé launched against it by the New York *World* gave it caste and strength rather than accomplishing the object sought, which was to weaken it through ridicule.

The Dallas rally had its sequel in ratification meetings in klaverns of the Klan throughout Texas, until Mr. Mayfield, if he was not the unanimous choice of Klansmen, at least had behind him the already powerful and organized machinery of the order. Mr. Henry and Mr. Strong were completely sidetracked; and they retaliated by striking hands in the form of their resignation as Klansmen, and Strong's withdrawal and pronouncement that the interests of the people would be best served by Henry's election.

GEORGE E. B. PEDDY,

Who is contesting the election of Senator Mayfield, from Texas.

There were four other candidates. Senator Culberson was up for re-election, on his record. Cullen F. Thomas, of Dallas, entered as a Wilson Progressive and pitched his campaign mainly on the "dirt farmer" issue. James E. Ferguson, of Temple, former governor (impeached and removed from that office), was sounding his familiar war cry of reform, and drawing his old-time support. The sixth candidate was Clarence Ousley, of Fort Worth, a Conservative.

Texas at the time was in such turbulence of mind over the Klan that every other issue was waived aside. Pressure was brought on the candidates to declare themselves. Four declared anti-Klan, their replies shading down from the unequivocal to the strictly qualifying. Culberson's defiance of the Klan was particularly pointed, although brief; Ferguson likewise expressed himself with vigor. Henry was frankly a bitter-ender.

The line was very clearly drawn. It was Mayfield against the field. In the lesser races the Klan either had its own ticket or gave its endorsement, from governor down to constable, in nearly every precinct of Texas. At no stage in his campaign did Mr. Mayfield allude to the Klan (the Esch-Cummins law was his *bete noire*) but the known affiliation of speakers who introduced him at his meetings throughout the state made the source and center of his candidacy very plain—at least to the anti-Klan. His first admission that he had been inducted into citizenship in the Invisible Empire was made after the primaries, from the witness stand at Corsicana. That case will be discussed later.

The Democratic primary of July 22 brought victory to the Klan. Mayfield led the field with Ferguson second, and Culberson, Thomas, Ousley and Henry following in the order given. No candidate having received a majority of all the votes cast in the first primary, Mayfield and Ferguson went into a second, or run-off, primary of August 26. Along with them went the two high men in various lesser races; in each case Klan and anti-Klan.

Ferguson's unexpected strength was a facer for the anti-Klan wing. He was clearly unacceptable. Under the Constitution he was debarred from holding public office by reason of his impeachment. "Constitutional government" had been the rallying cry of the anti-Klan forces. How could they support Mr. Ferguson? Sorely puzzled, the state committee met and mulled the thing over. Mr. Mayfield himself suddenly cleared the air by saying, offhand, "Oh, let him run." Ferguson promptly pitched his campaign on the Klan issue.

For bitterness, the run-off campaign has had few parallels in Texas. When the smoke of battle cleared it was found that the Klan candidates had been defeated for the lesser offices, but that Mr. Mayfield had won again, and by a handsome majority. It was very evident that while the non-Klan element had supported Mr. Ferguson in numbers, the anti-Klan had balked. There was a vast deal of difference between the non-Klan and the anti-Klan.

The campaign now passed to the election stage. The Republican party in Texas went into action by officially outlawing the Klan by resolution of its state committee. Anti-Klan Democratic leaders responded by calling a non-partisan mass meeting at which, it was announced, an independent candidate would be named to oppose Mayfield in the November election.

The Republicans participated in this meeting, by invitation. The result was a coalition of Republicans and Democrats, for the first time in Texas political history. A candidate was named. He was George E. B. Peddy, a young lawyer of Houston—the same Peddy who is now the petitioner before the United States Senate.

Although a very young man, under thirty, Peddy had been active in politics for several years. As a student in the University of Texas he had led the opposition to Governor Ferguson, then at loggerheads with the institution. As a member of the lower house of the Texas legislature he had been floor leader in the impeachment of the governor. But in the Democratic run-off primary of 1922 he had not only espoused Ferguson's candidacy, but had managed his South Texas campaign; explaining that he considered Ferguson preferable to Mayfield.

A circumstance, auspicious or ridiculous according to the point of view, at once focused attention on Peddy's candidacy for the Senate. For his espousal of Ferguson he was invited to resign the presidency of a men's Bible class in his home city, Houston. At first he refused. Already disturbed, and even inflamed, Texas as a whole made an issue of this incident until, for a time, it threatened to overshadow the campaign itself. Peddy finally resigned. He did not only resign—he left that church altogether, announcing that thenceforth "I will worship my God away out under the trees in some quiet place uncontaminated with the poison of Ku Kluxism."

While Peddy was making his campaign, his managers suddenly launched an attack on Mayfield, in the courts. It was alleged by petition to the district court at Corsicana that Mayfield had violated a clause in the Texas election law limiting to $10,000 a Senatorial candidate's primary expense. It was alleged that not less than $40,000 had been spent by him, or for him with his knowledge and consent. The court was asked to pass upon the merits of the allegations and to debar the printing of Mayfield's name on the official election ballot. Injunction proceedings were brought against the Secretary of State.

The ensuing trial, before a jury, far overshadowed the campaign in public interest. It drew from Mr. Mayfield the first admission that he was, or had been, a member of the Klan. The testimony along that line (official transcript) was as follows:

Question by Mr. Nickels: Don't you know in your headquarters at Dallas you kept there a complete list of the members of that organization (Ku Klux Klan) of which the secretary was called by the name of Kligrapp?

Answer by Mr. Mayfield: No, sir, I don't know it.

Question: You have been in meetings of that organization, haven't you?

Answer: I think I have, yes.

Q: At Dallas?

A: Yes, sir.

Q: This meeting which you attended was a meeting of the Ku Klux Klan?

A: Yes, sir.

Q: You were a member?

A: Not at that time.

Q: You were before?

A: Yes, sir.

Q: And you are now, aren't you?

A: No, sir.

Q: About when did you cease to be a member?

A: Some time the latter part of January, before I announced as a candidate for the Senate.

The Corsicana jury found against Mayfield, partly on the court's instructions and partly by its own verdict. That is to say, it found that he had either spent more than the law allowed, or had knowledge of such expenditures made in his behalf. There was, however, no criminal phase in the case. The court then enjoined the Secretary of State from printing Mayfield's name on the election ballot.

The case was very promptly appealed. The higher court brought further complication into a muddled situation by reversing the Corsicana court on the ground that the petitioners, in bringing their action, had erred in not having some county official in the county of trial join them as co-petitioner. The higher court therefore deemed it unnecessary to pass upon the merits of the testimony. The case was carried from court to court, injunctions and counter-injunctions were issued, until, finally, only two days before the day of election, the

The Days of Hoopskirts and "Hitting the Ball"

Consider the Lives of Mrs. Gray of Yesterday and of Mrs. Ultra of Today

By G. W. BARRINGTON

SHE came to seduce me into donating to a fund for the uplift of certain joyously wicked, comfortably filthy, constitutionally inert and complacently self-satisfied heathen in Siam or Korea or somewhere—it matters not, for she didn't get a farthing.

Her cheek had borrowed the delicate pink tint which lingers on Matterhorn after the day has sped.

Pearly teeth gleamed in the Cupid's bow of her full-ripe lips like pristine dewdrops set in the corona of a crimson rose.

Her henna hair, her drooping raven lashes and delicately penciled brows framed in fragile, subtle tracery the shell-pink ears and swansdown throat.

And it was high-class workmanship all the way around.

As to dress, she was *knee* plus ultra. That says enough, for a description of her apparel from the waist up would need be very brief indeed, while from the waist down one could only look and look, and, looking, say with the Bard:

> Man wants but little here *below*,
> Nor wants that little *long*.

Mrs. Ultra belonged to clubs, guilds, leagues, bands, federations, circles and missions and was three societies, two associations and a board ahead of her strongest local competitress.

Her mission was to convince me that there are heathen on earth sadly in need of moral enlightenment, and she succeeded admirably.

Breezily cocksure was Mrs. Ultra as she sagged six inches or so on one hip, with a corresponding elevation of its fellow, and definitely settled knotty problems of foreign policy which have bothered the minds of our brainiest statesmen, from Washington to Brookhart—which is quite some distance, any way you view it.

Shifting vertebrae, she disposed of pestiferous internal affairs in the same easy, off-hip fashion. If there was any difference, I think her domestic hip ascended to greater heights than the one that hunched affairs of international interest, but it may not have remained up so long.

Foreign relations are so complicated.

Just in the nick of time I restrained a natural impulse to ask the lady to be seated. She might have tackled prohibition and the rapid shifting to and fro between the international and intranational aspects of the thing probably would have resulted in the complete destruction of my visitor's chair—a spindly antique.

Having got me fairly hypnotized, my preceptress presented an amazingly detailed mass of statistics showing exactly how many care-free heathen were going down to torment, singing and unafraid, during every precious minute that we dawdled in idle converse.

Five times during my period of torment she referred contemptuously to customs and conventions of bygone days as "hoopskirty," and each time she did it, I took another reef in my purse-strings and condemned another batch of unconcerned heathen to slide grinning to their sizzling doom, without a fair trial.

* * *

Some pretty good little old women wore hoopskirts.

* * *

Some subtle alchemy flared the hems of the beruffled skirts worn by the grandmothers of the silver-gray boys of today, but no mere male ever knew precisely how it was done, for in that day unmentionables were unmentionable and unmentioned.

Conceding that the hoopskirt was the basic structure of their attire, as well as the most intimate portion of it that may be discussed with propriety, we will proceed to build a vision of grandmother.

Swathing the hoops was a flowing skirt with tucks and ruffles and pleats and darts forming a fleecy setting for the quaint basque with trailing polonaise.

Remember the spotless ruching at wrist and throat, the lace mitts, the hand-painted fan, the cameo brooch and the ever-present parasol?

Remember the stately carriage, the carefully modulated speech, the cool, friendly smile, the quiet dignity, the serene self-restraint and the God-given intuition which prompted the right word and the right act at precisely the proper time?

As a maiden, Silver Gray's grandmother played the spinet, embroidered wall mottoes, made wax flowers and danced the lancers and the minuet with no inspector present, and none needed, for mother was on the job.

As a matron she cooked, sewed, churned, spun, wove, knitted, darned, patched and "kept house," and still found time to rock cradles and guide worlds with a steady hand.

As a grand-dame she was guide and friend to father and mother, the arbiter of childish quarrels, the supreme court of appeal when parental authority imposed tyranny, the mother confessor who granted absolution or imposed penance, the wise physician who bandaged sore toes and purged turbulent tummies.

Dame, matron and damsel met in sober conclave to censor their own plays, select their own music and literature, choose their own friends and model their own lives.

And when, pray, did that trio ever make a mistake?

Come to think of it, those hoopskirted women were exacting, at times even despotic.

They knew what they owed to society and paid graciously; they knew what was due them and collected to the last iota.

* * *

When Silver Gray reached his teens, symptoms appeared.

One morning he discovered a growth on his upper lip and retired to the hayloft to scrape it off with a Barlow knife and laundry soap.

His voice alternately roared in basso and trilled in treble, running a succession of chromatic scales with slurs, retards and acceleratos, to his extreme mortification in public but to his boundless delight when he rehearsed in the cow pasture and knew that the bass notes grew ever more predominating.

Silver shyly donned long trousers and defied the scorn of the gang by trimming his nails regularly, adopting "stand-up" collars and refusing to go in swimming with his clothes on.

He suspected that he was a man, though he denied it sheepishly enough, but one day something occurred which forever dispelled doubt and brought the lad to the proud realization of his new estate.

* * *

Silver Gray is eighteen, and has been accorded the long-coveted privilege of handing grandmother into the carriage.

Coached for weeks previously by solicitous elders, shaved publicly by a real barber, frankly pomaded and openly powdered, he dresses as for the Queen's court and presents himself at the curb precisely on the minute.

The front door is opened noiselessly and closed without sound; the veranda fills with fluttering draperies, and queenly grandmother comes floating down the pathway like a stately frigate under full sail in a gentle, steady breeze.

Remember now, youngster, no unseemly haste, neither indolent slouching! Brace your shoulders! Hold your head up! You are esquire to a thoroughbred; look the part!

The youth opens the carriage door; his right glove crosses left palm; the walking stick follows it, then the hat, as Silver bows low, outwardly composed, inwardly a-tremble.

The right hand crosses his swelling chest again as he straightens, and on the instant the tips of Grandmother's cool, firm fingers meet it with a touch as light as the flutter of a butterfly's wing.

The parasol folds, seemingly of its own volition, its ferrule pointing at the exact spot on the carriage floor where it is destined to rest.

Some subtle, intangible force works among the ruffles; the skirt billows up ever so slightly; two white slippertoes steal in and out like twin weasels anxious to see and be unseen.

The stately head bows acknowledgment, the weasels cross the step, and the honored dame is safely inside, smiling back the verdict which makes Mr. S. Gray, Esq., fit to walk among his fellows.

* * *

Last night when young Barnes came to take that Bishop girl over the way out for a spin he honked his way up to the curb, cap over one eye balanced by a bulldog pipe in the opposite corner of his mouth, removing neither when he yelped: "Hop in, Peg! We gotta hit the ball, or the bunch will be gone bluey before we get hep to the jazz!"

Peg hopped!

We silver grays are lonesome for something which was but is not, and it is our firm conviction that when Grandma started on her sedate outing in the lumbering old chaise she took something with her that did not hop into the high-powered roadster with Peg Bishop.

We console ourselves with the thought that human nature is as unchanging as any other eternal fixture, and that, after all, a woman is a woman, hoopskirted or knickerbockered.

Rich with the philosophy of years, we know that inasmuch as the pendulum has swung to the uttermost limit of modernity, return momentum will carry it as far.

The blare and whang and jangle of jazz hogs the program, but Mozart and Liszt and Wagner will live through their works, and even "Annie Laurie" and "Silver Threads Among the Gold" will soothe men long after we have forgotten "Yes, We Have No More Bernanners" and "Tie Your Little Bull Outside."

Cubists, futurists, vorticists in turn have filled and emptied and refilled the galleries but the "Angelus" was painted in durable oils, and the "Milo" will stand in chaste marbled perfection long after the last tawdry present-day monstrosity has been thrown at the cat.

"Her Secret Sin" and "The Unmarried Husband" neck and neck it for the position of best seller, but the masters still are on the shelf, dog-eared from much usage.

Atheists, scoffers, skeptics raise their raucous yammer, and Bible-lamming creedsters confuse with their bigotry, but there stands the Cross, and the Star of Bethlehem will twinkle its cheery message at Christmastide right on through the years to the millennium.

Dress, mannerisms, conventions, art, music, literature, tenets which have no appeal other than novelty, may attract, but cannot hold, for of course nothing can remain novel.

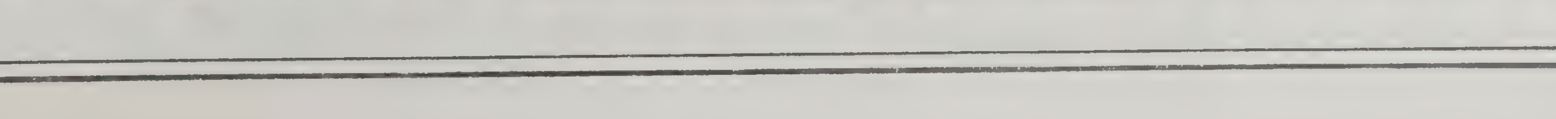
So let none scoff at those quiet gray women in hoopskirts. Heedless frivolity distracts us from their teachings. Mistaking mere innovation for progress, thoughtless modernity turns from their standards, unmindful that right-angular deviation from tried paths is not progress, but sidestepping.

It is well that hoopskirts never will return; we should have to breed a generation of women to harmonize with them.

But hoopskirtism can and will return, because it is good, and everything good that ever was will be again.

Men of the future will look back upon Grandmother Gray and upon Mrs. Ultra.

Which?



Life Insurance Rate Juggling Costs Millions

Policy Buyer, Bewildered by Needless Complications in Forms, Often Signs Blindly on the Dotted Line

LIFE insurance is the biggest business in the country. In January, 1923, the total amount of such insurance in force was more than fifty billions of dollars.

During 1922 the total income of 260 life companies, as given by the official Insurance Year Book, was $2,137 294,355, and we saw that during the same period the total payments of these companies to policyholders amounted to only $1,006,931,734, leaving a difference of more than one billion dollars ($1,130,362,621), between income and payments during 1922.

We shall endeavor to show, through an examination of the rates charged by the commercial companies, some ways in which this enormous excess was accumulated.

As made plain in the first article, the business of life insurance is a matter of public concern, and, as Dr. Huebner, of the University of Pennsylvania, maintains, "is a fit subject for some sort of government regulation designed to protect the public adequately against mismanagement and unjust practices." This is true by reason of the fact that it is the public who contributes the funds out of which insurance is paid, the company being a mere trustee or agent of those funds.

We saw, in the findings of the Armstrong Investigating Committee in New York a few years ago, how wantonly the big insurance companies in the past have abused their sacred trust, squandering the funds that belonged to widows and orphans on enormous commissions, $100,000 to $150,000 a year salaries to their officials, "yellow dog funds" for corrupting state legislatures, and munificent contributions to the campaign funds of a political party.

But the question now before us is, as before stated, how was that billion dollars excess of collections in 1922 accumulated?

Little Risk for Companies

PERHAPS after a little inspection of the insurance business from the inside, as it were, we shall see some of the ways in which the public is being forced to pay enormously more for insurance than is warranted by the current cost, and in many cases maneuvered out of just rights after a policy has been taken out.

While the word *risk* is often used as synonymous with insurance, as in the phrases "risk companies," and "risk business," *as a matter of fact there are few businesses in which the element of risk really enters so little as in the life insurance business today.*

The reason for this lies in the development of the science of statistics. It has been found that there is really no such thing as chance, statistically speaking, when computing the probability of death among a given number of people, in the different age groups, at any given time. The number of persons in a particular group who will die during a year can be determined with uncanny accuracy.

So true is this, that practically all insurance companies are now basing their rates upon the so-called American Experience Table of Mortality. The American Table was compiled by Mr. Sheppard Homans, in 1868, while actuary for the Mutual Life Company of New York, and it is recognized throughout the various states as being fully accurate and dependable.

Therefore, all that it is necessary for a company using this table to do is to collect premiums sufficient to provide for the number of deaths at the different ages as shown by this table, and a reasonable overhead for expenses.

Sounds simple, doesn't it? It is.

And so the unsophisticated layman would probably imagine that the insurance companies have a uniform rate at which all life insurance is sold to the public, graded according to the age of the applicant.

As a matter of fact, there are innumerable different prices for life insurance, and hundreds of different ways in which they may be paid. In other words, each company is largely a law unto itself. Each company has its own assortment of policies and rates, from which the bewildered applicant for insurance is invited to take his pick, the chances being that after he has signed on the dotted line he does not really know what he has bought or whether he has paid a just and reasonable price for it.

It would seem almost as if life insurance is purposely made so complicated that the average buyer shall be unable to grasp the real significance of the jumbled policies that are offered for his acceptance.

When a man finds himself in need of an article of merchandise, he goes to a reliable store and, after looking over the articles offered and making a choice, he knows what he has got. In the insurance business it would seem to be quite the reverse.

If you are poor and not robust in health, and have moreover a dependent family, you are the very person who has most need of life insurance. If the insurance business were the benevolent enterprise it is so often represented to be in its advertisements, you would be given the strongest encouragement and the freest opportunity to take out insurance. The cold-blooded fact is, however, that the insurance solicitor will shun you as if you had the cholera.

But if you are known to be prosperous and have money for investment, and if the insurance company is convinced in its own mind that you are a "good risk," that is, that there is no probability of your dying for many years, it will move heaven and earth to get its hands on your money by appealing to your love for your family, and will sign you up for as fancy an assortment of policies and in as big amounts as the latest arts of "salesmanship" can induce you to buy.

By J. V. NASH

This is the second of two articles by Mr. Nash. The other appeared in the last issue of The Dearborn Independent.

In fact, nowhere is "salesmanship" more efficient than in the life insurance business. *If you are a "good risk" you are no risk, and hence a desirable customer.* The insurance agent is constantly on the lookout for such prospects, and once he has the scent of your trail, you will be placed under regular siege at your home and place of business and will not know a moment's peace until you have hoisted the white flag. Then the agent, like a conjurer, will juggle policies and prices before your eyes, reeling off his parrot-like "sales talk" all the while, until your head begins to swim and you gradually lose consciousness. When you come to, the agent has left and you find a copy of a policy—perhaps two or three—lying before you, with your name signed on the dotted line.

Why, you may ask, does the public stand for such a state of affairs? Simply because the average insurance buyer regards life insurance as a very mysterious business, through which he is going to get something for nothing—perhaps—and which he could not understand if he tried; and the insurance companies encourage that state of mind. *In the hypnotism of the public lie the profits of the companies.*

The needless complication of insurance writing is one of the chief factors entering into the enormous expense of conducting the business. The accounting system of an insurance company is such an intricate maze that an army of actuaries, statisticians, expert accountants, ditors, and other high-salaried officials must be constantly employed to keep it from degenerating into hopeless chaos—all at the expense of the policyholders.

Arthur Brisbane, commenting on the fact that life insurance in the United States increased three hundred millions of dollars during the first six months of 1923, remarked: "The wise man insures his life, but modern insurance with its costly solicitors, will one day be replaced by simplified insurance."

As the basis of all insurance policies is a payment called the premium, we shall start our discussion of insurance rates by a little non-technical explanation of this mysterious word. "Premium," according to the dictionary, means "reward" or "recompense." It is simply the annual charge upon the policyholder for the cost of carrying the insurance.

By "natural premium" is meant the actual current yearly cost of insurance. The mortality tables will tell us infallibly the number of deaths which will occur in a specified group, for each year of age. Beginning with the age of ten, we find the number dying decreases gradually until the age of twenty-five is reached. The number then remains stationary to and including age twenty-eight; at twenty-nine it begins to climb in a slow but steady ascent, year by year, reaching the peak at seventy-three and then more rapidly falling until the vanishing point is reached in age ninety-five. At ninety-six you are, for insurance purposes, dead.

What Rate Making Really Is

TO ILLUSTRATE the process of rate making: At age thirty-five the American Mortality Table shows that 8.95 persons will die out of each 1,000. Suppose, then, that we wish to insure 1,000 persons of that age for $1,000 each. All that we have to do is to collect $8.95 from each individual. This will give us a fund of $8,950, which will be just the sum required to pay $1,000 each on 8.95 theoretical death claims.

Similarly, at age forty-five there will be 11.16 deaths in a thousand, and at age fifty, 13.78 deaths, the natural premiums being $11.16 and $13.78 respectively.

Beautifully simple, isn't it? Nothing, indeed, is simpler than to compute the exact cost of life insurance, and yet there is nothing more complicated than a life insurance policy—the bill of sale on a package of life insurance. The computation of the cost of life insurance is, for instance, far simpler than the computation of the cost of an automobile, a suit of clothes, or a pair of shoes, yet on none of these would you expect to be offered a choice of a dozen different prices for identically the same article.

What would you think of a shoe-store which displayed a pair of shoes in its window, with a price-card attached reading somewhat as follows:

A BEAUTIFUL ASSORTMENT OF PRICES FOR
THIS PAIR OF SHOES, ACCORDING
TO THE STYLE OF INVOICE
SELECTED—
$4.50 —Plan of Payment No. 1.
4.87½—Plan of Payment No. 2.
4.98 —Especially for ladies.
5.00 —With 25 cents rebate.
5.25 —With a chance on a pair of rubbers to match, and if you win we take back the shoes.

Or, what would you say if, on asking your tailor how much he would charge for making you a suit of clothes, he replied nonchalantly: "Oh, I have a dozen different prices for exactly the same suit. Let me show you some of our beautifully engraved bills of sale, and explain about the different prices at which you can buy this suit of clothes. I am sure you will find a price to your liking."

Yet that is something like the proposition the insurance companies will put up to you when you express a desire, or yield to the solicitor's urging, to buy $1,000 worth of life insurance.

We have seen what is meant by the natural premium, and we have seen that, according to the American Table, it will be exactly the same everywhere for each age group. But does the actual premium as charged by the companies bear a uniform relation to the natural premium? Far from it.

Here are the premium rates for $1,000 at age thirty-five in some of the well-known companies. It should be borne in mind that in each instance the insurance buyer is purchasing exactly the same commodity—$1,000 insurance protection.

Kind of Policy	Annual Premium	Insurance Bought
Ten Year Term	$ 14.50	$1,000
Twenty Year Term	16.24	1,000
Ordinary Life	28.11	1,000
Twenty Payment Life	38.34	1,000
Fifteen Payment Life	45.91	1,000
Twenty Year Endowment	51.91	1,000
Fifteen Year Endowment	69.52	1,000
Ten Year Endowment	105.87	1,000

It will be perfectly clear from the foregoing that, if the company can carry the insurance for ten years at a flat rate of $14.50, any policyholder in the whole list who dies before the end of the tenth year and pays more than $14.50 a year for the $1,000 insurance, has in effect made a large donation to the company over and above the legitimate charge for carrying the insurance. Even on the $14.50 rate, the payments during the first few years will be larger than the current cost of the insurance.

Overpayments Pile Up Rapidly

IN THE same way, any one of the policyholders dying between the tenth and twentieth years and paying more than $16.24 a year has made a large donation to the company. In other words, he has paid more for his insurance than would be sufficient to cover the natural premium plus expenses and a reasonable profit to the insurance company.

Just how much the insurance companies are unfairly profiting from this condition is indicated by the following figures taken from the report of a great New York company.

"In July, August and September, 1922, the company paid 2,398 claims of deceased policyholders, as follows:

108 died in first year of insurance.
125 " " second " " "
403 " between third and fifth years.
397 " " fifth and tenth "
809 " " tenth and twentieth years.
556 " after twenty years.

2398 Total."

It is perfectly evident, therefore, that 1,842, or the great majority of the 2,398, died before twenty years, thus forfeiting all overpayments above current cost of the insurance. In other words, the policyholders are charged more than was right or proper to pay these claims, and the insurance company pockets the difference.

How these overpayments are accumulated is explained by the fact that when an insurance policy is written for a term of years or for life, a flat premium payable each year is offered. For instance, in the case of an ordinary life policy, taken out at the age of thirty, the company coolly assumes that you are going to reach the age of ninety-six. Instead, however, of asking you to pay premiums at an increasing rate each year, it lumps the premiums all together and levels them down to an average, payable without change each year. The justification it gives for this is, that it relieves the buyer of paying higher premiums in his old age. But if he dies before reaching old age? Therein lies the joker.

It thus happens that when a policy is taken out, the insured begins, through his premium payments, building up a fund called the Reserve, which gets larger the longer he lives. During the earlier years, the insured pays much more than the current cost of the insurance. This overpayment is the source of the reserve and the basis of the loan and surrender values which the companies have been forced by law to allow on policies.

But in case of the insured's death at a premature age, this excess payment is deducted from the amount due the beneficiary. In other words, it is for all practical purposes an assessment. As a prominent insurance man puts it: "The legal reserve companies cannot assess you while living, but under the law they can and do assess their policyholder's beneficiary the total amount of overpayment, called reserve, to pay the claim."

This being true, it would appear that the only difference between mutual assessment or fraternal companies and the so-called old-line legal reserve companies is that in the one case the assessment, in case premium payments are not sufficient to pay losses, is made before death, and in the other after, and in the latter case the assessment is not a matter of necessity. "All legal reserve policies except term policies," the insurance man already quoted points out, "are essentially assessment policies."

It will be noted in the table we have given that at

Don't Interfere With Bedouins and They Won't Bother You

Desert Folk Glad to Remain at Peace If No Attempt to Change Them Is Made

By BURT P. GARNETT

This is the second of two articles by Mr. Garnett.

(C) Underwood & Underwood

Bedouin women churning milk—typical interior of a big tent, Syria.

THE treatment of Ishmael, legendary sire of the Bedouins, and his mother at the hands of Abraham, might well be calculated to make him bitter against his father and not too friendly toward his half-brother, Isaac, although he was present at Abraham's burial.

The Bible dismisses him, in Genesis, with the statement that he died at the age of 137 years, and that he left twelve sons, whose names are much like the names found today among the Bedouins—Nebajoth, Kedar, Adbeel, Mibsam, Mishma, Dumah, Massa, Hadar, Tema, Jetur, Naphish and Kademah.

If, indeed, the Bedouins were descendents of Ishmael, the indications are that these cousins of the Israelites were divided from them in religion, tradition and culture. The Arabs took readily to the idea of one God, whose prophet, of course, was Mohammed, and this indicates a racial tendency to think like the Jews but not to think as the Jews thought.

The Bedouins are proud of their Semitic origin but are not particularly proud of their kinship with the Jews. If they are indeed the sons of Ishmael, the Egyptian strain in them would seem to be much stronger than the Hebrew.

Their manners and customs suggest Egypt rather than Judea. However, their forty or fifty centuries perhaps entitles them to call their characteristics Bedouin and nothing else.

There is something characteristically Bedouin in the next mention of an "Ishmael," in the Bible. This is in the Book of Jeremiah, and concerns a particularly soulless raid of plunder and murder. Ishmael, described as the son of Nethaniah and "of the seed royal," went with a few men into Mizpah under the guise of a friendly visit, and treacherously carried away with him loot and captives. It is, perhaps, not fair to say that the treachery of this Ishmael is typical of Bedouins. Usually they do not bother to be treacherous. There is, even their enemies admit, something rather gay and care-free, if boisterous and rough, about the way they conduct their holdups. They seem to rejoice in robbing a rich caravan in the same manner that a clever trader waxes happy over a fat day in the stock market.

However, one traveler in their lands brings forth one story about the Bedouins and another an entirely different one. Perhaps much of the lore concerning them is invented by the guides who take charge of tourists. And if those guides are no more accurate and reliable than those who pilot visitors through the Capitol at Washington, the tourist may not have the absolute truth.

More likely, the stories about the Bedouins probably are nearly all true—to a certain extent. The Bedouin exhibits one sort of conduct one day and another sort another day. He is a changeable fellow. Why shouldn't he be? The rules by which he lives are very general in nature, elastic and capable of various interpretation. Impulse is as good a motive as another.

Usually an invading army subdues the natives it finds. It was so when Attila and his Huns swept down upon the Greeks. It was so when Caesar and his Romans took England. The Spanish, English, Dutch, French and Portuguese who came to the Americas subdued the Indians and either killed them off or made them conform to the rules of civilization.

Such is not the case in Arabia. Instead of making the Bedouins behave, the British and French, who have mandates over this ancient land, pay them to behave, and pay them well. They do not attempt to deceive themselves about the Bedouins. The Frenchman and the Englishman well know that the Bedouin is more than a match for him in wits and in fighting strength—despite the invader's machine guns, his airplanes and other modern fighting machinery.

If the lands that the Bedouin calls his own were richer lands, there might be a different story to tell. If there were mineral deposits or oil to be found in the desert, or if there were agricultural possibilities, an expenditure of men and money to conquer these wild, free men, might be justified. As it is, peace and noninterference with them seem much more desirable.

Such parts of Arabia, of Syria and of Mesopotamia as offer opportunity for commercial exploitation are being exploited, naturally. This sort of thing, however, is not new to the Bedouin. The Young Turks had ambitious plans and went far toward completing them. They may have gone too far, these Turks, since the powers among the various tribes in Arabia quickly acted when they saw an opportunity to get out from under Turkish rule.

The Bedouins are interested in what the foreigner does in Arabia only in a moral sense, as long as no effort is made to interfere with their life and habits. If the foreigner wants to cluster around the city of Mosul and become highly excited over oil wells, build a large number of queer-looking derricks and keep crowds of men scurrying about like a lot of excited ants over a stream of smelly black fluid that comes out of the ground, well and good. The Bedouin looks on with interest and perhaps with suspicion for a time. He is ready to check any move that seems directed at his desert and grazing lands. When no such move is apparent and the foreigner continues to be a pleasant fellow, otherwise, the Bedouin goes about his business.

The British are exceedingly wise at colonization and at getting on with native populations the world over. They are friendly, arouse no feeling on the part of the native that he is being ruled, do not attempt to change his religious beliefs nor alter his customs—as long as those customs do not interfere with the purposes for which the Englishman goes into the land. So, it is probable that under the British mandate Arabia will make progress.

The danger lies in the Wahabis. These are brothers of the Bedouins in whom the religious strain has become fanatical. They are said to consider death a welcome thing, in that it opens the door to paradise. Their home is in the desert land of Nejd, the capital of which is Raid, which few men not of the Mohammedan faith have seen.

They might be called "fierce Puritans." They follow the "true teachings" of Mohammed, and are strict prohibitionists, forbid the use of tobacco, look with stern disapproval upon decorations in the mosques or upon the graves of the dead. They wear no jewels. Yet, despite their strict code of living, they believe that every Mohammedan has the right to live according to his own, individual interpretation of the Koran.

(C) Underwood & Underwood

An Arab home in Babylonia.

The chief of the Wahabis is Abd el-Aziz es-Saud, a young man, about thirty-five years old. He is a very clever young man, which is shown by the fact that he receives from the British Government a salary of $25,000 a month, and a New Year's gift of $100,000. This money serves to prevent Wahabi raids upon the camps of unbelievers and otherwise to keep things peaceful. Many other Arab chiefs likewise are paid to refrain from conducting raids, both the British and French contributing.

The Wahabis, while placing an irksome restraint with their rigid ideas of religion upon the Bedouins, have the respect and sympathy, to some degree, of the Bedouins. Let a crisis arise, with the Wahabis at war with some horde of unbelievers, and a great many Bedouins may suddenly and mysteriously appear among their ranks.

The Wahabis possibly offer a protection against the wiles of civilization. The Bedouin rather fancies the phonograph, and sits at night in his desert camp, smoking, sipping coffee and listening to "Yes, We Have No Bananas," as sung by some famous American vaudeville artist. He grins and pats his sandaled foot upon the sand in time to the tune. Now the Wahabis look upon the phonograph as one of the most accursed of infidel inventions—a feeling that perhaps is shared by some apartment-house-dwelling Christians.

These days the Bedouins are taking a good deal of interest in Jerusalem. It presents an interesting mixture of Mohammedans, Christians, Jews and a goodly sprinkling of Buddhists and representatives of other Oriental religions. Travelers come there in great crowds and it is a good place to trade—or perhaps to do a little stealing. Taking property from an infidel is not such a bad thing to do.

The Bedouin with his brother Arabs believes that Jerusalem—all of Palestine, in fact—is a good place to watch just now. The Arab feels that the newcomers to Palestine are taking the attitude that the country is theirs. The Zionists, for instance, come in with money and bustle about in a very sure-of-themselves manner, as if making preparations to run the country. Since more than seventy-five per cent of the inhabitants of Palestine are Mohammedan, they look darkly upon any indication that there may be a rule of a minority in Palestine.

Sir Herbert Samuel is the High Commissioner representing British interests. He was appointed because he was a Jew and also because of the Zionist movement. The Arabs are inclined to view with extreme doubt the statement from the Commission that the Zionist movement means only that the Jews are to have a national home in Palestine. They suspect that underneath this is a plan to turn the government over entirely to the Jews. And they are holding themselves ready to make plenty of trouble in case of such a move.

The Bedouin, scenting trouble, is hovering near. If there is going to be trouble—interesting trouble, where gallant fighting may take place—he wants to be in on it.

The Mohammedans have little to fear from Jews who have gone there from America, says W. H. Porterfield, an American who has just returned from Palestine.

"I met a number of them on the boat, going to Palestine with high enthusiasm for the Zionist movement," said Mr. Porterfield. "Going back, they were less enthusiastic. In leaving America, they had a poetic vision of their ancient home, with great zest for the idea of restoring the country and setting it apart as the national home of all Jewish people. When they actually saw the bleak, backward, unbeautiful, terrifically hot place that Palestine now is, with an expenditure of years and millions of money necessary before the land could be made to be agreeable to them, with their cultivated Western tastes, they were vastly disappointed."

It has been suggested that if some experienced American hotel operator were to erect a couple of good, modern hostelries in Jerusalem, these might contribute somewhat toward the success of the Zionist movement.

Mr. Porterfield says that he found, not so much an ambition on the part of Jews from America to remain in Jerusalem, *as an ambition of the younger Jews in Jerusalem to come to America.*

Junius B. Wood, in the *National Geographic,* tells of a motor trip made last spring through the desert; of horses and camels snorting and running away in fright. One camel, the leader of a caravan, broke away and made off across the sands in tremendous haste, followed by the others of the train. The motor car turned and gave chase, with the camel drivers hanging on the running board, their robes flying in the wind. An exciting pursuit over dry creek beds, dunes and sand finally resulted in the capture of the lead camel, whereat the others quieted down and the caravan was reassembled and proceeded on its way. However, the automobile is a subtle thing. If the Bedouin becomes charmed by it, as well he may, he is lost! A few years and he may be a good-roads booster. The government may then say to him, "No taxes, no roads," and he will give in.

By the nature of things, the progress of industrial development in such a country must be slow. Until it comes—if it ever does come in such a way as to disturb the life and habits of the people—the Bedouin will continue to be the same person he always has been.

He has not changed his style of dress in many centuries. He wears a galabeah, or semi-fitting gown, made of striped or otherwise colored material, a white, flowing robe called the "abayah," silken headgear of "kaffeyah," which is fastened to his head by thick cords of colored silk or wool, which are called "agals."

The Bedouin is as he is—and as he was thousands of years ago. He confidently expects so to remain. Call him "outcast," if you will. Ishmael was an outcast. His descendents find no disgrace in the term.

Boys Who Played at Journalism

A Closed Chapter in the Boyhood of America

By JOSEPH DANA MILLER

THAT boys ranging in ages from fourteen to twenty once published papers, held national and state conventions, and went through all the mimic motions in campaigning for their favorite candidates for official honors in these various associations; that the papers spoken of varied in size from two pages three by four to twenty-four pages six by nine or larger —that as many as three thousand were issued in a single year in the heydey of the period, 1878-82—all this reads like a fairy tale. Yet the history forms one of the most interesting chapters in the boyhood of America.

Amateur journalism, as it was termed, had a somewhat remote beginning. The boy journalists of the seventies were wont to trace its origin to Thomas Condie who at the age of fourteen, in the early period of the last century, published the *Juvenile Portfolio* in Philadelphia. It was issued weekly and was continued for several years at 22 Carter's Alley, opposite Stephen Girard's Bank.

The *Portfolio* was creditable for a boy of fourteen. Its language is stilted but correct. A little amusing is its Salutatory in the number for October 17, 1812, from which we quote:

"The Ladies will receive the *Juvenile Portfolio* as an interesting companion, studious of their favor, by courtly manners and valuable information; and the Gentlemen will find in it a manly and correct conduct, which we hope will be not unworthy of their regard; and as we shall ever be anxious to please the Polite, the Learned, the Witty and the Fair, with these views we are emboldened to ask the patronage of the public."

It was not, however, until 1865 that any great number of papers were published by boys in this country. The introduction of cheap hand presses, Kelsey's "Excelsior," Wood's "Novelty," Curtis and Mitchell's "Caxton," and others gave a great impetus to the movement, increasing the number of boys who printed their own papers. An Amateur Press Association was organized in 1869 embodying the eastern and New England states. In 1875 a directory was printed containing the names of more than five hundred boy editors and authors, representing as many papers.

But in 1876 a real beginning was made with the organization of the National Amateur Press Association in Philadelphia, the home of Thomas Condie, and from that day to the late eighties the boys who edited and published or wrote for these little papers steadily increased. Every year since that time up to the late nineties these boys gathered at some city west or east for the election of a board of officers of the national association and the administration of the affairs of amateur journalism for the ensuing year.

These conventions were preceded by the hottest kind of campaigning, wire-pulling and fiery criticism of the opposition. They were usually attended by a hundred or more delegates, and were conducted with quite as much dignity as the similar political conventions of their elders.

One of the prominent figures at the first gathering which resulted in the founding of the National Amateur Press Association was a bright spectacled boy of fourteen who is now the Hon. James M. Beck, Solicitor General of the United States, then as now distinguished for his eloquence. It is interesting to note that a number of states were represented at this first gathering of the boy journalists of the period. In that year more than nine hundred papers were printed.

These conventions usually occupied three days, concluding with a banquet on the third day. Here the eloquence of the boys found opportunity for exercise. At the third convention held in Chicago a toast to which response was made by one of the most eloquent of these youths was: "Professional Journalism—may Amateur Journalism so progress that the sire will soon recognize the son."

There were editorial spats among the boys in which heavy sarcasm was dealt in imitation of their elder contemporaries. Here is a sample:

"In the *Union Lance* with reference to the *Brilliant's* criticism, Mr. Kempner declares that 'an accurate idea of the architecture of St. Paul's Cathedral could not be gained by an examination of a piece of its brick.' The force of this argument may be better understood when he shall have shown that the famous edifice is built of *brick*."

And here is another:

"The sickening conceit which is allowed to crop out in this article and undermine the little ability that has found its way into it shows that the author is either passing through his second childhood or believes that he may hide behind the pillar of fame his real worth has built up for him."

A rather neat admixture of praise and blame!

In addition to the thousands of papers published during the three decades dating from the 1876 convention were hundreds of little books from the amateur press. These were printed mostly on the little presses set and run off by their aspiring authors. The Dime Novel period was on and some of these books, crudely printed and often crudely written, show the influence of one set of professional writers of that day, Sylvanus Cobb, Ned Buntline, T. C. Harbaugh and others. Here is one with an alliterative title that may serve as a specimen, "Rope and Rifle, or the Rough Riders of the Rocky Road." Some bear titles less "lurid," where the influence of Oliver Optic and Horatio Alger is more marked, "John Wilkens Good Fortune," "Camping Out, or Adventures on the Lake," "Dick Marlowe, a Story of School Life," and hundreds, perhaps thousands, of others. These books are tiny paper-covered things, some crudely illustrated, but they are eloquent of boyhood industry and nascent talent.

Oliver Optic (William T. Adams), a popular author for boys at the time, whose vogue has now passed away, was the patron saint of amateur journalism. He edited a magazine in the sixties and late seventies known as *Oliver Optic's Magazine*, and his comments were helpful to these youthful journalists in whom he manifested a fatherly interest.

Not all the books that issued from the amateur press were of the unimposing character of those mentioned. Some were quite impressive. Especially is this true of a volume of more than five hundred pages entitled "Literary Cyclopedia of Amateur Journalism," published in 1891. The glories of boyhood journalism were fading and this volume fittingly celebrated its sunset. In it are specimen essays, poems and stories from amateur writers of the two previous decades. In bulk the literature is imposing; in character it is by no means without promise. The poetry of one of the young writers listed in this volume, Fanny Kemble Johnson, stands out for its extraordinary beauty and finish. Miss Johnson, on growing to maturity, contributed verse to the higher class magazines, *Harper's* and the *Century*, and these were characterized by the same felicity of phrasing. In 1889 Miss Johnson won the Poet Laureateship of the National Amateur Press Association in competition with other aspirants for the honor.

Laureate awards for poem, essay and sketch were made annually for many years. Charles A. Dana was selected as the judge of poems submitted one year and the entries for the title were so bad that Mr. Dana positively refused to decide which was the least poor of the lot! This drew down upon him the abuse of the youthful editors, who contended that it was the judge's duty to decide solely upon the comparative merit of the entries without regard to their general quality. This contention seemed not unreasonable, but the boys were unfortunate in having caught the distinguished journalist in one of his irascible moods.

The girls who edited and published little papers were few as compared with the boys. But one little girl of fourteen who hailed from Elmira, New York, was actually one of the pioneers in juvenile journalism. *The Youthful Enterprise* was a large-sized paper of eight and twelve pages. Miss Adams did the typesetting as well as the editing of her journal, and attracted wide attention in the professional press.

In 1873 amateur journalism was represented at the Vienna Exposition by four boys who crossed the ocean, carrying with them press, type and similar equipment. *The American Youth* was printed and issued every Saturday during the period of the Exposition. It was scanned with suspicion by the authorities but with delight by the American visitors. The enterprise was hailed with enthusiasm by the boys at home, and the incident served to draw public attention to the institution of boy and girl journalism.

What became of the graduates of this great practical university, this mimic world of journalism and politics? How have these boys acquitted themselves in the more serious activities of after life? About a third of them did become writers, journalists, managers or owners of publications, and a surprising number became noted in other ways.

Among the boys once active in amateur journalism who afterward became owners of great publications is Cyrus H. K. Curtis, proprietor of the *Ladies' Home Journal* and *Saturday Evening Post,* and Edwin A. Grozier, of the *Boston Post.*

Among other publishers are Charles Scribner and John Moody, and among editors are Charles Stokes Wayne, of the *Smart Set,* William Henry Siviter, of the Pittsburgh *Chronicle,* and Stephen J. Burke, of the Philadelphia *Public Ledger.*

Among authors is Burton E. Stevenson, librarian of the Chillicothe, Ohio, Public Library, and better known as the writer of a number of boys' books and a recent anthology known as "The Home Book of Verse," which has been highly praised by the critics. Another distinguished graduate of amateur journalism and perhaps the best known librarian in the country is John Cotton Dana, of the Newark, New Jersey, Public Library, and the author of a number of books, pamphlets and magazine articles.

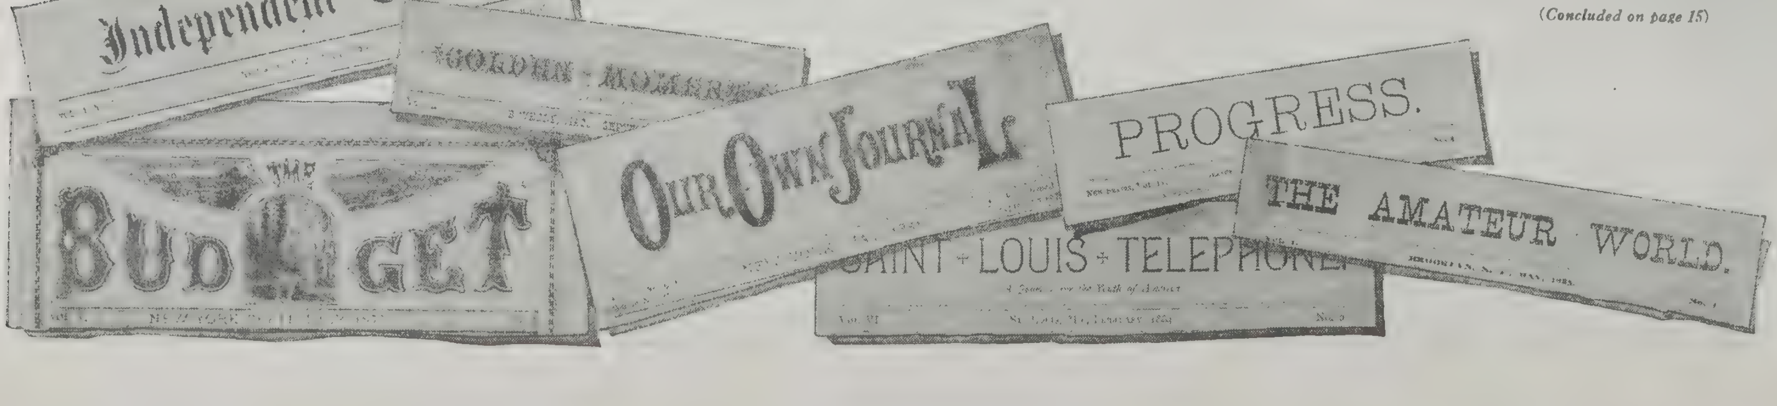
Among dramatists is Augustus Thomas, and among legal lights are James M. Beck, Frank White, author of a number of well-known works on corporation law, Moses H. Grossman, and others less prominent.

Many of these former boy journalists are found active in public life. Among these are United States Senator Moses, of New Hampshire; ex-Governor Sproul, of Pennsylvania; Fourth Assistant Postmaster Billany; former State Senator Metcalf, of Washington, now vice-president of the Scandinavian Commission which sailed this summer to gather statistics on industrial conditions; Henry L. Bryan, of the State Department at Washington, in whose arms Thomas F. Bayard breathed his last; Colonel William C. Brown, attached to President McKinley's staff, who was present at the deathbed of the martyred Chief Magistrate; Alfred Holmead, of the Interstate Commerce Commission; former Secretary of the Navy Josephus Daniels, and many others.

Among clergymen prominent in their localities are Rev. Howard Taylor, of Chicago, Rev. Frank C. Wicks, of Indianapolis, and Rev. Father Uncles, of the Epiphany College at Baltimore, Maryland, the first colored man in the United States to assume the priesthood in the Catholic Church.

Among distinguished physicians is Dr. Charles W. Richardson, of Washington, D. C.

(*Concluded on page 15*)



Mr. Ford's Page

THERE was probably never a younger generation that did not have to endure the judgment of being morally inferior to, or at least more careless than, its elders. One of the signs of adulthood seems to be a conviction that the generation which is following along after is certain to give the world another kick down the slopes of perdition. It always has been so, it is so now, and presumably it will continue so for some time.

Not that this point of view is shared by all, though it does seem to be the natural and majority point of view. There have been others who have seen the matter in quite another light, for whom the onsweep of the generations is the ground of highest hope. Looking at the adult world many have been impressed with the difficulty of greatly changing it for the better. There is a "set" about maturity that is almost impossible to revise. So many people cease to grow and begin to harden. "Settling down" is so often a fatal process, a negation of life. But with the pliable new generation, open-minded, sensitive, responsive, the outlook is so different that many have seen in youth the hope of the world.

Mystery and miracle mark the generations anyway. Out of the Invisible they come, like successive human waves washing up on the shores of time and experience. In their helplessness they are the care of the generation that preceded them; but hardly are we aware of them before they become our challengers. The elders think their age gives them authority; Youth knows no authority but that which cannot be evaded—the authority of character and real knowledge. And so the combat begins early—Authority vs. New Life. And the elders feel aggrieved, while the younglings see in that disappointment the first proof of their power.

What the elders fail to see is perhaps the greatest folly of all—the folly of adulthood assuming proprietorship over the world that is to be. The follies of youth are hardly comparable with it. Youth, lacking the channels of publicity, has no way to make its opinions felt, but enough is known of the new generation to make it clear that if the elders have their complaints about youth, Youth also has its complaints about the elders. The two worlds criticize each other. And if it is entirely proper in one, it is not entirely disrespectful in the other.

YOUTH should not be slandered. Boy nature and girl nature are less repressed and therefore more wholesome today than before. If they at times seem unimpressed by their elders, it is probably because we make a matter of authority what should be a matter of conference. These young people are new people, sent to this scene by Destiny to take our places. They come with new visions to fulfill, new powers to exploit. Precious little shall we leave them because our world is not the world they want; they will build their own new world, even as we built ours. If, however, youth were keen to save time and suffering, there is something to its advantage in gleaning the wisdom its elders have won. The rung of the ladder that lifts one is not to be spurned.

The situation is painful because it is not understood. And it is not understood because of the notion we entertain as to who these children are. We think they are creations of ourselves when in fact they are new people, entirely new people, as new in their time as the people who industrialized this country were new in theirs. And thus destined to be misunderstood. Whoever they are they are here, and theirs is the world of the future, and the world of the future will be greater far than ours. That fact in itself should engender a respectful attitude toward them.

If we are not quite capable of that height, there are at least the facts of the situation. And the facts indicate that, so far as badness goes, the nature of the youth of today is not bad. In fact it is the very lack of badness that is the constant marvel, considering the conditions which evil imaginations have created. Boy nature and girl nature is just what they ever were, if anything perhaps a little better today than before because of the disappearance of so much of the repression that formerly oppressed youth and tantalized it to break out recklessly.

We fancy that boys are wrecking themselves via the cigaret route and that girls are following suit via the dance route, and yet it is reported that only thirty per cent of Harvard students smoke, while for the vast majority of young girls a dance is a rare experience. In some circles, of course, it is credibly reported that the social life of the young goes on with little supervision, but this is not to be put down to the account of youth, it is plainly proof of the negligence of adults. People who have lately made money, and who are striving to live after what they think are the habits of the rich (as those habits are portrayed in the movies) have always been in the world, and to exalt their lack of balance as likely to upset the world is to credit them with a little too much weight.

It is rather strange what different views different minds take of the matter. Wholesome minds invariably find the majority of our young people entirely wholesome, while unwholesome minds nurse their own suspicions. This is not at all to minimize the tragedies of youth which are known in all our cities, but it is decisively to say that Youth-at-Large is still hedged about with those God-given defenses which only long and hard worldwear can weaken.

One thing seems clear: the habit of elders issuing orders for youth to obey has become obsolete. If the generations are to get together, they must confer. If the elders have anything of value to pass on to their juniors, it must pass because of its value, or not at all. Maturity should be trustworthy and gray hairs should be wise, but as it is not always so the young are justified in looking beyond mere age to reasonableness and worth.

Still, it should be whispered to youth that it would be worth while to confer with its elders. In driving along a strange road we are glad of information from travelers who are familiar with it. Life is that road, and adults have traveled farther on it than youth has done, and if there are chances of disaster which can be avoided by knowing of them beforehand it is just as well to know about them. This, however, is not the imposition of authority, it is imparting knowledge in conference. If adults have not always known how to talk to youth, youth has failed in keenness by not knowing how to listen. It is better to learn what can be learned by listening, than to learn by needlessly hard experience.

Quite a fallacy hangs round that idea of "learning by experience." While it is true that the whole sum and purpose of life is to give us experience, it is not necessarily the *duplicate experience* which could be had another way. There is no need to repeat all the errors of humanity to learn the elementary wisdom of humanity. Progress is made by beginning where someone else leaves off, not by repeating all that other's previous mistakes.

As a matter of fact, is it not true that in the majority of instances where we use that phrase "learning by experience," it relates to mistakes, rather than to progress? Why should we always relate experience to some sort of failure? Is not success an experience too? Is not regularity of life an experience from which a man can learn something, as well as folly of life?

The Good Book speaks of a "wisdom that is from above." That is to distinguish it from a wisdom which is from beneath. The wisdom or experience that comes from beneath is the experience or wisdom we get from doing things that are wrong and that mostly we know to be wrong before we do them. The "wisdom that is from above" is a higher wisdom; it does not come through wounds and sorrows, but through doing right things.

That is the kind of wisdom that the elders would like to pass on to youth, so that youth may start without the loss of time in making unnecessary mistakes. This generation, mistaken though some of its methods with youth may be, has no dearer desire than that the coming generation may start in at the point of accomplishment where we leave off. And to do that, this generation would gladly pass on all the knowledge for which it has bitterly paid concerning the ways of life.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Police Protectors of Crime

IT IS not to be supposed that Brigadier General Smedley D. Butler, new head of the Philadelphia police, talks as much as the papers make it appear he does. That would be unlike a United States Marine. It is not to be supposed that he will cure age-old vice in that city. Nor change human nature. There is always so much misunderstanding about these matters that it is necessary to make them clear. The best General Butler or any other public servant can do is to insure that the police of a city do not become protectors of crime.

That was the distinction and the lesson taught the country by the Rev. Dr. Charles H. Parkhurst in 1892-1894. This gentleman, zealous for decent moral conditions in New York, tackled vice itself, and found that the first outworks of the fortifications of vice consisted of the New York Police. He then changed his tactics. He went after the police. He insisted that the police force, paid by the city, should be leagued with the city rather than with the enemies of the city. It was a simple demand to make, that police be against crime rather than for crime, but it took tremendous labor, courage, loss and suffering to make that simple point clear.

Men in the uniform of the city but in the service of crime are a double danger, and there is reason to believe that this attitude is more widespread than most people are aware.

It is probable that crime, in all its phases, can never be stamped out by any exercise of authority. It may even be regarded as an absolute impossibility. But certainly it is not impossible to have a police force lined up against crime, instead of for crime—and if even this much could be achieved, conditions in our cities would change amazingly for the better. This much is absolutely true: There is no city in the United States that would not be immeasurably safer and cleaner if its police force were morally and actively against crime. No police force of any large American city is exerting half its power for law and order. The plaint of powerlessness on the part of police anywhere is a concealed confession of confederacy with known crime and criminals.

A Rich Beggar

SENTENCING Samuel Shapiro, a wealthy beggar, to jail, a New York magistrate directs attention to a growing peril of the American city. Professional mendicancy has no place in America, but it is becoming an extensive business. The alms seeker of the Orient, and the ragged beggar of the European slums has his replica in every large American community. Hard times or good times, the panhandler plies his trade. And, if the case of Shapiro is any criterion, the trade is an unusually lucrative one.

Shapiro has been in the begging business for seventeen years. He refuses to give it up. He looks forward to the future as holding forth opportunity for the greatest profit, for an old beggar attracts more tender and profitable sympathy than a young one.

The American Government, founded upon industry and energy, has been singularly lax in applying remedial measures to the evil of mendicancy. Only one state, Massachusetts, possesses a labor colony which deals with any degree of success with the parasite. Other states punish idleness merely by imposing more idleness on the offender. That is: the mendicant, sentenced for begging, is merely sent for a short term to some house of correction where he has no work or little work and where he is provided with warm quarters, adequate food and other necessities of life at public expense.

A short term under such conditions is no deterrent to such an offender. The shame of a prison sentence is generally considered a far greater deterrent to crime, than the hardship of actual confinement. In a professional beggar, a sense of shame must be a minute quantity.

Tax Reduction

REVISION of the revenue laws and reduction of taxation will be of no lasting benefit to the country unless the taxation remains lowered. A reduction in this year's taxes to be followed by a deficit and a consequent increase in next year's levy would be worse than useless.

It is to be assumed that the Treasury Department's estimate of the amount that taxes can be lowered is based on the best estimates possible. But assurances that lower taxation has come to stay can only lie in a gradual tightening of the expenditure limits, the steady elimination of unnecessary Government bureaus, and the practice of wise economy all along the line.

The first report of a Congressional Committee on an appropriation measure is a satisfying indication that Government is moving in the right direction. The Appropriations Committee of the House of Representatives reported the annual supply bill for the Interior Bill, after having slashed budget estimates by $10,000,000, making the amount recommended for the operation of the department during the next fiscal year $35,792,044 below the appropriation made for the department's activities during the present fiscal year.

There are points below which reductions in revenues cannot safely go. Government functions must continue, and their continuance will always cost money. But the limits of reduction have not yet been reached.

Knee Breeches

THE decision of Ambassador Frank B. Kellogg to abolish knee breeches as court costume at social events in London is more than a subject for humorous comment by paragraphers. It is a display of common sense of so common a variety that it is strange that an American envoy had ever adopted a different form of dress.

Ben Franklin, American representative at the most voluptuous court of his day, was not called upon to wear a costume out of keeping with the styles of his country. Yet, he was able to establish American diplomacy on a plane on which the ablest diplomats of the Old World were pleased to meet him.

American diplomacy requires no uniform. American envoys, in the correct dress of their own country, will be welcome at the most brilliant assemblage of a European court. Their garb will be distinctive and a distinction among the brilliant uniforms and bemedaled fronts of the envoys whose showy elegance is in striking contrast to hungry and suffering peoples in debt-ridden, army-surfeited homelands.

Small Town Has an Idea

CITIES, towns and lesser taxing districts are beginning to feel the burden of bond issues, but not quite so much as are the bond brokers themselves. The feeling grows constantly that the bond structure is top-heavy, too weighty for the foundation. Debt is always bad, and there comes a time when it ties itself into a double knot; the world cannot continue indefinitely to spend its productive energy in paying interest which does not diminish debt.

A Massachusetts town, face to face with facts, has not flinched their implication. It had to borrow money; taxes in hand were exhausted. The ordinary course was to borrow from Boston bankers and pay handsome interest. The mayor, however, had another thought. Why not ask the citizens to pay taxes in advance, in weekly or monthly installments, and let the city pay the citizens a reasonable amount of interest for the advanced payments?—thus doing two things—first, putting the town upon a pay-as-you-go basis; second, keeping the wealth represented by interest in the city.

The time is coming when practices based on this principle will be common in America. Instead of borrowing, cities will begin saving. Nowadays when a public improvement is to be made, bonds are issued and the improvement paid for *twice*. In the future, towns and cities will "save up" for what they want to do, and pay for it *once*. A bond issue at five per cent for twenty years is *double* the amount needed. It is too much, and the world cannot go on that basis forever. This may seem a slower process, but it is sounder, and it has the advantage of making the people realize the cost of things which are now so easily disposed of by a vote for a bond issue.

All this, of course, supposes an intelligent and informed electorate, which many contend is not in existence as yet.

Debts of the Public

HOW MANY kinds of public debts are there in the United States? The Census Bureau gives us an idea in its recent statement. There is first the debt of the national government. Then comes the debts of the state governments. Next in order come county debts, city debts, towns, villages, school districts, townships, drainage districts, park districts, with here and there still other governmental units empowered to incur indebtedness.

The debts carried by all these governments in the United States amounted in 1912 to $6,814,955,000. This had grown in 1922 to $32,786,715,000. The increase represents 381 per cent. The per capita debt rose in that period from $70.20 to $301.56.

The debt of the national government alone advanced in the same period 672 per cent.

That the reader may see what is meant by warnings against the unparalleled increase of public debts, the division of responsibility is given as follows:

National debt	$22,525,775,000
State governments	1,162,648,000
County governments	1,366,636,000
Cities and others	7,731,658,000

The interest is more than One and a Quarter Billions of Dollars a year.

Schools Belong to the People

THE schools of the United States should remain in the hands of the people. The appropriation of $100,000,000 for the creation of a Federal Department of Education is a move to take the schools out of the hands of the people. When this is done—although it is hardly conceivable that the American people, once they understand, will ever permit it to be done—almost our last vestige of true popular government will have vanished. The Towner-Sterling Bill proposes to do nothing that is not already being better done by cities and states; so that the Bill becomes an attempt to Federalize (it would be permissible to say Prussianize) the public school system. Every one knows the potency of that word "Federal," and how Federal bureaus gradually usurp control of matters belonging to the local community. We have only to note the vast misuse of "Federal" in the title of the Federal Reserve System, to learn what it leads to.

The religious arguments for and against the Towner-Sterling Bill have no place here. There is a strong religious argument against it. The argument for it is frankly anti-religious. Just at a time when good citizens everywhere are proposing to put the American Public School back on the sound basis of religious and moral instruction which originally made it great, other forces—anti-religious to the core—arrive with a proposition to take the school out of the hands of the local community and place it in the hands of bureaucrats at Washington.

It is repeated: the Bill proposes nothing that is not now being done most effectively by the local community. Its entire effect would be to take the schools out of the hands of the people. It is time for the people to demand that some shred of self-government be left to them.

It would appear that the end of Albert D. Lasker's influence in the Shipping Board has come at last, and through the direct personal interposition of President Coolidge. The elimination of Mr. Farley as Lasker's successor and heir of the Lasker policies is the guaranty of the end. And lest the result be merely negative, the President has appointed Rear Admiral Leigh C. Palmer, U. S. N., retired, to the sole control of the active branch of the Shipping Board, namely, the Emergency Fleet Corporation.

This appointment is to be commended. Indeed, the touch of wise certitude which is coming to mark the President's grasp of all the tangled situations which fell to him to unravel is a great relief to all. That a braggart from Chicago should ever have been placed at the head of the world's greatest shipping concern is one of the unexplained stupidities of our recent political history. It is explainable only on the theory that Lasker must have helped the Republican National Committee out of some of its indebtedness.

Speaking of the Navy, it is also reported that the President has inquired what ships can be found to scour the coast for rum-runners. If the President is seeking Navy vessels for the enforcement of prohibition, there is hope that he may go further some day and show the police forces of the country what the Army could do in the way of efficient clean-ups within our great cities. The suggestion that the Army and Navy be used to give object lessons is not so wide of the mark as certain rum-interested persons pretended to believe.

What They Told After Taking "Truth Serum"

An Eyewitness Account of Administering of Scopolamin to Accused Pair

By CLYDE ROBERTS

WITH the right sleeve of their shirts rolled to the shoulder, Blas Castillo, a Mexican laborer, and Link Sykes, a powerful, stalwart Negro, faced three surgeons in the medical ward of the Wyandotte County, Kansas, jail one evening a month ago.

"I'se ready," said Sykes.

"Si, señor, la mismo," Castillo murmured.

They were the first two subjects in the state of Kansas to receive of scopolamin, widely known as "truth serum."

Dr. R. E. House, of Ferris, Texas, discoverer of scopolamin in criminal work, stepped up to the patients. From Dr. Francis S. Carey, Wyandotte County official physician, he received an hypodermic needle. Then Dr. Frank Cross, of Kansas City, Kansas, took the Negro by the other arm and motioned him to lie down on the regulation cot in the medical ward.

Dr. House administered the first injection of the mysterious "truth" drug into the Negro's arm. The same process was followed with the Mexican.

As the two patients lay quiet for the drug to take effect, authorities stood about the room in little groups wondering what the next two hours held in the way of surprises when the experiment would be in full swing. The two patients were the twenty-sixth and twenty-seventh patients to undergo the scopolamin treatment in the United States.

For the benefit of the medical men present, Dr. House explained what he proposed to do.

"In an hour from now, or two hours at the most, these two prisoners will be as helpless as children in our hands," Dr. House said. "They will be utterly incapable of telling a lie and they will readily tell the truth and nothing but the truth."

Convicted of Murder

THE Negro was under conviction for murder of a street car conductor and the Mexican was in jail awaiting trial on a charge of attempting to dynamite a Santa Fe passenger train a few miles west of Kansas City. He was a government prisoner and had not had a hearing on the matter, being held in jail in default of bond.

Castillo was a laborer for the railroad company. When the heavy passenger train was derailed, investigation revealed that spikes holding the rails had been deliberately pulled out with a large pinch bar used for such purposes.

Such a bar was stolen from the tool house of a section gang in which Castillo worked. Bloodhounds were brought into the investigation. They followed a trail from the tool house to Castillo's house one-half mile away, then back to the scene of the wreck.

His arrest resulted from the action of the dogs. At the time of his arrest he had in his possession one-half pint of corn whisky. That constituted a violation of the Kansas bone-dry law.

Thirty minutes passed and Dr. House administered another injection of scopolamin into the patients' arms. He waited a few minutes and then began the first stages of the test which he characterizes as the "House receptive stage."

Calling sharply to the Negro to open his eyes he asked, holding a fountain pen before the patient's eyes:

"What have I here?"

"Fountain pen," said Sykes.

"And what's this?"

"Watch."

"And now what have I?"

"Package of cigarets."

"Do you know what this is?"

"Spoon."

The same process was tried out on Castillo who, to the surprise of those present, answered the questions in English instead of Spanish.

"That," said Dr. House, "is the first stage of the memory test."

Are Given Chloroform

TEN minutes more passed and Dr. House asked each patient to name what articles he had shown them. Sykes remembered the spoon and nothing else. The Mexican remembered every article.

Dr. Carey and Dr. Cross then drew out a hood for administering chloroform.

"To remove any possible doubt that these patients may have the slightest possession of their mental faculties," Dr. House went on, "it will be necessary to chloroform them into unconsciousness."

The patients, who were already in a stupor, soon were chloroformed.

"Now," Dr. House continued, "somewhere between now and absolute awakening from the effects of these drugs will be the receptive stage when they can do nothing but answer every question truthfully.

"The point is this: any person, to tell a lie, must first think of the truth in order to apply reason to his lie. These men will be unable to think fast enough to invent any lies and the truth which is in their minds will come out without their being able to prevent it. Scientifically, scopolamin paralyzes all of the senses and the sense of hearing is the first to recover from its effects. With that sense recovered and the other senses stupefied it is possible to register the questions on their minds and compel answers by talking.

"There is nothing scientifically mysterious about the experiment. It is simply the use of scopolamin to produce a stage of mentality in which nothing but truthful answers can be obtained. These two men are unconscious. We will soon begin the experiment to ascertain if their sense of hearing is awake and their ability to talk sufficiently recovered for them to frame words. Neither knows where he is nor what is going on about him."

Advancing to the Negro's cot, Dr. House spoke in ringing tones:

"Link, how old are you?"

The thick lips of the patient responded instantly with some queer mumbling.

"He's coming very well," Dr. House observed. "Soon he will have enough control of his muscles to speak and then we will hear the truth."

The little group then moved over to the cot where Castillo lay.

"Mexican, what is your name?" asked Dr. House.

"Blas Castillo," came the reply instantly, clear and distinct.

"How old are you?"

"Twenty-eight."

DR. R. E. HOUSE,

Originator of the scopolamin "Truth Test."

Then Dr. House explained that Castillo was an ideal patient for the experiment and that the conscious mind of the patient was inactive.

"Where were you born?"

"In Mexico."

"Where are your parents?"

"They are dead."

"Mexican, who told on you and got you in this trouble?"

"That four-eyed fellow makes the charge against me."

It was explained by the arresting officers that a railroad special officer who wore glasses was responsible for Castillo's arrest.

"Why did they arrest you?"

"The dogs came to my house."

"Did you try to wreck the train?"

"No, sir, I know nothing about it."

"Do you know who tried to wreck the train?"

"I know nothing about it; nobody ever said to me anything about wrecking the train; the dogs came to my house."

Answers Are Identical

AT THIS point the jail identification card, used to record Castillo's weight and description and other facts required of new prisoners, was produced.

Dr. House asked every question on the card and received identical answers given two months before by the prisoner.

He then assembled the medical men about the cot and explained that Castillo was unconscious of the answers he gave and told them to experiment to make certain that the patient was unaware of what was going on.

Spectators lifted the patient's arms and let them fall. They never moved from the position to which they fell. One spectator raised the patient's arm above his face and let it fall, striking him square across the nose. He made no sign of having felt the blow. He was pinched violently on the neck but still remained utterly oblivious of anything touching him.

The group then moved to the Negro's cot. By this time Sykes was in the receptive stage. He answered questions readily but with a far less degree of intelligence than the Mexican. He answered the identification card questions correctly, giving the same story of his relatives, age, occupation, and so forth, as verified by the authorities. He told of having been arrested three times for the murder of which he was convicted and of two releases by the police when identification could not be made.

The victim of the murder was a street car conductor who sought to make his assailant pay his fare. A fight followed in which the Negro stabbed the street car conductor.

"Why did you kill this street car man?" Dr. House resumed.

"I did not kill anybody, sah. No, sah, I nevah killed anyone."

"Who told on you?"

"I don't know, sah, the police came to the house where I was staying and took me in. Then they turned me loose and took me in again about two weeks later. Then they come and took me in again and here ah am."

"Do you know who killed the street car conductor?"

"No, sah. Ah was at a girl's house with mah head on her shoulder when another boy came there and told me a man had been stabbed up at the corner."

"Who was this other boy?"

Sykes instantly gave his name, a name, prior to then, unknown to the police in connection with the case and a man whom the police sought on another matter.

Reveals Liquor Source

TO A series of questions about his love affairs, which caused Sykes to smile broadly, direct and positive answers were given. Some of them were quite embarrassing.

The test on Sykes was far from being as successful as the experiment on the Mexican.

Returning to Castillo's cot, Dr. House asked:

"Blas, where did you get that liquor?"

Castillo instantly gave another Mexican's name.

"How much did you pay for it?"

"Fifty cents."

"Did the other man make the liquor?"

"I don't know, but I think so."

"Did you drink the liquor?"

"Only one drink for a cold. I don't drink."

"Are you angry at the Santa Fe?"

"No, sir."

"Was the section boss going to fire you?"

"No, sir."

"Were you ever arrested before?"

"No, sir."

"If you know who tried to wreck the train, why don't you tell it and get out of this jail?"

"I hear nothing about anybody trying to wreck train until the dogs came to my house."

"Were you at the wreck?"

"Yes, sir, I lived right near there."

Dr. House proceeded with many other incidental questions, many of which were often repeated and the identical answers given on each occasion. The Mexican told a story which apparently will be his defense in court when his trial comes up.

The next day the same questions were put to him after his complete recovery. He answered all the same except one.

When asked where he got the liquor he said he believed another Mexican had given it to him. When that man was named he appeared surprised and said he only understood that the man named had the liquor. Possession of liquor might have caused a bone-dry charge to be filed against the other Mexican.

The Future of "Serum"

THE next day the Negro answered the questions about the same as when under the influence of the drug.

One peculiar feature about his denial of the crime was that he used the same tone of voice with the same inflection when asked directly why he killed the street car conductor as he did when under the influence of scopolamin.

At the conclusion of the experiment Dr. House said he was convinced of the innocence of the Mexican. He also said that he believed there was a strong probability of Sykes being the wrong man, although he was not entirely satisfied with the experiment.

Sykes received a ten-year sentence in the penitentiary. His attorney raised the "truth serum" test in a motion for a new trial but the judge took no official cognizance of it and overruled the motion.

Dr. House said that through scopolamin experiments two innocent men had been exonerated of crime when authorities investigated their stories and found ample evidence to establish their innocence. He also said that two guilty men were brought to justice through its operation and that it had been the means of gathering evidence against crooks in crimes committed by them and revealed by a patient undergoing treatment.

Whether the receptive stage of scopolamin treatment ever will become a part of criminal work of authorities is a question, but it made a strong impression on all who saw the experiment.

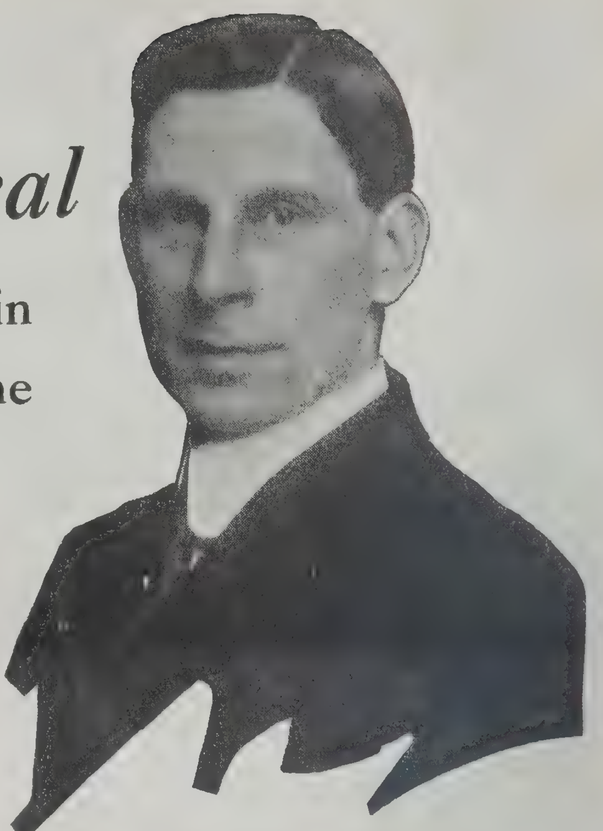
There is a mooted question about its operation. Some say a patient undergoing treatment will answer the impressions most strongly in his mind. Dr. House says that cannot be done.

What will the future hold for scopolamin? Who can tell?

Training for All Students Stanford's Athletics Ideal

Competition With Other Institutions Incidental in Program Designed to Furnish Sports for Everyone

By ANDREW R. BOONE



RAY LYMAN WILBUR,

President of Stanford University.

THE old order passes on. New systems and methods supplant the time-honored, almost stereotyped, processes so long used in training men to think. So it is with the training of young men's physical bodies.

Out of the highly competitive order of intercollegiate athletics, Stanford University has thrust her head up with a new ideal. Intercollegiate athletics are now a means to an end as well as an end in themselves. Athletics for the masses is the goal toward which this great western university is striving. Competition with outside institutions is becoming more an incidental part of its athletic program.

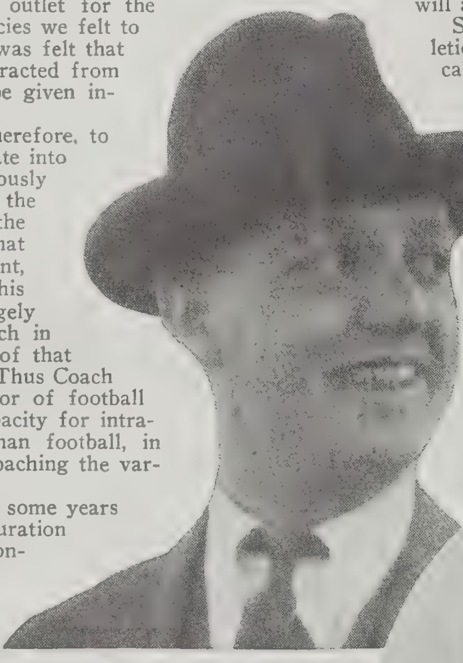
How, the rest of the university and college world asks, will this California institution maintain its place in public esteem if it deserts the old order and strikes out alone, promising a physical education to its students as one of the most important elements in the educational scheme, instead of, first and foremost, winning teams?

The solution is found in the attitude of President Ray Lyman Wilbur, of Stanford, whose idea it was to make athletics easier for the many instead of restricting it to the qualified few.

"The policy of activity for everyone in sports," explained Dr. Wilbur recently, "was started several years ago, but it is just bearing fruit. There was at first, especially among the alumni, prejudice against intramural athletics as an outlet for the athletic abilities and tendencies we felt to be on the campus, since it was felt that the intramural athletics detracted from the attention that should be given intercollegiate athletics.

"It has been my aim, therefore, to get every male undergraduate into some sport, which is obviously the right principle, but at the same time so to correlate the two branches of activity that instead of being a detriment, one would help the other. This has been accomplished largely by having the varsity coach in each sport act as director of that sport for all the students. Thus Coach Andrew Kerr is the director of football and acts in an advisory capacity for intramural football and freshman football, in addition to handling and coaching the varsity squad.

"The policies established some years ago at the time of the inauguration of the board of athletic control are now being realized. There has been a considerable readjustment in the personnel and arrangement of the staff of Encina Gymnasium. Practically all of the athletic staff is now on full time appointment for a period of years. This insures stability. It was inevitable that during and following the war transient plans had to be accepted. Dr. W. H. Barrow was appointed as Professor of Physical Training and Medical Adviser of Man, and a staff of well-qualified men in the different fields of sport makes it possible for mental and physical training to proceed harmoniously. Only those who are real educators and who understand thoroughly the elements of the sport in which they give instruction are capable of training men or of coaching teams. There is every reason for installing the same standards of efficiency in this field as exist in the rest of the university."



PAUL H. DAVIS,

Graduate manager of Stanford University, who is engaged with direction of the physical plant and finances of Stanford's athletic department.

The function of the coaching staff, while fundamental in the correlation of the branches, is to all practical effects, a minor one. The students themselves are vested with the initiative and responsibilities of the system, which has caused Stanford already to outstrip any other college or university in America in her progress and in interest created in athletics for the whole student body.

At the basis of the plan which gives the student body virtual control over the coaches who are paid by the university, is the board of athletic control. Three of its nine members are students, and though in the minority, their wishes are considered in all matters of decision or policy, since it is to the student body that the officials of the university look for co-operation in any new ventures.

All coaches and members of the staff of the physical education department are members of the faculty, responsible to the president of the university through the director of physical education, Dr. Barrow. The director of physical education occupies a dual position at Stanford. Where, in most institutions, there are two departments, the department of athletics, with coaches hired and paid by the student body, and the department of physical education with directors hired by the university, at this Princeton of the West (as it is so often called) there is the one department. It functions entirely as a unit of the university, and instead of two controls, control rests with the president, who acts through the director.

The director of physical education is appointed by the board of trustees on the recommendation of the president. Coaches and other members of the staff are appointed by the president, an ex officio member of the trustees, on recommendation of the director of the department and the board of athletic control, which is made up of three faculty members, three alumni and three undergraduates. Faculty members are appointed by the president, the alumni members elected by the alumni executive committee and the students elected by the student body.

This system gives those in the university who are interested an active voice in the personnel and conduct of the athletic affairs and at the same time leaves in the hands of the president of the university and the board of trustees a practical check on the situation.

So much for an explanation of the machinery of administration, which will interest coaches and college executives the country over. It is the viewpoint of these western educators and the actual physical plans they are making for the future college generations which will astound adherents of the old school.

Stanford has already built a dozen athletic fields for present and future use. Plans calling for extensions which will ultimately cover one hundred and forty-nine acres of ground near the heart of the 8,000-acre campus, lie on the desk of Paul H. Davis, graduate manager, today. The opinion that through competitive athletics men can be made bigger and stronger has so imbued everybody from the president down, that nothing will be allowed to retard the new athletic progress.

Easterners will find it difficult to grasp this viewpoint. Competition for athletic supremacy there is even keener than on the Pacific Coast. The theory that athletics is for the benefit of the whole sounds very pretty, but to sacrifice possible supremacy on the gridiron, the basketball court and the baseball field—absurd!

DR. W. H. BARROW,

Of Boston, director of physical education at Stanford University.

Nevertheless, the Stanford authorities shut the door to objections and criticisms they knew were coming, and two years ago announced to a doubting West what was on their collective minds. They were willing never to have another winning team so long as Stanford men of the future would possess that stamp of strength which comes of continued physical competition; but they were equally sure their proposed change would bring both men of strength and winning teams, the latter as a natural concomitant of the former.

And so they set about to teach the students to train themselves physically as well as mentally, doing away with a paid tutor to show them each and every step they should take in gymnasium and on fields.

The two most obvious steps in this direction were taken. Men whose human elements matched their acquired qualifications were selected to become permanent members of the coaching and teaching staff. By reorganizing the physical department the permanency of the plan was assured. With a new staff, engaged from both eastern and western sources, thought was directed toward necessary changes in the physical plan. Mr. Davis, then an engineering student in the university, devoted many nights to specifications and drawings and when he recently was installed he offered for consideration by the president and others in authority a scheme providing for full development of 149 acres to be devoted exclusively to competitive athletics. Under that scheme, this is what Stanford will soon have, including the fields already in use: Ten football fields, twenty-six tennis courts, two swimming pools, two soccer fields, six baseball fields, two polo fields, eight basketball courts, eight handball courts, six volley ball courts, two running tracks, two boxing rings, two wrestling rings, one fencing room, one gymnasium, one cross-country course (three miles, all on the campus).

The present stadium of 62,000 capacity will be in the approximate center of the area, flanked on three sides by baseball, football and soccer fields. New dressing rooms are to be erected as a part of Encina Gymnasium, which quarters the coaching staff and locker rooms for men taking part in all sports. Of the total proposed plant, there is already in existence eight football fields, fourteen tennis courts, one swimming pool and about sixty per cent of the other units named.

While, in the line of grounds and structures, preparations are being made for a male student body of 6,000, or three times the present enrollment, the planners will keep pace with these changes by providing increasing numbers of uniform and physical equipment. During this autumn, for instance, twelve football teams composed entirely of non-varsity men, practiced each afternoon on separate playing fields for intramural matches. Three hundred and fifty men of all divisions appeared for intramural basketball; seventy-five for golf; eighty for handball; one hundred for soccer; like numbers for fencing, cross-country, polo, fall baseball and swimming. And every man of them was furnished with a complete uniform by the university. Not so much as a shoe lace was any student asked to bring with him, no matter whether he was the greenest recruit or an experienced player.

Once the intramural sports are given a little incentive, they roll along by their own momentum, and the coaches find more time to direct the teams being prepared for intercollegiate competition. While it is true the university is working whole-heartedly for "Athletics for all," the plan is working out so successfully that already a decided improvement in teams representing Stanford is noted over those of the last few years. With such continued improvement as reasonably can be expected, the institution will not lose an inch in intercollegiate competition, but rather will show a continued steady rise.

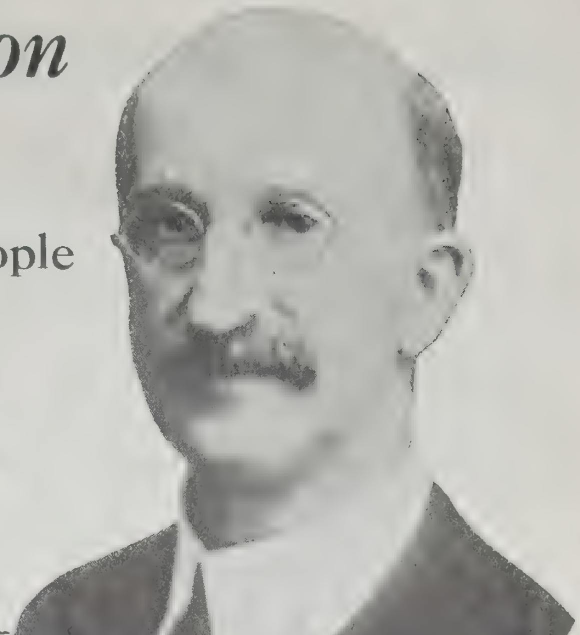
Stanford has been noted in years past for the intense spirit shown by the student body in supporting its teams. That intangible something was doomed for complete destruction with the advent of the new plan, according to standpatters who were for the good old-fashioned way of doing things, at whatever the cost. But their surprise can only be measured by the degree to which they admit the favor President Wilbur's ideas are finding.

Promotion of college "spirit," as it is popularly conceived, is the least good the development of college men's bodies can bring about. The comradeship of the field; increased personal efficiency through self-training; greater interest in work both on-field and off-field; development of a sense of responsibility and leadership—these are some of the benefits accruing in place of a potential loss of prestige in the intercollegiate world. Yet Stanford University recognizes no loss in this field.

A Day With the Pastoral Parson

The Many Tasks to Which a Rural Missionary in Connecticut Sets His Hand to Aid His People

By GEORGE S. BRYAN



The REV. GEORGE B. GILBERT,
The "Pastoral Parson."

The Parson starts on a fifteen-mile drive to deliver a baby-carriage.

The Parson's community center at Rockland.

A goodly gathering at Rockland.

SOME two years ago appeared a bulky compilation bearing the inclusive title, "Civilization in the United States." To it, thirty-two writers contributed chapters treating of journalism, education, poetry, business, engineering, art, politics, scholarship and criticism, and numerous other items in the fabric of our contemporary life. But there was no chapter on religion; and the editor, H. E. Stearns, quite properly thought this somewhat odd omission should be explained. He claimed that the one man he could persuade to undertake such a chapter, had been unable to finish it; that he had found nobody else willing to tackle the job; and that, anyway, the folk he consulted appeared to suppose that, despite "the sheer immensity of the physical apparatus by which the religious impulse is articulated," true religious feeling had pretty well vanished from the United States.

"I do not know the method of drawing up an indictment against a whole people," declared Edmund Burke in his speech "On the Conciliation of America." Mr. Stearns having, however, attempted so to do, and being rather despondent about American life in general, left his country for his own good. Had he postponed his departure long enough to become acquainted with the work of the "Pastoral Parson," he might have felt inclined to modify his conclusions regarding true religion.

I first learned of the Parson through the columns of the *Rural New Yorker,* to which he has for some years been contributing occasional letters. It is said that some who read these letters continued to reckon the Parson a literary myth, and his narratives as at least semi-fiction. For the life of me, I don't see why. His paragraphs have always the authentic ring. In their spontaneity, their individuality, their very discursiveness—which jumps from potato blight to denominationalism, from record hens to bishops—they carry their own conviction. They are like leaves from a notebook in which the chronicle of family doings or the memorandum of a good story is mingled with episodes of daily experience or with the observations and reflections that such experience rouses in a thoughtful mind.

One result of them has been to bring the Parson not only letters of friendly inquiry, but visits from all sorts of people who quickly become assured that there is nothing mythical about him and nothing fanciful about his labors. From nowhere once suddenly appeared an intelligent man who said, "I thought I'd see if you were what you represent yourself to be; and if you were, I'd help you with your farm work." Apparently satisfied, he remained, gave good aid for some weeks, and then vanished as suddenly as he had come. During the summer season, the Parson rarely goes his rounds without being attended by one or more persons interested in his methods and attracted by his spirit.

Who is the "Pastoral Parson"? Well, he is the Rev. George B. Gilbert. As for what he is—he is several things: first, a farmer, tilling and living upon well-kept acres near Middletown, Connecticut; then, too, he is a professor in the Berkeley Divinity School in Middletown. When I asked him what he taught, he answered, "I call it a course in gumption." Furthermore, he is a good platform and after-dinner speaker. But mostly he is an Episcopal rural missionary in Middlesex County. It isn't easy to induce him to talk about himself; but I have managed to discover that he was born on a Vermont farm, and was graduated from Trinity College (Hartford) and from the Berkeley Divinity School. He wears a Phi Beta Kappa key, was salutatorian of his Trinity class, and won a scholarship that helped to take him through Berkeley. Physically, he is rather of Yankee type—tall, sinewy, and of great endurance.

I don't know exactly when his interest in rural church problems began; but once interested, he attacked those problems with characteristic good-humored energy. All about him was territory that cried, "Come over and help us!" The more remote places were marked by closed churches, abandoned farms, waste land, poor roads, and pitiful isolation. The Parson mounted an old bicycle and rode forth to do what he might. He has been doing ever since. The bicycle was succeeded by a horse, and the horse has given way to a motor car—except during the winter months, when, over the Parson's route, wagon or sleigh becomes a necessity. The Parson says the motor car has enabled him to cover more ground in less time, and bring to his services bus-loads of people that otherwise would not have come at all.

When I wrote to him that I wished to get a little first-hand material on what he was doing, he wrote back: "Can't you come and go down to church with us, Sunday?" The upshot was that, although I could not go at that time, I did go later and put in a twelve-hour day with the flying squadron of the Rev. George B. Gilbert. He was to hold services that day at Killingworth and Rockland. There were three automobile loads of us; and on the running-boards of the Parson's car were cans of water and coffee, heaping boxes of sandwiches and other eatables, and articles of altar furniture. Before long, we had left the state highway and were going down what the Parson calls the Lonely Road. Lonely, indeed, it was—lonely, tortuous, narrow, and rough. Fourteen miles we went, into a region where is neither railway nor state road, neither express office nor post office. We passed old buildings that had once been stores but now were shut and falling to decay. The farmhouses were few and scattered; woods were overrunning land that had formerly been cleared, and bushes grew thickly by the roadside. At last we halted beside a little old church, neatly cared for and exhibiting interesting details in its interior woodwork. From the steps of this building not a house could be seen.

We were in Killingworth, whose name has been made familiar by Longfellow's "The Birds of Killingworth," in his "Tales of a Wayside Inn." Whatever may have been true in "fabulous days, some hundred years ago" (as a matter of fact, Longfellow drew mainly upon his invention), none need now expect to find in Killingworth such impressive squires, bombazine-clad deacons, and eloquent school-principals as the poet describes. Neither, by the same token, need one expect to find an austere parson, preaching the wrath of God from year to year. From a population of 2,484 in 1830, Killingworth by 1920 had dwindled to 531 in an area of 23,791 acres. There has been immigration of foreigners—Italians, Bohemians, Hebrews, Poles, and others—most of whom came hither from New York City and, either wholly ignorant of agriculture or unused to local conditions, have had their troubles in wresting a living from their scrubby farms.

The Hartford *Times* has stated that when Mr. Gilbert started in, "Some people laughed at him," and that not all among his church associates approved his ideas. The Episcopal church building in Killingworth was closed. The Methodist church building in the adjoining settlement of Rockland (township of Madison) was closed. There was no social or community life. In some cases a decline was threatened into a semi-barbarism such as even pioneer days in this region had never known.

To this corner of his wide parish—he often travels forty miles of a Sunday—the Parson had brought us. Several persons were on hand, waiting for the building to be unlocked; and by the time services began, about twenty-five were present in addition to our party. The trim little interior was tastefully decorated with autumn leaves. Everybody looked as though coming to church was a pleasant event. The Parson's wife played the organ and sang a solo, and two of the Gilbert boys were in the choir-loft—George with cornet, Clossie with violin. Before his brief sermon, the Parson rendered a market report. He had been investigating potato prices in Middletown on behalf of his flock, and he told explicitly of condition. This, it seems, is one of his regular functions. The sermon was couched in terms that were calculated to reach the hearers. The Parson went no further afield than Middletown to get an analogy. His illustrations were drawn from the life with which these people were familiar. After the sermon, he discussed the award of a jackknife, given by himself for the best potato-field. The county agent of the Farm Bureau had adjudged two growers tied for the prize, and the Parson thought there would have to be two jackknives. Then we adjourned for dinner.

An interesting dinner it was, to be sure. The local women brought pies, cakes, and other things to add to what Mrs. Parson had provided. Under the Parson's direction, the original vestibule of the church, and the rear gallery immediately above it, had been enlarged. The remodeled vestibule was our dining-hall. After the dishes were washed the flying squadron retraced its way to Rockland, where an afternoon service was held in the building used for church and community house. Built one hundred and thirty-two years ago, as a Methodist chapel, it had been closed for forty years when the Parson reopened it. "Some folks think it's rather sacrilegious to have a meal or a dance here," he said, "but they evidently thought it was all right for the place to be neglected and forlorn and filthy."

At Rockland the congregation was a little smaller, but there was the same hearty singing; and the Parson gave another talk, quite different from that at Killingworth but equally clear and applicable to the lives of those who heard. After the service, an interval for "visiting" followed; then the Parson produced a roll of new oilcloth for the dining-table, and the ladies prepared supper. Twilight was deepening before we started home. There were stops at crossroads to put down some of the Rockland young folk; and it was after nine o'clock when we reached the Parson's house. That's the sort of day the Parson puts in. And Monday night he was to conduct a community social.

For he set going week-night socials and dances, Christmas celebrations and "Old Home" days. He advises with the farmers about their crops, with housewives about their homes. He gives stereopticon lectures and cuts hair. He trades in Middletown for the peoole and delivers the purchases. He has held mid-week prayer meeting in the fields, cleaning out the weeds from the crops of a poor widow. The Parson obtains seed and fertilizer for his parishioners. He distributes clothing, and takes folk to the hospital when they need that. He has faced misunderstanding, mean remarks, and petty dislike, and has even been brutally attacked by a gang of young roughs—for it is human nature not always to appreciate benefits. But he has persevered and won over his opponents.

Life Insurance Rate Juggling Costs Millions

Concluded from page 4

age thirty-five the premium on a ten-year policy of $1,000 is only $14.50, while on the ordinary life it is $28.11—practically double.

Nothing could be plainer, then, than that if the buyer of an ordinary life policy dies at any time before the tenth year, he has paid in twice as much as he would have paid had he taken out a ten-year term policy. Yet the company clearly could well have afforded to carry his insurance at the lower rate. The same rule applies in comparing the twenty-year term with the ordinary life policy, and we have seen that the experience of a prominent New York company shows, by its own admission, that the great majority of deaths on which claims have been paid have occurred within twenty years of the issuance of the policy.

Let us now examine briefly one of the most popular forms of policy, which is known as the Twenty Payment Life. Again we will assume that the policyholder is thirty-five years of age and has taken out $1,000 insurance. He pays what is called an ordinary premium of $38.36 a year. The ordinary premium is arrived at by the customary process of leveling the natural premium, so that the same amount is paid each year. This results, again, in there being an excess payment in the earlier years to care for the increased cost of carrying the insurance through the later years, and thus a reserve is built up. The first year's premium, and sometimes the first two, however, are applied to the cost of getting the business, and nothing credited to reserve.

The Twenty Payment Life policy will work out as follows:

Age	At Risk	Reserve, or Cash Value	Age	At Risk	Reserve, or Cash Value
35	$1,000.00	Nothing	45	713.76	286.24
36	955.28	$44.72	46	682.32	317.68
37	931.80	68.20	47	649.84	350.16
38	907.54	92.46	48	616.30	383.70
39	882.48	117.52	49	581.67	418.33
40	856.60	143.40	50	545.89	454.11
41	829.86	170.14	51	508.93	491.07
42	802.23	197.77	52	470.63	529.31
43	773.79	226.31	53	431.11	568.89
44	744.22	255.78	54	390.08	609.92

At the age of fifty-four, premium payments cease, and the policy continues in force, because there is now a reserve on deposit with the company which is equal to the single premium necessary to pay for $1,000 of insurance at that age. This $609.92—which is much less than the aggregate of payments with accrued interest—is the cash value of the policy after twenty years, and is in reality the premium which the policyholder now gives over to the company to carry the policy for the rest of his life.

The policyholder thinks, and is allowed to think, that he has $1,000 of insurance protection. The fact is, however, that the actual risk carried by the company is now only $390.08. In other words, the so-called "investment" feature of his policy, which no doubt was made an important selling point when he bought it, now becomes a joker, as in case of his death the next year the $609.92 reserve is applied to the payment made to his beneficiary, the company contributing only $390.08. If it is not an assessment, what is it?

Let us take two concrete examples. A and B, both aged thirty-five, take out $1,000 of life insurance apiece.

The Cases of A and B

A TAKES a twenty-year term policy, premium $16.24, while B takes a twenty-year life policy, premium $38.36. It is perfectly apparent that B is paying $22.12 a year more than A. Let us assume that both die after nineteen years. The beneficiary of A and the beneficiary of B both get exactly $1,000, yet B has paid $728.84 for his insurance, while A has paid only $308.56, which was all that the company was really entitled to for carrying the risk.

In other words, when calculating the number of persons in the group who will die within twenty years, it was found that an annual premium of $16.24 would be amply sufficient to take care of all death claims, pay all expenses, and give a profit to the company.

Could anything be plainer, then, than the fact that B has contributed to the insurance company an excess payment of $420.28 over and above the sum to which the company was entitled? Did this money rightfully belong to the widow and orphan? If so, why was it assessed against the amount of the policy?

In the previous article, it was stated that in the case of ordinary life insurance, one has to die to win the game. But in this article we shall show how, in the case of the combined endowment-life policies which the insurance companies have of late years been pushing on the public with special zeal, the company has stacked the cards so that *one doesn't win even by dying. It is a case of "heads I win, tails you lose."*

The so-called endowment policy is one of the cleverest schemes for extracting money from the public, without an equitable *quid pro quo,* that has ever been worked out.

The endowment policy professes to combine two entirely different financial transactions; that is, that of a savings account and that of insurance protection. As a matter of fact, they are really not combined, inasmuch as, if you die before receiving your endowment, the amount that you have laid aside for that purpose is cheekily converted into an assessment upon your widow or orphan, and applied upon the insurance which you had taken out for their protection.

The fact that the companies have been so eager to popularize this form of insurance is in itself a suspicious circumstance, since the commercial insurance companies are, as we have already pointed out, not in business for their health or for the public's benefit, but for their own profit. Quoting again: "A life insurance company is organized for the purpose of making money—first, last, and all the time."

The endowment policy makes a juicy melon for the company, but where, in popular parlance, does the insured "get off"? Let us see.

The secretary of an insurance company in "What Life Insurance Is and What It Does," explains the endowment policy with engaging frankness. We will let him tell us all about it:

"The endowment policy is a combination of two other contracts—the term policy and the pure endowment. A term policy for $1,000 can be issued to run for any desired period, such as ten years. If a person whose life is insured dies before the end of that period, the company must pay $1,000. If he is alive at the end of the period, the contract will expire, the insurance will end, *and the company will have nothing to pay.* (Our italics.)

"The pure endowment is the converse of the term policy. The contract runs for a given period of years. If the insured dies before the end of that period, *the company will have nothing to pay.* (Our italics.) If he is living when the period ends, the company must pay the amount of the endowment."

What could be more charmingly simple? On one policy you have to die to get the insurance, and on the other you have to live to get the endowment. The insurance company is eager to combine them both for you. What happens then? Why, you are led to believe that you get both kinds of insurance.

But the secretary's own words make it quite plain that you cannot possibly get more than one, unless you can perform the feat of dying and continuing to live at the same time.

Paying for Two, Getting One

THE annual premium on a term policy covering insurance protection of $1,000 for ten years is $14.50, as we have already seen. The annual premium for a ten-year pure endowment in the same amount is $93.20.

Bear in mind, that if you live beyond ten years the company pays no life insurance, while if you die within ten years it pays no endowment.

Yet the companies, out of the goodness of their hearts, are not only willing but anxious to sell you both policies combined in one, at a very slight discount from the cost of both separately.

"The company," the secretary goes on to say, "will combine them in one contract—the endowment policy—and charge at age thirty-five $105.87, which is a little less than it would charge for the two contracts issued separately."

A very little less, indeed, since the cost of the two separately, if there could be any conceivable reason for buying them, would be $107.70—only $2.00 more than the bargain counter price.

But the secretary of the company quoted is still more frankly explicit about what you are getting.

"If the man," he adds, "dies within ten years, the company will pay $1,000 under the term (life insurance contract), and the pure endowment will expire. If he outlives the period of ten years, the insurance expires, and the company pays $1,000 under the pure endowment."

Translated into plain English, this means that if the company pays the life insurance, it pockets your savings account; while if it pays back your savings, it cancels the life insurance.

The purchaser has paid for two things, but in the nature of the case, as the scheme is operated, he cannot possibly get more than one. The "savings account" idea is the big selling argument in unloading this form of policy on the public. The prospect was probably told by the agent that paying the premiums was like putting money in the bank, with insurance protection thrown in. But was it made plain to him that in case of his death the endowment would be turned into an assessment on his life insurance?

If, instead of swallowing this endowment-life policy, *you had taken out an ordinary term policy for $1,000 at $14.50 a year, and had put in the banks $93.20 a year for ten years, that would be the result?*

If you lived beyond ten years, your savings with interest would amount to more than $1,000, every penny of which would be yours. On the other hand, if you died within ten years, your widow and children would get the face value of your life insurance, $1,000, and your entire savings account in addition.

In so far as the endowment business is concerned, the insurance company is in reality doing a banking business, pure and simple, and when a banker appropriates to his own uses the funds of his depositors he risks a sojourn at Leavenworth or Atlanta. When the insurance company acts as a banker, should it be accorded any greater privileges?

In view of the facts which we have thus far made plain, it is difficult to understand the psychological processes of a financial writer in one of our leading newspapers who on January 10, 1923, wrote in his columns: "My advice to young men is to take out an endowment policy."

If we analyze the situation a little further, it becomes quite plain that everything paid in excess of $14.50 on the endowment-life policy we are considering, is an overpayment above the cost of the insurance protection, and this overpayment is entirely lost to the widow and orphan should death occur before the maturity of the contract. The same rule applies to all forms of endowment or investment insurance.

The reserve fund is earning money all the time at compound interest. The president of a certain insurance company, in his report to the stockholders, notes with much satisfaction the rapid growth of the "earnings." "Great as these earnings are at the present time," he says, "they are merely a drop in the bucket to what they will be a few years hence, for the reason that the reserve fund, as has already been observed, increases out of all proportion to the growth of the insurance in force and to the age of the company."

Let us quote briefly from a statement credited to Mr. Sheppard Homans, whom we have already referred to as the author of the American Mortality Table, and whom we may regard as the greatest American actuary:

"There is but one function for the institution of life insurance, and that is protection. There is but one form of contract issued by a legal reserve company that will give the insured a square deal. The companies are introducing a feature which, while it increases the cost of insurance, does not increase the protection. Therefore, the companies should be compelled to open a double-entry account with each policyholder. Then, in the event of the insured dying before the investment part of his contract became effective, the company would be compelled to return to the beneficiary, in addition to the face of the policy, that amount he had placed with the company for a purpose he had failed to live to realize."

There have been several attempts to correct this abuse through legislation. At the 1920 session of the Massachusetts legislature, a bill was introduced aiming at such a reform, and at the 1923 session of the Illinois legislature two bills were introduced along the same lines. But the insurance lobby is a powerful institution, and it is almost needless to say that the bills died in committee.

We have obtained a copy of one of the Illinois measures. It is ticketed as "Senate Bill No. 392, Fifty-third General Assembly, introduced by Mr. Webster, April 19, 1923, read by title, ordered printed, and referred to Committee on Insurance." The text follows:

"A Bill

"For an Act in relation to life insurance policies.

"Be it enacted by the People of the State of Illinois, represented in the General Assembly:

"Section 1. Every 'Endowment' policy or 'Limited Payment Life' policy hereafter issued by a life insurance company in this state, shall provide that any payments over and above the 'whole life' premium payments, together with three per cent interest thereon, shall be paid to the beneficiary in addition to the amount of insurance named in the policy, if the insured dies before the maturity of the 'Endowment' policy or before the end of the year in which the 'Limited Payment Life' premiums are completed.

"Section 2. Such policy shall also provide that the amount of such payments over and above 'whole life' premium payments on 'Endowment' and 'Limited Payment Life' policies shall be loaned to the insured at any time on request, and such loan shall not affect the insurance named in the policy, should death occur, as stated in Section 1."

It took a long and hard struggle to compel the insurance companies by law to grant loan and surrender values on any life insurance policies, and perhaps another such battle will be necessary to make them play the game square in connection with these newfangled 'endowment' policies.

Since, in the case of the mutual companies, it is the policyholders who legally constitute the company, the question might well be asked, why do not the policyholders assert their rights for the protection of their interests?

Professor Huebner, of the University of Pennsylvania, in his recent textbook on insurance, says:

"In practically all cases the companies are controlled by a limited number of persons, who have little or no difficulty in securing the necessary proxies to perpetuate their control."

Policyholder Is Bound

EVEN stronger is the language of United States Report No. 1539, page 147:

"All of which demonstrates that so-called control of life insurance companies by the policyholders through mutualization IS A FARCE, and that its only result is to keep in office a self-constituted, self-perpetuating management which can usually rely on the Agency force to more than offset a policyholders' uprising if such a thing is conceivable."

And, although the individual policyholder's rights have been made a farce, he is bound hand and foot by iron-clad duties and obligations, as shown by the following excerpt from the charters of some of the largest mutuals:

"Every person, who shall become a member of this corporation by effecting insurance therein, shall the first time he effects insurance, and before he receives his policy, pay the rates that shall be fixed upon and determined by the trustees, and no premium so paid shall ever be withdrawn from said company, except as hereinafter provided, but shall be liable to all the losses and the expenses incurred by this company during the continuance of its charter."

The disinclination of the companies to accede to the demand for thorough reform may be in part due to the fact that it will involve a lot of difficult explaining to the thousands of policyholders who have already been "sold" on these so-called endowment policies and are now paying their hard-earned money for what it is difficult to refrain from designating as insurance "gold bricks."

It is such methods of doing business that help to explain how it happened that in 1922 the insurance companies' excess of income over payments to policyholders amounted to more than one billion dollars.

But the insurance companies, if they value public opinion, will not wisely risk another legal investigation such as that of the Armstrong Committee. It will be better for themselves in the long run if they will clean house of their own accord, make an honest effort to give the policyholder a square deal, and put an end to all practices for getting business that are not on the level, even if it involves the restitution of millions of dollars already unfairly taken from the slender resources of widows and orphans by means of such schemes as the combined endowment-life policy, and camouflaged assessments of unused reserves upon death claims on policies of every description.

Actually Carries Out His Platform Pledges

California's "Budget Governor" Cuts $20,000,000 From State's Expenses for Two Years

CALIFORNIA is going through the second great surprise of her nearly seventy-five years of statehood. The first was the election in November, 1922, of an almost unknown man—in fact, quite unknown politically—to the governorship. The second is the fact, just realized by the three and one-half million inhabitants of the state, that this governor has saved for them rather more than $20,000,000 in maintaining their state and operating its machinery of government for the biennial period for which appropriations are made.

The election was a complete upset of all the political "dope" in California, for by it Friend William Richardson, who had been successively state printer and state treasurer, defeated the incumbent, William Stephens, who had been the friend and ally of Hiram Johnson, United States Senator, and, supposedly, carried with him the support of the latter. To the casual eye, the election of Richardson was due to his platform of economy; but as a matter of fact, now that the cards are all on the table, it was due more than anything else to the almost undivided support of the newspapers in towns of 25,000 and less throughout the state. The large cities voted against Richardson; but the smaller cities and towns and the country came into their own with his election. Possibly there never has been in California an election in which the voice of the actual, numerical majority of the people was heard with such force as in the gubernatorial contest of 1922.

Meanwhile, in the background, seldom mentioned by its friends because of the fear that too much publicity would draw down upon it destructive wrath in the legislature and at the polls, lay the budget bill, the fruit of the investigations, studies and state-wide activities of the 4,000-odd members of the Commonwealth Club, of San Francisco. This club is divided into innumerable sections, each of which is persistently studying some subject on which the voters should be informed. From its work have grown several valuable improvements in the laws of California, and still more valuable improvements in the methods of operation of state, county and city government there. The result of this particular investigation into the costs of operation of the state government was an amendment to the state constitution, providing that all the departments of the state must submit estimates in detail of their financial requirements for the biennial period. The governor, having received these budgets, was empowered by the same amendment to cut down or eliminate any item or items he chose, and to make any and all changes in the departmental budgets that he might see fit to make. The only manner in which the governor's decisions could be overridden was by two-thirds vote of the state legislature.

This amendment was put on the same ballot with the names of Friend W. Richardson and William Stephens as the leading candidates for governor. The budget amendment was sandwiched in among a score or more of other amendments, and alterations to the law, and the same quiet, almost unsuspected vote which sent Richardson to Sacramento, also made this amendment a part of the organic law of the state. This virtually bolted the economy platform, on which Richardson stood, into the deck of the California ship of state. Its results have been tremendous; indeed, it is doubtful if a state election in a decade has been more important to the people than this suddenly-arisen wave of business in government is to the people of California.

Safe in the fact that the opposition in the legislature could not obtain the necessary two-thirds vote to nullify his work of economy, Governor Richardson took his first step in reducing the coal bill of ship of state by appointing Mrs. Nellie Brewer Pierce a member of the state board of control, which has charge of all the paying out of state funds. To make the work more sure, he named Mrs. Pierce specifically to be in charge of appropriations, accounts and budgets. Mrs. Pierce had played politics in New Mexico, had been a newspaper worker and an expert accountant in California, as well as an interested participant in county, municipal and state politics there. She was acquainted with the use of money in the maintenance of a state, and with the involutions of politics and the misuse of that money. Then these two, the governor and the first woman ever to have so much financial power in a state, sat down to trim the sails and get more power out of the golden coal the people were shoveling, in the form of taxes, under the boilers of the before-mentioned ship.

It is doubtful if they asked advice. And this was the first shock to the political wiseacres, the professional advisers and the general governmental hangers-on. They had before them combined departmental budgets totalling $110,000,000 for the biennial period of 1923 to 1925. This was an increase of more than one hundred per cent over the appropriations made by the legislature in 1919, when $52,700,000 was the total, and an increase of approximately twenty per cent over the appropriations of 1921, which aggregated $91,400,000. It seemed to Governor Richardson, as it had seemed to the Commonwealth Club, that the people of California were paying too much for their government. The argument was raised that, with 100 000 or more persons coming into California every twelve months to reside permanently, an average cost of thirty-one dollars every two years for the per capita expenses of government was not excessive. Governor Richardson believed that, by the application of the same principles of simple business which he had employed as state printer and as state treasurer, this per capita average could be reduced—and he has reduced it, with the aid of Mrs. Pierce, to between twenty-five and twenty-six dollars. That is to say, the expenses of government in the state of California for this and next year were cut, at first, from $110,000,000 to $80,000,000. It was later found, however, that some of the necessary departmental work would be reduced almost to the vanishing point by this reduction, and the ultimate budget will be between $85,000,000 and $90,000 000, probably closer to the lower figure than to the higher.

The principal saving has been made in the elimination of political "deadwood," the straphangers of state government, who did little more than draw their pay. It is an axiom among economists that "nine men are required to do the work for a government that one man would do for a private corporation," and Governor Richardson apparently has reduced the nine to at most three. There is some hope that, ultimately, these three will be still further reduced to two, if a method can be found whereby every employe of the state can be induced to give even half a day's work for a day's pay. Even the governor, however, is not so optimistic as to hope that this can be accomplished in one biennial period. Among the eliminated were those who could not do the work assigned to them; those who could but would not; and those who devoted the most of their government-paid-for time to devising better methods for the operation of that government. This last class—better known to capitol reporters and others familiar with state governments in operation as "government welfare workers"—were sadly surprised when they were "given the air" by the new administration. "We can get along without the political welfare," said the governor, "if we can persuade the real workers to remain." This is something else again in government management, and it works.

Above, left—The Governor of California, and two of his "right hand men": left, Joseph Vickers, private secretary to the state executive; center, Governor Friend William Richardson; right, Harvey M. Toy, head of the new state highway commission, which, under the Richardson administration, has adopted the plan of building more permanent roads where they are most needed, and refusing to pay political debts by constructing costly paved highways in sparsely populated counties. Circle—The capital of California, to which Governor Richardson was sent on a platform of economy, with the new budget system as his pruning shears. From his office there he has succeeded in reducing the costs of operation of the state by approximately $20,000,000, though he went into office less than a year ago.

GOVERNOR FRIEND WILLIAM RICHARDSON,

At his desk in the state capitol of California, at Sacramento. He believes the state should get what it pays for, and that the business of the people should be run on the same principles as a private industry.

By HARRY H. DUNN

As soon as the budget was announced, the politicians realized that the amendment by which this power was put into the hands of the Quaker editor who became governor, they raised a howl which echoed back from the blue sky of California more loudly than the siren song of a Los Angeles oil stock promoter. The politicians realized that they had helped to carry a box of dynamite to the polls, and that the legislature was in no position to suppress the explosion. Never in the history of California has there been such a migration of politicians, legpullers, yes-men, old-friends, and "influential citizens" as went to Sacramento in the spring of 1923. The gold rush of 1849 was a freshman brawl in a correspondence school compared to it. But, in the language of a former political knight of the underworld in San Francisco, "it didn't git nobody nowhere." The "Budget Governor" and the "Lady of the Budget" could and did say "No" in more ways than Solomon could say "Yes" to his wives. "I know now why 'No.' means 'number,' " said one young San Francisco reporter to the writer; "it's from the times Richardson can say it."

Governor Richardson recently announced that, following the establishment and enforcement of the state budget, thirty-six counties taking hold upon the same idea, had either reduced their tax rate, refused to increase it, or had made such slight increases as to be inconsiderable in comparison with the increases of recent years.

"The state, of course, has no control over county tax rates, yet the economy campaign has resulted in stopping the orgy of extravagance," said the governor, "and has been felt in the smaller political subdivisions. I propose to keep up this fight to protect the taxpayers, regardless of the opposition of legislative squanderers, reactionary spendthrifts, the old and discredited political machine, and the taxeaters whose jobs have been abolished."

Governor Richardson's path has not been smooth. The politicians, the "outs," the political machines, the bosses of San Francisco, and the hundreds who have been accustomed to feed free and full at the political pie platter have attacked him and his administration, tooth and nail. His immediate subordinate in office, the lieutenant-governor, who held the same office under the preceding administration, has been a leader in this opposition, and one of the Hearst newspapers in San Francisco is the mouthpiece of the enemies of economy in state operation. Wild demands for the governor's recall, even hints at impeachment proceedings, have been voiced, but the "little fat editor" has gone quietly along, saving the state more money for each year of the term than would pay his salary for one thousand years.

Savannah, Founded as a Refuge of Debtors

Today City Is Largest Naval Stores Port and Second Largest Cotton Port

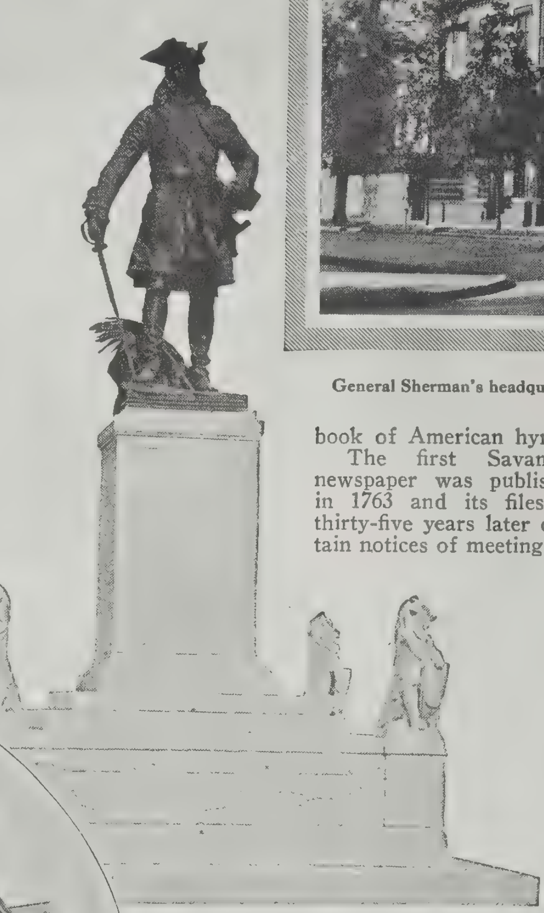
By GEORGE H. DACY

WHEN General James E. Oglethorpe founded the colony of Georgia and the city of Savannah February 1, 1733, his primary purpose was to establish a refuge in the New World for English debtors who could start all over again and atone for former shortcomings and crimes by carving out creditable futures and meritorious achievements in the American wilderness. In those days, in the eyes of English judgment and justice, to owe money was a heinous offense indeed. A man could be hanged for any one of 135 crimes and English magistrates were so severe that men who could not pay their bills exerted every effort to escape from the country before they were caught and convicted. General Oglethorpe obtained the royal consent to establish a community where the debtors could work out their salvation.

General Oglethorpe had twenty eminent associates and English philanthropists who assisted him in his project after George II of England endorsed it by granting a charter. With 130 debtors who had been freed from chains, Oglethorpe sailed for South Carolina, reaching Charleston after a voyage of fifty-five days. Leaving his companions at Charleston, where they were received with kindness by the colonists, General Oglethorpe, aided by William Bull, a civil engineer, scouted along the coast of Georgia searching for a suitable site to establish a new colony. Oglethorpe and Bull visited a Yamacraw Indian village near the mouth of the Savannah River. Where the wigwams of those Indians—a branch of the Creek nation—then stood is today the beautiful city of Savannah.

The Indians favored the English invasion. As a result of the counsel and diplomacy of Tomo-chi-chi, one of their chieftains—afterward he became a great friend of General Oglethorpe—the Yamacraws agreed to give the white men a large tract of land in the neighborhood of the Savannah River. In appreciation, Oglethorpe gave the new settlement the name Savannah. Shortly after, he brought his colonists to their new home. At first, the settlers lived in crude wigwams made of boughs from evergreen and pine. Oglethorpe, with Bull, the engineer, began to lay out the city. They planned on paper, and, excepting Washington, Savannah is the only city in the United States built according to a definite scheme. All streets, parks, plazas and building sites were staked off before a single hammer or saw engaged in the construction of a building.

General Sherman's headquarters during his sojourn in Savannah as an uninvited guest of the Confederacy.



Statue of James Oglethorpe, founder of the colony of Georgia, in the city of Savannah.

Christ Church, the oldest place of religious worship in Georgia, the ground for which was set aside in 1733.

Savannah is a city of magnificent distances, broad avenues and fine plantings. Oglethorpe had a friend, Costell, a clever architect, who had written several books about his profession. Costell was a genius in architecture and a failure in finances. He landed in the debtors' gaol where, in time, he died. Oglethorpe, it is related, incorporated many of Costell's ideas in Savannah.

Within a year, there were ninety-one buildings. The town was laid out in 240 freeholds of twenty-four square miles area. Forty houses constituted a ward, to which four square miles of adjacent country land belonged. The English trustees and promoters had decided that it should specialize in producing oil, wine and silk, and despite the lack of interest of the former debtors in these commodities, they were foisted upon them and it was not until much money and time had been wasted in mulberry trees, grapevines and silkworms that the backers of the project abandoned their ideas. About that time, they were responsible for sending the Rev. George Whiteside to the colony as minister. In 1740, he established the Bethesda Orphanage at Savannah, the oldest institution of its kind in the country. After him came John Wesley, another divine, who organized the first Sunday school in history. The Wesley Sunday School class still holds regular meetings in Savannah. Wesley wrote and published the first book of American hymns.

The first Savannah newspaper was published in 1763 and its files of thirty-five years later contain notices of meetings of the Savannah Golf Club. The players of those days made liberal use of the nineteenth hole, if the printed work is creditable evidence, and social gatherings were frequently celebrated.

Bethesda Orphanage, the oldest of its kind in America, established by Reverend George Whiteside in 1740.

The parkways alone are worth a trip to the city. As monuments to the architectural ability of Governor Oglethorpe they are more impressive than the loftiest statue. Twenty-four municipal parks, at intervals of two blocks, are spread along the leading boulevard of Savannah—it is named after William Bull, the engineer who helped Oglethorpe design the city—to beautify the southern port with the oak and palmetto which shade the attractive streets. In early days, the circular parks at the end of every second block were used as market places and as stations of rendezvous when a call to arms was sounded. Savannah, belle among Dixie municipalities, has more well-kept parks, it is asserted, than any city in the world.

Savannah is the first port to assemble a steamship and send it across the Atlantic Ocean. The vessel was the *Savannah*, a boat which a Confederate naval officer blew up when General Sherman called on Savannah. The principal parts of the boat were built in New York and New Jersey, but she was put together in Savannah and capital from that city paid for her construction. It took the ship more than three weeks to negotiate the first voyage in 1819 from Savannah to Liverpool.

The principal parkways of Savannah are replete with imposing statues, marble and bronze chroniclers of bravery and dauntless heroism. Dignified memorials and tributes to Governor Oglethorpe, General Nathaniel Greene, Sergeant Jasper—a soldier who under a withering fire from British guns rescued the American flag when it was shot from the fortifications—Tomo-chi-chi, the famous Indian, and Count Pulaski, the Polish nobleman who was killed at Savannah fighting for American independence, adorn the formal circles and public gardens.

Christ Church, the oldest religious edifice in Georgia, the lot for which was selected in 1733, being the spot where the first religious services of the Oglethorpe colony were held, was built in 1740. Since that time, the church has been burned, razed by storm and torn down three times, and now consists of an imposing permanent building eighty-five years old. The United States Custom House stands on the spot where John Wesley, almost two centuries ago, preached his first sermon in America. An unusual marble seat now marks the place where General Oglethorpe pitched his camp the first night he spent at the Yamacraw Indian village which now is Savannah. There are armories enough in Savannah to provide martial spirit and well-trained troops for a place many times its size. The city maintains one of the three regiments of field artillery in the entire country and has a half-dozen fine armories and drill halls. The municipal fathers have even provided a series of dummy forts where sham battles and military maneuvers may be practiced. The Chatham County Artillery, the Georgia Hussars, the Savannah Volunteer Guards and "Savannah's Own" have long been prominent in national guard affairs. In national guard activities, Savannah leads the entire South.

The Savannah Theater is the second oldest playhouse of its character in the country. It was built in 1818. At one time the famous Joseph Jefferson was its manager. This ancient home of drama and music looks almost like Rip Van Winkle as compared with the modern municipal auditorium which seats 4,500 spectators. Although Savannah is one of the smaller Southern communities, it is the home of the largest bank south of Philadelphia, a financial institution with deposits aggregating more than $70,000,000. In passing it is worthy of note that Savannah has never had a single bank failure.

The city is the largest naval stores port in the world, and in normal times is second only to New York City on the Atlantic Coast in the value of exports. It is the second largest cotton port, handling in excess of 2,000,000 bales annually. This city of extensive shipping dominates the Sea Island cotton market and also handles many million feet of lumber each year. Savannah has a remarkably fine landlocked harbor five miles along the city's front with a channel thirty-two feet deep. Uncle Sam has appropriated $1,000,000 to deepen the Savannah River twenty miles from the mouth. Custom house records show that Savannah as a port did $4,000,000 more business last year than the year before. The port is now equipped to handle simultaneously 125 ships covering 27,873 feet. The maritime storage space now covers an area of 20,700,000 square feet.

There is a big move to develop the city as the state port of Georgia, just as Mobile serves Alabama and New Orleans aids Louisiana. The project would feature the centralization of Georgia's marketable and perishable produce of all sorts at Savannah where a mammoth chain of storages, elevators and similar equipment would be operated by the state. Estimates are that these buildings and their appurtenances would cost more than $12,000,000. Storage to handle the surplus farm produce of Georgia and market it as demanded would expand and promote agriculture and intensify production. Every branch of farming would react. It would solve Georgia's perplexing marketing riddles which have checked profitable selling.

Savannah is admirably located for state port purposes. The city has superior water transportation to northern markets and her railroad facilities are good. With Savannah fortified as a state port, Georgia produce would not fear any competition. The state port means cheap transportation, careful handling, safe storage, marketing when prices are favorable and shipping when tonnage is available. With such facilities, the farmers no longer need worry about over-production or forced selling. Farmers and industry alike support the state port enterprise. The project is before the Georgia legislature for consideration. The plan is to obtain a popular vote on the proposal at the 1924 election.

A magnificent boulevard of seventeen miles is being placed which will link Savannah with the sea. Part of this paved pathway is called Victory Drive and is a memorial to Georgian soldiers who were killed in the World War. The road leads to Tybee Beach, the Atlantic City of Georgia, and represents an engineering feat of no mean proportions, linking as it does a group of little islands.

Not far up the river is Mulberry Grove, formerly the estate of the lieutenant-governor when the city was under the domain of England. After the Revolutionary War, Uncle Sam presented the estate to General Nathaniel Greene. General Greene died on the place and was buried there. Subsequently, his widow employed Eli Whitney as a tutor for her children. One day she suggested jokingly to Whitney that he devise some mechanical means of separating the seed from cotton. In 1793, the ambitious inventor perfected his first cotton gin which would do as much work in five hours as the average Negro could accomplish in five years working by hand. This invention was unquestionably the greatest contribution to the industrial South made up to that time. Even today it ranks as one of the leading half-dozen inventions of American history.

Strangely, after the death of General Greene, none knew exactly where he was buried until a century later, and then a vault at Mulberry Grove was opened and the inscribed coffin of the prominent Revolutionary leader was found. The remains were then removed to the base of a memorial in Savannah presented in honor of General Greene by Rhode Island. General Greene was originally buried close to the grave of "Light Horse" Harry Lee, father of General Robert E. Lee and a romantic figure of the pre-Civil War days in Dixie.

Savannah has experienced many reverses and vicissitudes. Several times the city was reduced to ruins by fires. Once its capture by the Spaniards was prevented only by the opportune intervention of the Yamacraw and Creek Indians. During the Revolution, Savannah for a time was controlled by the Americans. Finally, however, the British recaptured the city, about the time that Fort Wayne was established as the chief defense of the port. The following year, the French and Americans, aided by some Indians, tried unsuccessfully to retake Savannah. The city remained in Tory and British hands until 1782, when they evacuated the place for all time to come.

Fort Screven, one of the United States' greatest seacoast defenses, was the scene of the first capture of a British vessel by an American man-of-war. The American ship was a remodeled Georgian schooner. She defeated the Britisher off Tybee Beach and captured 16,000 pounds of gunpowder. Five thousand pounds of this powder was sent to the Boston patriots and subsequently used against the British at Bunker Hill.

Bonaventure, one of the finest cemeteries in the world, as well as the "Hermitage" and the Savannah terrapin farm, are curiosities that every visitor tries to see. With its spreading, towering oaks, netted with streamers of gray moss, it is a place of ghostly mystery. The "Hermitage" takes one back to slavery days; it is a typical plantation with many huts and cabins that one time housed the black servants. Early in the nineteenth century, Henry McAlpin, an architect, purchased the plantation on which he built unusually fine buildings.

He established a small brick yard in which was made the brick used to construct the mansion.

Above—Bull street in Savannah was named after William Bull, the engineer who aided General Oglethorpe in laying out the city. Below—Savannah is the second cotton port and handles more than 2,000,000 bales annually.

The Senator From Texas

Concluded from page 2

state supreme court upheld the Appellate Court's reversal of the original verdict.

Mayfield's name was thereupon ordered printed on the official ballot. At the same time the attorney-general of Texas ruled that Peddy's name could not go on the ballot, on the ground that the Republican party had not nominated him in a primary as required by law, and therefore could not claim him as its regular candidate. A million ballots were then hurriedly printed, carrying Mayfield's name and omitting Peddy's.

Texas is overwhelmingly Democratic; nomination of a candidate in a Democratic primary is equivalent to his election. The anti-Klan element continued their vigorous campaign to the end, under the direction of Colonel Henry D. Lindsley, first national commander of the American Legion. Two Houston men, John H. Kirby and J. S. Cullinan, financed the campaign out of their own pockets, to the extent of $60,000. These efforts, however, failed to overcome the normal November lethargy of the electorate, and Mayfield defeated Peddy by 135,000 votes out of 395,000 votes polled, with both parties participating; whereas 625,000 had been polled in the July primary with only the Democratic party participating.

The small vote polled in the November election of 1922 is stressed significantly in the contest subsequently filed against the seating of Senator Mayfield, and now before the Senate. Peddy, the defeated candidate, asks for a recount and recanvassing of the returns. His contest is divided into two sections; illegal voting, intimidation and false counting; and dominance of the Ku Klux Klan in Texas politics. Peddy's accusations may be examined briefly.

It is alleged that the records on which the result of the election was declared are incorrect, fraudulent in some instances, and illegal in many others; that printing Mayfield's name on the ballot was illegal, this number of votes exceeding 200,000; that 45,000 votes legally cast for Peddy were recorded as having been cast for Mayfield, and that 20,000 Peddy votes were not even counted. The petition alleges a conspiracy in many precincts not to count Peddy votes written in the Democratic column, calling by name twenty-seven counties and accounting for 4,799 votes which he says were polled for him but not counted. Sweeping accusations of intimidation are made, involving election judges and clerks, county officials, and members of the Democratic state committee of Texas, most of whom, it is alleged, "are members of the Ku Klux Klan."

The accusation of Klan dominance, which may or may not be considered by the Senate at all, recites a conspiracy by the Klan in "capturing control of the entire machinery and agencies of the Democratic party in Texas"; that both primaries and the election "were controlled by criminal conspirators." As to Senator Mayfield, it is alleged that he, as a Klansman, is pledged to exercise the functions of his office for the benefit of the Klan; that the Klan selected Mayfield as its candidate and concealed his membership from the public, and "through exercise of a military discipline, fear, terrorism and threats" forced the membership generally to support Mayfield; and that "through masked parades, meetings in force, threatening circulars and posters, whisperings and marchings or ridings of armed men, many thousands of voters were intimidated." Concluding the Klan section, it is set up that the organization has no legal right to do business or carry on its activities in Texas, never having received a permit.

Senator Mayfield meanwhile enjoys the rights and prerogatives of his high office to which, he says briefly in answer to the hullabaloo raised about him, "the people of Texas elected me, and that's all there is to it." Since the fourth of March, 1923, he has been the junior Senator from Texas. Whether he is to stay there is a question which seems to be interesting the country at large as greatly as it is interesting Texas, because of the new, and, possibly, precedent-making points involved in the attack upon him.

Boys Who Played at Journalism

Concluded from page 6

Among inventors are Frederick E. Ives, inventor of photo-engraving, and last but not least, Thomas A. Edison, who loves to revert to the time when he printed his little paper, the *Grand Trunk Herald*, at Port Huron, Michigan, way back in 1859.

To these names might be added many more. It is doubtful indeed if any single youthful pursuit or any single university can boast of so many distinguished alumni.

Some years ago the men whose names have been mentioned here organized an association to keep alive the memories of their activities in boyhood journalism. It grew rapidly and now numbers more than two hundred and is growing. They meet annually to exchange reminiscences and renew old friendships. They publish a little paper three or four times a year and they have a headquarters in New York where they maintain a library which houses the collection of those precious years when life spread out before these youthful and ambitious spirits. Here are many thousands of papers bound in hundreds of volumes printed from 1860 to 1890, and thousands of tintypes and photographs of the boys and girls. And here are convention-photos and many scrapbooks with professional newspaper notices of meetings in many cities—all comprising a complete record of a closed chapter in the history of American youth.

Baseball and the "movies," the influx of foreign immigration, the loss of the mechanical and artisan instinct which led the boys of the seventies to the industry of press and manipulation of types—these, or something else, be it what it may, have resulted in the almost complete disappearance of what a once distinguished American statesman, Speaker Randall, of the House of Representatives, was reported to have termed, "the noblest work engaged in by the American youth."

The boys of today have much that was denied to the youth of amateur journalism, but in contemplation of its past, of all the joys experienced by the boys who published, edited or contributed to these little journals, some of them not so little, either, who felt the pleasurable literary instinct, the thrills that came to every boy and girl who saw before him the paper that was the child of his brain and hand, who were able to mimic on a grand scale the political activities of their elders—who shall say that what the modern youth has gained is comparable to what he has lost?

An error in "Briefly Told" of January 19 made Mrs. Warren G. Harding's annual pension $50,000. This should have read "$5,000."

A bill compelling the use of steel passenger cars by railroads in interstate commerce was introduced in the Senate by Senator Harris, of Georgia. Senator Harris also introduced a bill to prohibit the use of wooden cars in front, or between steel cars in passenger trains.

Five million dollars is wasted annually in steam used in whistling on American railways, according to experts, who advocate the reduction in size of all locomotive whistles, the heightening of their tone to a shrill squeak and placing them in front of the locomotive.

Grade crossings are unknown in Great Britain.

When an American ship goes to sea to carry provisions to a vessel of foreign rating, engaged in rum running, the American vessel is subject to seizure and confiscation.

There is an annual waste of 140,000,000 feet of lumber in the United States because of the public's insistence on buying lumber cut in even lengths.

The mild weather of the last month has brought to life near Montreal, Canada, millions of insects that prey on fruit trees. Ordinarily these insects pass the winter in a dormant state.

"That the Negro needs and is determined to have schools, good wages, justice, and all those many and complex things that go to make up life in civilized America, we know. And further we know that he is migrating to the North that he may find these things which he failed to find in the South."—*Howard Snyder.*

Every third summer any teacher of Tulsa, Oklahoma, who spends the vacation time in travel is paid full salary at the same rate a month as in the regular school term.

The Czech language is the state language of Czecho-Slovakia and is taught in all secondary schools and all training colleges for teachers throughout the republic.

"Bayer 205," the German cure for sleeping sickness, is expected to result in the repopulation of the vast area stretching from the Southern Sudan in the upper waters of the Nile down to Lake Bangweolo in Northern Rhodesia. The name 205 means that 204 unsuccessful compounds were manufactured and experimented with during the ten years before success was won.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Six per cent of the population of Paris are living in insanitary homes. More than 4,000 buildings must be torn down to decrease the capital's tuberculosis rate.

The dissipation of every ton of coal divided into component parts has been figured by the director of the United States Geological Survey as follows: At the outset 600 pounds are lost in mining. Once the remaining 1,400 pounds comes to the surface, it takes 126 pounds to get the coal from the mine to the boiler room. There 446 pounds float up the smokestack in waste gases. 51 pounds escape in radiation and another 51 in the ash pit. The amount lost converting heat energy into mechanical energy is 650 pounds, leaving the remaining 76 pounds really to accomplish something productive.

Of the original Teutonic stock in Germany, the men of the time of Schiller and Goethe, only one-tenth remain. Nine-tenths of the population of Germany is of Slavic or Alpine stock

"Quit binding the Bible in black," says Dr. Charles M. Sheldon, author of "In His Steps." He is setting an example in a compilation of what he regards the essential parts of the Bible, now being published in the East, on which he has asked the publishers to use an attractive binding. The book is compiled from the American revised version, and represents work in spare evenings for the past twenty years.

In using honey as an anti-freeze mixture in automobile radiators, it should be mixed with water, half and half. Engine head gaskets and hose connections should be tightened up before using the solution as the honey-water will pass through apparently tight connections, causing stickiness. The solution becomes more efficient with evaporation from steaming, whereas an alcohol solution loses strength. A dollar and a half's worth of dark honey, unfit for table use, should last all winter.

At the foot of a glacier in the Montana Rockies, arctic flowers and specimens of the evergreens which correspond to the last trees of the North are found in abundance, having followed the retreating ice sheets thousands of years ago.

More than 1,000 acres of cotton was grown in Illinois during 1923.

Blazing Tamiami Trail Across Florida

CHRONICLER OF THE NEGLECTED TRUTH

No Crowd Without Team, No Team Without Cash

Players Paid in College Football and Scandal Is Declared Near

Never in the history of American university athletics has a football season produced more interest and greater crowds than has the season just finished. The successful college elevens have drawn crowds numbering at times nearly one hundred thousand, and tens of thousands have been turned away from the same contests.

The "gate" has been immense; never has football proved so profitable. But there must be players for these teams and it is the practice of paying for the material to turn out the crack teams that is taken up in this illuminating article by a writer who has witnessed the most important football contests of the past twenty years.

The writer is an authority on the game and is exact in every statement made herein. It is his hope that this discussion will make it unnecessary for him to take up in more detail the facts that are known to exist at some of the leading schools of the country.

By A Veteran Sports Writer

EACH year there is the usual agitation against professional football. Each year there comes the warning, also, against the professional taint in college football. Frequently there are veiled charges against this team or that one, against one or more players, here or there.

One day last season, one of the leading football coaches in the Mid-West bitterly denounced the professional football player and blamed the professional for much of the gossip pertaining to the amateurism of college players. The speech, as reprinted in leading newspapers, dropped the paid player to the lowest imaginable rank and the coach, like the famed Pharisee, offered thanks that he was not one of them.

Not many days after the coach delivered himself of this vitriolic attack, he received a letter from a man who had, during the previous season, been one of the stars of his varsity eleven but who was now associated with one of the professional teams that are so numerous in the mid-western states. In substance the letter read:

"Dear Coach:

"I read with a great deal of interest what you had to say about professional football players and the blot they form on the human race. You probably know that I am playing professional football this season and so I gather a personal meaning from your remarks. I am not denying that I am a professional and that I associate with other professionals but to add to your information on the subject I want to set down at least one of the observations I have made during my brief association with these social outcasts: I have still to find one of my brethren in crime scalping tickets to games. The money they receive, and for which you damn them, is for honest service, honestly rendered. After my experience with you and after reading what you have to say about professionals, I want to conclude by saying that I am proud to admit that I am one."

A peculiar phase of the professional aspect in college football is the finger of guilt that is pointed from all directions into all directions. No one is apparently guilty; it is always the other fellow. One day, not so long ago, the same coach, referred to above, said in an interview that all his team's opponents were more or less tainted and that the only simon-pure amateur eleven to his knowledge was his own. We have heard similar remarks from other coaches. They all appear to resemble the chap who found every man out of step but himself.

The professional taint is becoming a serious matter in college football and sooner or later the crash is certain to come. Competition is to blame; that and jealousy. Freshwater College builds a million-dollar stadium. This riles the graduate body of Saltwater College, its bitter rival. Saltwater College has never been outdone in anything by Freshwater College, has it? No, and it will not be outdone now. So dear old Saltwater College gathers funds from indignant graduates and builds a stadium costing a million and one-half dollars. This very thing has happened in every part of the country and is continuing.

When these costly sports theaters are completed a way must be found to get back part of the vast expenditure. The return must come at the gates. To pay for these colossal temples of sport they must be filled by a paying audience, not once but several times each season, and losing teams do not fill vast amphitheaters. It takes winning teams to pack in the crowds so winning teams must be secured. And, with competition as keen as it is, means must be found to secure a winner. It takes material and to secure the desired material often takes a great deal more than the educational advantages offered by the college. Yes, more often than not. It frequently takes $5,000 more.

What a Stadium Really Means

ONLY recently a publisher in the East was visited by the athletic director of his alma mater. The editor attended a college in a remote part of the East. The college has never had an enrollment of more than 1,500 and, situated away from the centers of population as it is, it has managed to get along with stands seating 5,000 at its football games. Incidentally, the stands were never filled except on home-coming day.

The athletic director came quickly to the point:

"We want you to subscribe to a stadium for the college. We have plans for a stadium seating 50,000 persons. It will be a beautiful structure, one of which every son of the old school may feel well proud. All the other boys are subscribing handsomely and I know we can expect a liberal donation from you."

To which the publisher replied:

"I am against your stadium idea. I don't like it. In the first place you do not need a stadium. I know what you are going to tell me; that so-and-so and so-and-so have stadiums and that we have to lift our heads as high as they lift theirs and that it is for the honor and glory of the old school and all that campus rah stuff. But I am trying to look beyond all the cheering of the moment; I am trying to see what you are not seeing. I am looking ahead to what will come after the stadium. You are going to build it on the money of the graduates and after it is finished the graduates will want to see a winning team. You won't have it. You feel you've got to make good. You do. You make good by going out and hiring boys that can play football.

"You are going to tell me that the old school has never done anything like that and won't. But that comes before. I am talking about what comes after. Can you explain to me how you are going to get worthy athletes to attend our college? What is there for them? In all frankness let us admit among ourselves that at least eighteen or twenty colleges offer just as good educational facilities. They do. Why should not that boy attend one of the others? They have advantages that we lack. They are, at least most of them, located near big cities where the boy can go on off days and enjoy himself. Boys like to do that regardless of the antipathy you and the faculty may have toward such amusement. And let me tell you that no boy is voluntarily going to come to our school and bury himself in the woods solely to play football for us. No. There are too many more attractive places where a boy of talent can play. You and I and the rest of us would never have gone to that college if we had not lived right close by and our fathers could not afford to send us to a more pretentious school. It was not by choice but by necessity that I attended and you and the rest attended. We had to go there or go to work. We did not like the idea of getting right down to work. So we went to college.

"It is about time that we talk frankly about this matter. There is not a chance of your filling any stadium with a seating capacity of 50,000. You know it. Then why build it? Just as a show place! Great! It must be an inspiring thought to hand the young and impulsive youths that are walking our campus today. More than half a million dollars sunk into a stadium. That is a glorious tribute to education.

"I am in a position where I can speak frankly. I played football at our college. I have followed football ever since. Every Saturday during the season finds me in the grand stand, if not back home then at some other school, for I love the game but I love it so much that I do not want to see it disgraced as you are planning to disgrace it. If that stadium is built I will be ashamed of its consequences. I will not care to admit to anyone that I graduated from that school."

"How Much Can We Offer?"

LAST winter a man who, in his senior year at a prominent university in the East, had won the reputation of being the greatest football player of the season, East or West, called on us.

"I just had a peculiar experience here in the city," he began. "I have been spending the last three weeks going from city to city, meeting high school football players and telling them of the educational advantages of our school. But I never got far with any of them. The first thing they would do would be to break in on my conversation and make a remark something like this, 'Mister, we have heard all that before. Get down to brass tacks! How much can you offer me?' And today I met two of the best high school players in your city and I started telling them about our school. I talked slowly, expecting the usual interruption. There was none. They let me finish. There was a pause. I added, 'Of course, you know boys that we pay no money. I can arrange for your tuition and probably I can get you your board, but I cannot definitely promise that.' And I nearly collapsed when the spokesman of the pair said, 'We won't play for money. We want to be strictly on the level and win the honors on merit. We want to be able to look everybody in the face. No one is going to pay us. We like your school and we're going there. We had decided to go there before you ever met us. And we are going to be genuine members of the team, paid by nobody, owing nobody any service.'

"I will give you my word that among more than 100 boys to whom I talked these two were the only ones that did not demand money. If I explained to any of the demands that we did not pay they would ask me how it came that we did not pay when the other schools paid. They certainly would be worth as much to our team as to any rival team. And then they would bid me a merry good day."

Attending one of the big games in a leading western city one day last autumn, we met the merchant prince of the city and he took us aside and asked confidentially why their team did not win its big games. We went into detail with him, explaining the technical flaws of the coaching system and why the style adopted for the team's play was unsuited. He heard us through, then rebuked us:

"Pardon me for saying that in my opinion you are wrong. It isn't the coaching or style of play but the close-fisted methods out at the university. They won't spend money for material and you know and I know that you can't get a winning team without material. When I want a man to sell goods in my store I go out and pay good money for the best man I can hire. I found out long ago that that means more profits. That is what the university ought to do.

"You heard of ——, of course. (Here the merchant named the outstanding player of the season.) Well, two years ago, he came to this town. He was here for two weeks. He wanted to enter the university. He certainly was the goods and they must have known it. He made proposition after proposition to them and what did they do for the time he was here? Turned 'em all down. Why, what they offered that boy was less than you would pay one of my clerks and if that boy isn't worth $50,000 a year at the gate I don't know of anybody that is.

"Well, that is how they do things at the university. Shortsighted and narrow-minded, a lot of classroom pinheads. They don't deserve to win and I wouldn't care if they never won if it didn't hurt business. Having a winning team here would give us a lot of good advertisement and the games would bring many people to town and to our stores who would not come otherwise."

A few hours later we met a prominent coach of a rival university. We related the incident to him. He laughed. "Say, that's nothing," he commented. "That player was in our town for more than two weeks and he made all kinds of propositions to us also and we couldn't do anything for him, so he finally shook the dust of our fair city off his shoes and went elsewhere to sell his services."

The peculiar thing about the entire proceedings is that the university which the player finally entered is one of the foremost in claims of purity and one of the first to point the finger of guilt at rivals.

It is an open secret that in one of the large cities of the country the magnificent stadium that adjoins the university located there was made possible by liberal contributions from the merchants of the city. In the inner circles of football this varsity team is generally referred to as the Board of Commerce Eleven. When the stadium was dedicated thousands of visitors flocked to the city and the merchants received a fortune from a liberal football-loving crowd. Also, there was much free publicity.

As the merchants viewed the affair their investment looked supremely sound and profitable and they were more than satisfied with the results. It seemed a stroke of business genius, that stadium idea. But the team lost the opening game and although that was two years ago the team has not won an important game since and attendance at the stadium has been reduced to a few thousand.

Happening into the city recently we asked a manufacturer how football was getting along and this conversation resulted:

"It's rotten. That team hasn't won a game in so long the town wouldn't believe it if it did win. The coach doesn't know a thing about coaching and hasn't any material. The team's got to get some material."

"How and where are they going to get it?"

"How? How do other schools get it? Why, go out and hire it as they do. They seem able to get the boys they want. Use the same methods. Every boy has his price; step in and outbid the other fellow. That's what I do in business and it looks to me as if the colleges are all following suit."

Checks All Made Out

A FOOTBALL official relates how, after a game, he went into the office of the athletic director to get his money. He found the director impatiently seated at his desk with a stack of filled checks before him. He fished out the check for the official who jokingly remarked, "Pay night, is it?" And the director replied, "Well, it won't be if those fellows don't hurry up here. I try to be decent and hand them their money each Saturday night and then they haven't the courtesy to come here as soon as they can after the game and get it. They keep me waiting. I've waited long enough. If they don't drop in within five minutes I'm going to leave and they can wait until Monday and it won't make any difference to me how much they holler."

Real money is paid at a number of institutions but as a rule the colleges and universities are a bit more subtle in their dealings with talented athletes.

At one of the big games last year the coach of the home university was at home in the evening chatting with a few intimate friends. They were disturbed by the arrival of a young man who quickly and nervously identified himself as being a senior student of the university that had, on the afternoon of the day referred to, furnished the opposing eleven.

"Coach," began the young man after identifying himself, "I want to get your assistance and influence working immediately. Fourteen of our boys are locked up in your jail."

"Football players?"

"No, students."

"What are they locked up for?"

"Scalping tickets. But they weren't scalping them for themselves. You see, each of the players is allotted a batch of tickets for the big games. The players, of course, can't sell them because they have to play, but they hand them over to picked students and the students

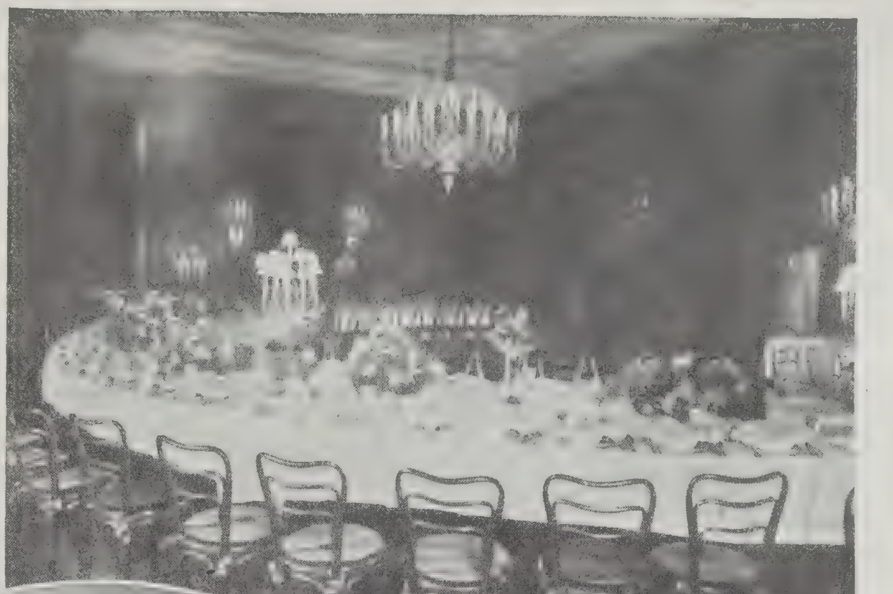
What It Means to Make a Home in White House

Expenses of Formal Function Heavy Money Drain—By MARY HAMILTON TALBOTT



The state dining room at the White House.

(C) Harris & Ewing

(C) Waldon Fawcett, Washington, D. C.

Above, left—Guest room, White House. In this room President Lincoln signed the Emancipation Proclamation. Above, right—White House kitchen. Below—The family library, started by Mrs. Fillmore, on second floor of White House.

WHAT does it mean to preside over the only household for which the nation is directly responsible, to make the only home in which the nation receives? What did the new mistress of the "President's House" find and what are the details of housekeeping which confronted her? These are things in which every housekeeper in the country is more or less interested.

To be but an occasional guest in the historic old mansion and then to find oneself overnight its mistress would bring a "thrill" to any woman. Mrs. Coolidge frankly admits that she likes the social life of the capital and is interested in the many-sided phases of her new home. Each new mistress becomes really acquainted with her new abode when she is piloted over it by the army officer in charge of buildings and grounds, at present Colonel C. O. Sherrill, for he it is who has the White House under his immediate care. On this tour of inspection they look into every nook and corner, turn out the contents of old closets and trunks and examine the household ledgers, just like any other housekeeper. Luckily, things have changed since Mrs. Fillmore's day, for a newspaper of her time says: "Mrs. Fillmore found the White House in a miserable condition, dirty and bare, with no corner that seemed like home. The great room over the Blue Room was covered with a straw carpet; underneath this was found a good Brussels carpet of the old pattern—a basket of roses upset. Mrs. Fillmore had this cleaned, sent to Buffalo for her piano, shut off much of the space with screens and with a good fire made the place seem very pleasant." Mrs. Coolidge found things spick and span, for now this home of the nation must never show a scratch or a worn spot.

Most women would look upon a "raise" in their husband's salary from $12,000 to $75,000 a year, with divers and sundry extras, as rather a golden plum dropped into the family purse, but the United States Treasury warrant for $6,250 which Uncle Sam monthly hands to the President, must cover so many expenses imposed by custom that it really is often hardly adequate. No matter how desirous Mrs. Coolidge might be to be a careful housewife, she must each year be hostess at eight or nine state dinners and receptions for which her husband must pay the bills, and these cost upward of $1,000 for each affair. The number of guests at the receptions invariably ranges from 2,500 to 3,000, all of whom must be served with salads, cakes, coffee and similar refreshments. These suppers are prepared in the White House kitchen with the assistance of extra servants. At the state dinners which are given to the diplomats of all foreign countries, the leading American officials and jurists are as a rule attended by from fifty to ninety guests. As there are nine or ten courses the cost of these about equals that of the receptions. Thus, for this single feature of state affairs, in one season the President must pay out eight or nine thousand dollars, and it must be remembered that this does not include the countless other formal and informal social affairs which by an inviolable unwritten law must be given each social season at the Executive Mansion—if there are no extraordinary reasons which prevent.

The cost of daily provisions must be met from the family purse, and this is a pretty big item. It is very rare that the family sits down *en famille* to a meal. There are seldom fewer than thirty persons, including the family, guests and a staff of servants, of which there are twenty to twenty-two. The wages of the servants, ranging from forty to one hundred dollars a month, are to a certain number paid for from Congressional appropriations, but every mistress of the White House has found this corps insufficient and from six to eight are paid for from the President's pocket. There are a few old official servants who remain in the house from one administration to the other, keeping in operation an uninterrupted household, but the rest usually change with the change of mistress. It was during the Roosevelt Administration that Congress deemed it fitting that the ranks of the servants be augmented by a chef. Prior to this time only a steward was provided by Uncle Sam. If the First Lady felt it necessary to have one, she had to pay for it. During the Harrison and Cleveland administrations the head of the kitchen was a colored mammy. Since Mrs. Taft's time a housekeeper has relieved the mistresses who have come and gone in that time from the petty cares which try the soul of most housewives, buying all the food and looking after the kitchen servants and housemaids.

(C) Waldon Fawcett, Washington, D. C.

One of the private stairways leading to the private apartments at the White House.

When Mrs. Coolidge wants a cozy corner built, a chair or sofa recovered, new hangings made, a wall papered, or anything else changed in her home, and she has absolute power to do as she chooses with her new quarters, she does not send for a cabinetmaker, upholsterer or paper hanger, nor does she sit down with pad and pencil and calculate the cost. Uncle Sam at the last session of Congress appropriated $50,000, which among other things provided that it was for "ordinary care, repair and refurnishing of the Executive Mansion" and $20,000 for "extraordinary repairs and furnishing of the Executive Mansion." so Mrs. Coolidge will only need to signify her wishes and Uncle Sam will put his O. K. on the bills, provided they do not exceed the amount allocated for this purpose. Out of the latter sum the East Room has recently been provided with a new hardwood floor and the heating arrangements of the house have been amplified.

Refurnishing and repairing was not always such an easy matter, for Uncle Sam is more generous with the "First Ladies" than he used to be. Before the Roosevelt régime, when the enlargement of the Executive Mansion and a corresponding increase in the housekeeping allowance made things easier for the mistresses, if a soap dish or tooth mug was broken Uncle Sam carefully replaced it with one as nearly matching as it was possible to secure. As may be imagined there was a hodgepodge of bedroom china. And to repaper a room and refurnish to suit the tastes of each new mistress was unheard of. He set the house in order, cleaned the carpets, tacked down the worn matting, and if the hangings were faded, turned them; further than that, the mistress had to pay for anything which she wished changed or renovated.

Even now, however, no mistress or maid can indiscriminately throw or give anything away, lose anything, or act in a neighborly fashion and loan anything belonging to Uncle Sam. At the beginning of each administration he pokes about into every part of the White House, writes down in a book everything which the house contains, even to the smallest kitchen spoon. Then each year there must be an accounting and if the inventory does not tally with the "stock on hand" he must know the reason why. Nothing escapes his eagle eye, no detail is too small to be overlooked—a worn-out sheet or towel is noted: even each plant in the White House greenhouses must be accounted for. Lost articles must be reported and the loser must go through a "bad half hour" before they are replaced, for there is a rigid inquiry. A simple reprimand follows; but should the losses be frequent or valuable the axe falls on the offender's head. Furnishings which are deemed worthless in this scrutiny are condemned and sold.

There is so much red tape attendant upon loaning anything belonging to the White House that the borrower has time to forget he wanted it before it is decided he can have it. Washingtonians remember the predicament of the late Senator Brice in the Harrison Administration when he wanted to borrow the band stand belonging to the Executive Mansion for one of his own garden parties. Thinking he had but to ask for it, his secretary approached first one and then the other of the White House property custodians. From them to State and War Department officials he hastened until at last he was confronted with the fact that only by a Special Act of Congress could the band stand be loaned. Even a Vanderbilt could not have a palm which Uncle Sam wanted to get rid of. It had grown to such a height that it was too large for the conservatory; no other satisfactory place for it was available and Mrs. Vanderbilt had spacious enough quarters for it. Two sessions of Congress passed before Uncle Sam could part with it, and alas! the palm had withered and died by that time. Uncle Sam holds his possessions with a strong hand.

So many people think of the Executive Mansion as large and spacious, yet *there are but sixteen rooms available for the private use of the President's family.* There are but seven bedrooms, each with a bathroom, and four of the bedrooms have small dressing rooms adjoining, and as frequent guests are to be reckoned with, the Chief Executive's wife has the same problems as most modern housewives in looking after guests. There are often makeshifts and contrivances practiced by the mistresses of the White House. Mrs. Grant had special

Dickering for the Delegates Is Under Way

Clever Politicians Working for a Candidate Get in Their Best Licks Long Before Nominating Convention Time Rolls Around

By AARON HARDY ULM

RECENTLY a promoter of the interests of one of the men now in the pre-convention tryout race for President dropped in on a party leader. The two chatted for a half hour about everything and nothing, except the business that caused the visitor to call. But as he got up to go, the visitor remarked:

"By the way, I wish you would suggest someone who will look out for Mr. So-and-So in this state."

"Certainly," the party leader replied, giving the name of a lieutenant.

"We have that state," declared the promoter of Presidential aspirations when he reported.

"Did Blank say he was with us?" he was asked, Blank being the party leader.

"I didn't even ask him," the promoter replied. "I asked him to recommend someone to look after our interests there. He did so and I am sure he will back up the man he recommended. In that case the state's delegation is safe for So-and-So."

And very probably it is, though the delegation had not been and has not yet been named.

To say that any candidate for President now in the open is at this time running for the office he wants is to state what is not literally a fact. He is not running for President. He is running for delegates.

At the present time he is seeking delegates who do not exist; that is to say, he is dealing in "futures," just as the market speculator may deal in corn or cotton or wheat which does not and may never exist.

And delegates who do not yet exist are being bound and "delivered" with assurance amounting to certitude.

How Manipulation Is Aided

DESPITE attempts to make it otherwise, our quadrennial contest for the Presidency still revolves primarily around the fewer than 2,500 delegates who constitute the national conventions of the two major parties. Even this is an overstatement. More properly, the fight revolves around probably not more than two hundred or three hundred persons who have most to do with naming the delegates to the national conventions and who will control the votes of the bulk of them in the conventions. The real fight now being carried on centers upon that comparatively small number of persons; three-fourths of the activity now being put forth on behalf of the candidates seeks to procure the favor of those persons.

While candidates pose for pictures, give out interviews and perhaps make speeches, their active managers and promoters "gum-shoe" for delegates, or, rather, for leaders who name or control delegates. They appeal to the public, too, but the delegates-to-be are the all-important consideration.

And the complicated methods by which delegates to the national conventions are chosen, and, in the case of one party, the additionally complicated one by which representation is apportioned, accelerate intrigue, manipulation and dickering.

The procedure by which national conventions once were constituted was quite simple. Delegates were sent to state conventions, which in turn named delegates to the national conventions. Generally both groups were uninstructed.

Now practically as many methods as there are states are used. Law or custom requires that Presidential preferential primaries be held in the following states, the dates being the ones on which these elections, barring a change in the meantime, will be held in 1924:

Alabama	Tuesday, March 11.
California	Tuesday, May 6.
Florida	Tuesday, June 3.
Georgia	Date fixed by State Committee.
Illinois	Tuesday, April 8.
Indiana	Tuesday, May 6.
Maryland	Monday, May 5.
Massachusetts	Tuesday, April 29.
Michigan	Monday, April 7.
Montana	Tuesday, May 27.
Nebraska	Tuesday, April 8.
New Jersey	Tuesday, April 27.
North Carolina	Saturday, June 7.
North Dakota	Tuesday, March 18.
Ohio	Tuesday, April 29.
Oregon	Friday, May 16.
Pennsylvania	Tuesday, April 22.
South Dakota	Tuesday, March 25.
West Virginia	Tuesday, May 27.
Wisconsin	Tuesday, April 1.

Differences in the Primaries

IN THE primaries held in these states the voters are expected to express themselves directly as to whom they want nominated for President. In Florida, however, this is optional with the party authorities.

In all but six states the voters may choose delegates to the national conventions as well as express themselves as to the Presidential candidates. In Alabama, Georgia, Indiana, Maryland, Michigan and North Carolina, the national convention delegates are not necessarily voted for in the Presidential primary but, with one exception, the national delegates are chosen in state conventions. Thus the delegates may or may not indorse the candidate approved at the polls, though they are supposed to be obligated to support that candidate in the national convention.

No certain way has been found by which delegates may be bound to follow instructions. The laws in some cases require that delegates vote as instructed on at least a fixed number of ballots and in others they are required to follow instructions only as long as the approved candidate "has a chance of being nominated." In any event much must be left to the judgment, the discretion and the political integrity of the delegates.

Convention Method in Some

ALABAMA has solved this problem satisfactorily to itself for at least the present. There the state law says that when a "native son" candidate for President is approved in the preferential primary, he shall have power to name all the delegates from that state to the convention in which he is to be a contestant. This was done to insure Oscar Underwood's having from his home state a delegation which may be counted on to stick as long as Underwood himself wants it to stick.

In New Hampshire on March 11 and in New York on April 1 primaries are called to name delegates to the national conventions, no provision being made for direct voter expression as to Presidential nominees.

In New York, district delegates only are chosen in the primaries, those from the state at large being named by the state convention method. Delegates at large also are named by conventions in Illinois and Wisconsin, where voters make direct choice of district delegates and give voice as to Presidential nominations.

In other states the pure convention method of choosing national delegates still prevails, though in some the party authorities may direct that preferential primaries be held; and it also is possible that in some, laws calling for preferential primaries will be enacted to be effective in the 1924 campaign. In Arizona, Arkansas, Louisiana and Washington the state executive committees of the parties may name the national delegates.

Thus, the machinery for choosing Presidential candidates is:

State conventions choose national delegates in twenty-eight states, two of them electing only delegates at large in that way.

In four states the state executive committees may name the national delegates.

Preferential primaries in twenty states.

Direct election of delegates in sixteen states, two of which allow for no direct expression as to Presidential candidacies.

Apportionments Are Different

THIS is particularly the arrangement as it affects the Democratic party; as affecting the Republican party it may vary somewhat but in no great particular.

The number of delegates awarded to a state in the national convention fixes the importance of that state in naming a candidate.

With the Democratic party this is uniform, the delegates from each state being exactly double the state's representation in the United States Congress. Thus California will have, in the Democratic convention, twenty-four district delegates, double its twelve United States Representatives, and four delegates at large, twice its members of the United States Senate. These more properly should be called "votes," for any state may send virtually any number of delegates to a national convention. When the number exceeds the votes allowed, each delegate is allowed one-half or one-fourth vote, depending on the number of excess delegates. Delegates chosen in primaries equal the number that vote. The Democratic party, as does the Republican, allows the District of Columbia, the territories of Alaska and Hawaii, and our non-contiguous territories, the Philippines, Porto Rico and the Canal Zone, to send delegates with full voting powers to its national convention.

The Republican apportionment differs much from that of the Democrats, though it is based on the same principle, representation in Congress and the Electoral College.

In recent years the Republicans have modified this because of the peculiar power its full application would give to the "pocket boroughs" of the South.

In the 1920 Republican national convention, the strength of the Southern contingency was reduced through the application of the following rule of apportionment:

One delegate was allowed for each Congressional district and four at large from each state. But, for each Congressional district where the Republican candidate in the prior Presidential election received 7,500 votes or more, an additional delegate was allowed. This, while making no reduction in the convention strength of Northern states, reduced that of the rock-ribbed Democratic states about one-fourth, or from about 230 to 167. This gave to the states which never go Republican about one-fifth of the delegates in that party's national convention. There was a demand that even a more radical cut be made in the apportionment allowed those states which never go Republican and where, generally speaking, that party's popular strength is meager and its organization only fragmentary. The Republican National Committee was directed to bring about further reform. A subcommittee which considered the subject recommended that district delegates be limited to districts where real Republican organizations are maintained. This would have cut those states which had 167 delegates in the 1920 Republican convention to a voting strength of 142 in the convention of 1924. The Republican National Committee rejected this and adopted the following apportionment for 1924:

Each Congressional district will be allowed one delegate and each state four "at large" delegates. Then each district which in 1920 polled 10,000 or more Republican votes shall be allowed one additional delegate, and each state which went Republican in 1920 shall be allowed three extra "at large" delegates.

This means that there will be 1,110 votes in the next Republican convention as against 984 in 1920, and 1,094 in the next Democratic convention.

Long a Source of Complaint

THE delegates from the eleven traditional "Solid South" states will have 183 delegates in 1924, or about the same proportionate strength as in the 1920 convention. Many Republican leaders are protesting against this arrangement. They claim that on anything like a close division between delegates from the North and West those from the South will hold a balance of power.

The Southern contingency in the Republican conventions has long been a source of complaint and frequently of scandal, for it usually is made up in great part of Republicans whose interest chiefly is in the political jobs they hold—or want—by appointment from Washington.

The foregoing outline indicates the complexity which has come to govern the system of choosing candidates for President and Vice-President.

These, however, are only the external complexities; the internal and less obvious ones are much more subtle and difficult. These have to do with leaders and organizations, often in the unobserved background, who and which frequently can manipulate things to reduce large blocks of convention strength to very close control.

For example, in New York, Tammany Hall and its chief dominate the situation insofar as concerns that state's large delegation to the Democratic national convention. For Tammany always can secure a majority of that state's delegation and under the unit rule this majority can vote the entire delegation as it wishes.

There is some uncertainty as to how far the unit rule still holds in the Democratic party. In 1912 that party's national convention decreed that it should not prevail in cases where state law requires the election of delegates by districts. This was on the theory that where delegates are chosen to represent a particular district they should be free to follow the wishes of party voters in that district regardless of what those in the rest of the state may want.

Hold to Two-thirds Rule

MOST delegations to the Democratic convention still are chosen in blocks rather than by districts.

The Democratic party is loath to give up the unit rule, which it regards as in line with the party's ancient state's rights traditions. It also holds tenaciously to the two-thirds rule which was fastened on the party for pure expediency's sake by Andrew Jackson in the early days of the convention system. Under this rule no candidate can be nominated except by the vote of two-thirds.

The Republicans long ago abandoned the two-thirds rule and also the unit rule. Any delegate in a Republican national convention may vote as he pleases, even in defiance of all other delegates from his state; and a majority vote is sufficient to nominate.

With both big parties, however, the convention still is "it" as far as the Presidency goes.

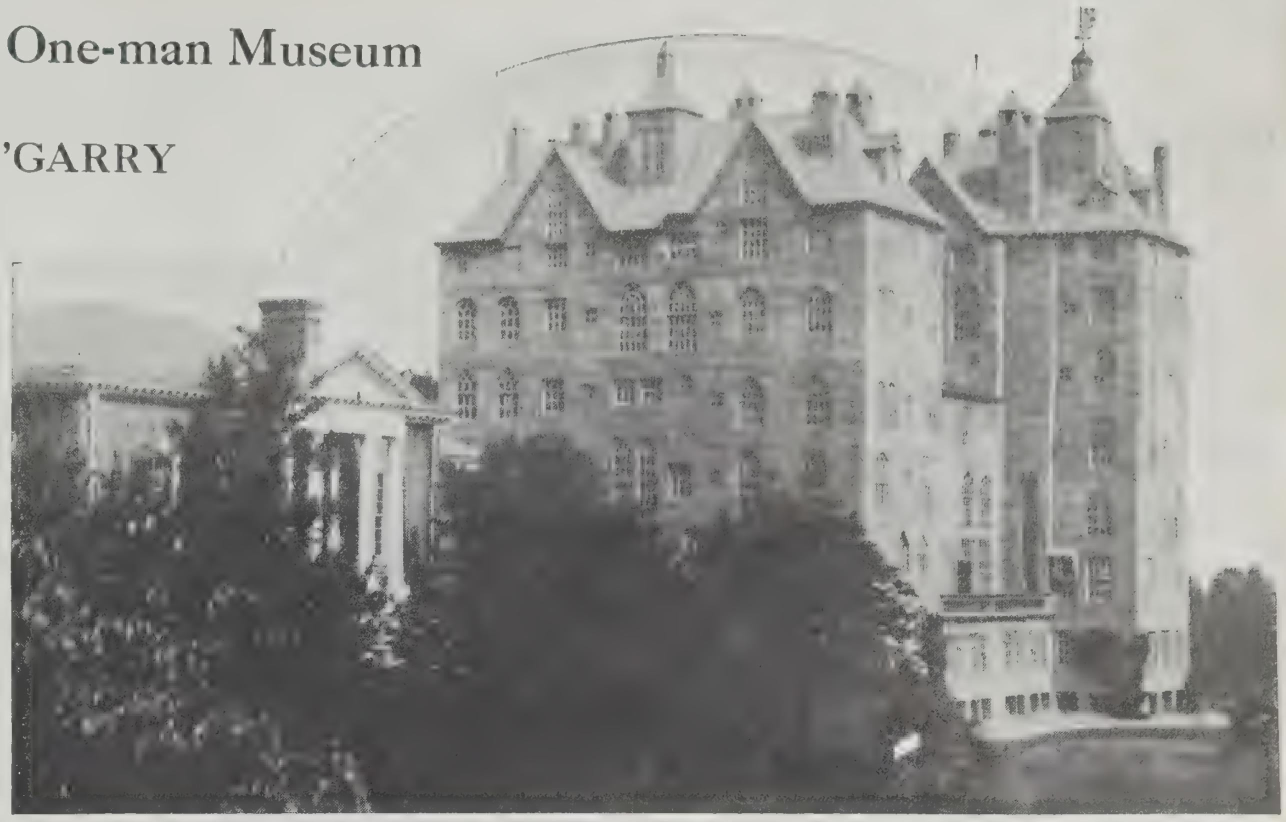
Thus fewer than 2,500 persons name the two men which nearly 60,000,000 voters choose between to select a President for the four years beginning on March 4, 1925.

In truth, much fewer than 2,500 have most to do with naming the candidates. Direct expression counts for little. The indirect influence wielded is another matter. Some delegations are interested more in carrying their states or even cities than in electing the party candidate for President. Some delegations rather would name a candidate who cannot win than to triumph with a party nominee who is so irregular he "won't play the game."

Dr. Mercer's "Tools of the Nation Builder"

Unique Collection in One-man Museum

By WILLIAM A. M'GARRY



The seven-story turreted building of the museum at Doylestown, Pennsylvania, constructed of concrete, including roof, floors and window sashes.

A ONE-MAN museum which tells probably more about the living history of the human race than any other institution in the world has been built at Doylestown, Pennsylvania. It is a one-man institution only in the sense that a single individual, Dr. Henry C. Mercer, conceived the idea, gathered the initial collection and bought the bulk of specimens since added, paid for the land and the huge concrete building housing the collections, and still directs its activities as president of the Bucks County Historical Society. In reality it is owned by that organization, by gift of Dr. Mercer, and is operated solely for the benefit and education of the public. Various efforts have been made to label it, but it is so distinctive that it fails to fall into any familiar classification.

Instead of beginning in the dim past, two thousand to five thousand years ago, this museum starts with things that, although now generally out of use, are still understandable to the present generation. It is only within the last few years that the building to make that possible has been completed, but the work that led to it was started by Dr. Mercer in 1897. At that time he called his collection "the tools of the nation builder." The phrase more nearly describes the museum than any title given to it since. It contains 19,014 specimens of ancient implements and utensils relating to the master needs of man—food, clothing, shelter and transport; and also to the needs of the spirit—religion, art, science and amusement. In addition there is a library of 8,000 volumes. Both the general collection and the library bring the story of mankind up to 1820, going back from that date two or three centuries by actual examples, and thousands of years by type, to connect with the story of early mankind as told by the relics in archeological museums.

Doylestown was a center of an early Dutch settlement. When Dr. Mercer started his collection twenty-six years ago he confined it at first to early implements used in the county. Then he extended it to take in all Pennsylvania. Finally, after he had found that similar conditions of nation building had been met and conquered in the same way by pioneers in New England and the South, it was decided to take in the United States. But the growth of the collection soon made it evident that the point of view was too narrow, since, as he stated it, "many of the objects belonged in type, not to one but to many nations and had been in use in Europe for hundreds of years." Later it became necessary to set up artificial limits to the collection, and it was confined to the United States except for such objects as were chosen for special illustration and comparison. It was determined also to stop at 1820, at the time of the introduction of the steam engine and machinery, when the United States Patent Office began to put things on record and machinery came to be fully described in print.

A building as distinctive as the collection was constructed by Dr. Mercer. It is built on a slope, so that, to judge by the windows, one tower is seven stories in height. There are two main towers flanking a central structure which contains a court open to the roof. This is surrounded by three galleries connected by gently sloping winding stairs. The entire building, including roof, floors and window sashes, is built of reinforced concrete. In the wings or towers there are thirty-three fireproof rooms and thirty-six alcoves for the display of specimens. Larger articles, ranging from looms to whaleboats and including virtually every type of land transport used up to 1820, are suspended in the great central court from hooks buried in the concrete, so that it is possible for the visitor to inspect each article from any angle by walking around the galleries and up the winding stairs.

The story of how Dr. Mercer developed this idea, which eventually will bring within reach of all a knowledge of things now confined to scholars, is quite as interesting as the romance that may be woven from an inspection of the articles in the exhibits. More than thirty years ago Dr. Mercer was curator of the American section of the University Museum of Philadelphia, then a much smaller institution but imbued with the same spirit of original research. In that post his most important work was the exploration of caves and ancient dwellings in Yucatan. Naturally, also, he came in touch with archeological excavations all over the world, and he was much impressed by the difficulty of reconstructing a picture of ancient civilizations with the meager finds made.

"It soon became evident," he says, "that the archeologist working in the site of an ancient civilization could expect to find only such articles as had been made out of non-perishable materials, and they were so few and far between that it was a difficult task even to classify them and at times impossible to indicate their specific use. I left the museum because of ill health about that time. In riding about the country I came across a man who made a business of buying up what he called junk at auction sales. Contents of attics and ancient barns were hauled to such sales by the wagonload. One day I went to this man's yard and found the most amazing collection of implements that were absolutely new to me. It was quite plain, however, that they had been constructed by pioneers who had no time to waste on experiments, and that each must have a definite use.

"Then suddenly it occurred to me that the archeologists had been working from the wrong end, so to speak. They had been puzzling their minds over things that they could not understand merely because they had not taken the path plainly indicated. I promptly bought up the collection and stored the stuff in the rooms of the historical society until the then secretary complained that he couldn't find room to write out his reports. Likewise I started to make a collection of implements and utensils, filling three barns with my purchases. I came in for a great deal of criticism at the time. I was told that these things had been discarded and were of no use. As a matter of fact, I couldn't prove the use of many of them. But in 1897, when it began to look as if I couldn't get anybody else interested in the collection, it occurred to me that I might stage a real demonstration of its value. Accordingly, I began to visit the homes of aged settlers. They are all gone now, but at that time there were many still living whose memories ran back to the early years of the nineteenth century, and who could recall tales told them by their parents and grandparents.

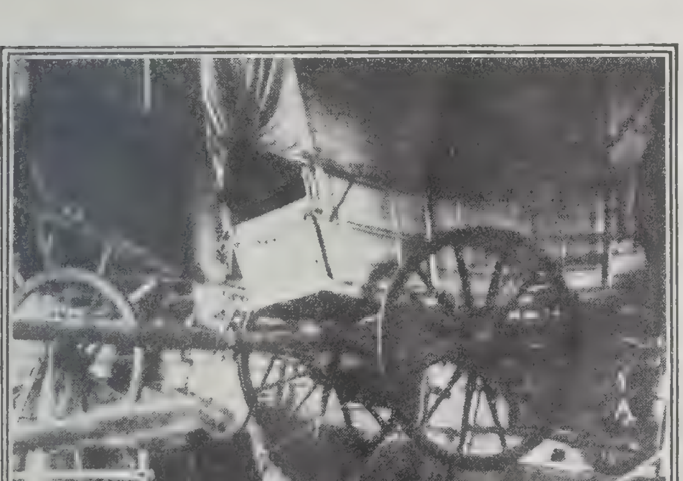
"A group of these men volunteered to give a demonstration in the public square at Doylestown of the uses made of all sorts of ancient implements in my collection. Up to that time I had made only a partial classification. Not being sure of my ground I had mixed things up a bit. The old fellows soon put me right and the demonstration was a huge success. It convinced many of the leaders in the historical society, and many of the people, that this 'old junk' was an invaluable bridge to the past. Therefore I continued the collection, but it was not until many years later that the time became ripe to construct the present museum building.

"Clothes change with climate, nationality, calling, time, and so forth," says Dr. Mercer, "and their much observed variations, shown in collections of costumes, are transient and superficial things, compared with the tools that make clothes, some of the chief of which shown here as used by our ancestors, have remained fundamentally the same for more than two thousand years."

This similarity is found in other lines, to be sure, but it is nowhere so striking as in the collection of utensils relating to the master needs—the first needs—of man; food and clothing. Sheep are sheared today by machine tools, but the old-fashioned shears developed thousands of years ago are still in use on small farms throughout the world. The principle of the spinning wheel has not changed. Examples at the museum include the original wool wheel, used by early American settlers, which was without the later bobbin and flyer. "In examining these three devices for spinning," says Dr. Mercer, "we should remember that none would work unless the fiber was proportioned and slightly twisted, as it was when fed to the spindle by the human hand. That was a very important but little noticed part of the process, which explains why so many of the very complex machines in the modern factory were invented, not to spin the thread, but to supply this essential preliminary work formerly done by the human thumb and finger." In the museum's collection of tools used for cooking, including the huge old-fashioned ovens by which bread was baked by the first American white men, it is possible to show that man has learned very little in thousands of years. The earliest man soon learned that there were seven basic ways to cook his food, and although highly complex machines have been developed, the principle is always the same. The museum classifies these seven methods as follows, showing exhibits of the various utensils used in each; the gridiron for broiling by direct heat above the fire; the spit, tin kitchen, jack, and so forth, for roasting, using direct heat at the side of the fire; the Dutch oven or baking pot, buried in the embers, and the coffee roaster for baking by indirect, confined heat; the griddle or bake iron for baking by indirect but open heat; the pots and kettles, coffee pots, of cast iron, copper, tin or earthenware, for broiling; the skillets of wrought or cast iron or clay for stewing, using the slow heat of water, and finally the frying pan for the use of heat with grease.

In the food implement collection the museum shows chains, branding irons, milk stools, yokes, cowbells, jumping sticks, nose rings, horn knobs, hog catchers, nest eggs, bee gums, coops, knives, traps, snares, fish nets, pigeon nets, spears, calls, decoys, powder and priming horns, early rifles and shotguns, including the matchlock and the later flintlock, and an almost con-

(Concluded on page 15)



This view gives some idea of the multiplicity of exhibits in the museum of the Bucks County Historical Society at Doylestown. The vehicle at the top is a Conestoga wagon; in front of it in the upper right-hand corner is a wooden Indian; in the upper left corner can be seen one wheel and the seat of an old-time sulky; just below that is an early type of sleigh. Beneath the wagon in the center and at the bottom are small boats used by early settlers of America, and grouped around and behind them a great variety of implements.

Bible Greatest Seller Every Day, Every Year

Translated Into 700 Languages; Rare and Valuable Volumes in New York Exhibition

By FRANK DORRANCE HOPLEY

A NEW YORK department store recently conducted a three days' sale of radio outfits, during which time some thirty thousand are said to have been disposed of. Crowds of people choked the aisles of the store looking for the special sale in response to full-page advertisements in the daily papers, and that particular department of the store was kept open each night several hours beyond the usual closing time to accommodate the throngs. A great commercial feat, it was considered by many.

Yet every day of the year, twenty thousand copies of the Bible are bought and paid for, and sixty thousand distributed gratuitously, and all this without noise or clamor or shouting from the housetop.

The tremendous sale and circulation of the Bible, even in these days when we have become accustomed to think in gigantic figures, almost staggers the imagination. Careful estimates, furnished by the New York Bible Society, state that more than thirty million copies of the Scriptures are circulated every year, and of that number more than six million copies are sold by commercial houses for profit.

Not many books have reached the circulation of two hundred thousand in any one year, and if they have it is usually during the first year of publication, when the book is being advertised and commented upon by the literary critics.

Of one novel, nearly a million copies have been reported as sold during its initial year, and the circulation of the Bible last year—not in its first year, but its nineteen hundredth—was thirty million copies.

The circulation of the Bible is not confined to the English-speaking world. Comparatively few books have been translated into many foreign languages. The latest report of the New York Bible Society, in speaking of the myriad tongues in which the Bible may now be read, says:

"The Bible, too, sells in more languages than any other book. Some of us are familiar with two or three languages, but the Bible has been translated into almost seven hundred languages; nearly two hundred African languages, as many more in Asia, a hundred Australian and Oceanic languages, fifty European and two-score American languages.

"'Uncle Tom's Cabin' was translated into twenty-three languages, the 'Pilgrim's Progress' into more than forty; how small the number compared to seven hundred! All of this means that the most popular book, the Bible, has been circulated more widely than any other book. Yet widespread as the distribution of the Holy Scriptures is, there are millions of persons who have never seen a copy. At the present rate of circulating the Bible—thirty million copies a year—it will require fifty years to give every inhabitant of the globe a copy of the Book of Life."

One reason the Bible is a best seller is that it meets the wants of humanity in a manner more satisfying than any other known book. Among its forty contributors are to be found men from all walks in life, from the humblest to the highest, from the ordinary citizen to a king.

No book was ever written that compares with the Bible in the variety of subjects treated between two covers; politics, law, history, adventure, mystery, poetry, counsel, love.

W. F. Yust has well summed up the Bible in his essay entitled

"THE BOOK.

"I am the recorder of the gate.

"I speak every language under the sun and enter every corner of the earth.

"I bring information, inspiration, and recreation to all mankind.

"I am the enemy of ignorance and slavery, the ally of enlightenment and liberty.

"I am always ready to commune with man, to quicken his being, to spur him on, to show him the way.

"I treat all persons alike, regardless of race, color, creed or condition.

"I have power to stretch man's vision, to deepen his feeling, to better his business, and to enrich his life.

"I am a true friend, a wise counsellor, and a faithful guide.

"I am silent as gravitation, pliant and powerful as the electric current, and enduring as the everlasting hills.

"I am the Book."

Not only is the Bible the best seller and more sought after than any other book; it is also the cheapest book.

In attestation of the popularity of the Bible, and the place that it holds in the affection of the present-day public, may be cited the exhibition of old and rare Bibles held in the New York Public Library. The main exhibition hall was devoted to this purpose, and proved none too large to accommodate the throngs who daily visited the exhibition.

Long, glass-covered tables were arranged in rows with aisles between, and under glass were Bibles of every description. This collection of Bibles is said, in size and antiquity, to be second only to that in the British Museum.

Here could have been found the great Greek codices, polyglots (printed in a number of languages), an early Samaritan Pentateuch, Hebrew rolls, and other Bible manuscripts of the ancient versions. Some of these volumes are almost letter perfect, and took many years to complete. The reason for this may be explained by the fact that when the Hebrew scribes first began to copy the Bible, they were required to throw away a skin of vellum every time that they made an error, and whenever the name of the Lord was written they were obliged to stop and repeat a prayer, then take a fresh quill before the copying was continued.

In the exhibition were Bibles in many different languages. The Latin group is especially interesting, the principal volume of which is the Gutenberg Bible, which was printed at Mainz, Germany, between 1453 and 1455. It is the first Bible printed on a printing press. It consists of two volumes, forty-two lines to the column, and there are but two columns to a page.

In the collection of French Bibles the one that attracts especial attention is a copy which once belonged to Diane de Poitiers, who was the mistress of Henry II. There is shown on one page a representation of St. Paul handing out the Epistles.

In the English group is to be found what is called "Matthew's Bible," which was printed in 1537, and named after the compiler, who was known as Thomas Matthew, but whose name in reality was John Rogers.

Another English Bible printed in Geneva in 1560 by Rouland Hall was the first English Bible to have divisions in verses, and the well-known King James Bible, printed in London in 1611, is still the accepted text by many adherents of the Church of England.

The first Bible produced in America was printed on a press in Philadelphia in 1782; another was printed in Trenton, New Jersey, in 1791, and the first Bible printed in New York was under date of 1792—the "Self-Interpreting Bible"—to which subscriptions were sold, the name of "George Washington, Esq., President of the United States" heading the list.

There are Bibles in Eskimo, Bengali, Chinese, Hawaiian, Zulu, and in many of the Indian dialects of the North American Continent. Small Bibles are in existence, so small that the print has to be read with the aid of a powerful magnifying glass; big Bibles, ponderous and clumsy, with yellow-stained leaves, and two Bibles that are printed entirely in shorthand bearing dates of 1660 and 1695.

"Curious Bibles" are Bibles in which a typographical error has been made in the printing, and a verse is made to appear strange and sometimes ridiculous. Each of these Bibles takes its name from the particular error that has been made.

There is the "Vinegar Bible," so-called because in the Parable of the Vineyard the printer has put in bold letters across the top of the page, the astonishing announcement, "The Parable of the *Vinegar.*"

Another is the "Placemaker's Bible," a verse in the Sermon on the Mount in the fifth chapter of Matthew having been made to read: "Blessed are the *Placemakers.*"

The "Ear Bible" is that wherein the verse is given incorrectly: "He that hath ears to *ear* let him hear."

The "Unrighteous Bible" is full of errors, the most startling among them being the statement that "The *unrighteous* shall inherit the Kingdom of God."

Then there is the "Wicked Bible," of which it is said there are but six copies now extant. The entire edition was called in and was supposed to have been destroyed, when it was found that the printer had left out the word "not" in the Seventh Commandment.

Another interesting Bible of the "Curious Group" is called the "Breeches Bible," which bears the date of 1560. It has been given this name because the word "breeches" has been substituted for "aprons" in Genesis, Chapter III, Verse 7, which has been made to read: "And they sewed fig leaves together and made themselves *breeches.*"

Finally, there is the "Treacle Bible" which was printed in London in 1538 by one Richard Jugge. In Jeremiah VIII: 22, instead of the well-known rendering "Is there no balm in Gilead?" it reads: "Is there no *treacle* in Gilead?"

BIBLIA
The Bible that is, the holy Scripture of the Olde and New Testament, faithfully and truly translated out of Douche and Latyn in to Englishe.
M.D.XXXV.

Title-page of the first complete English Bible, 1535.

Mr. Ford's Page

THE Declaration of Independence was not a meal ticket nor was the Constitution of the United States a commercial contract, yet it is true that but for the physical resources and material prosperity of the people who conceived the Declaration and drew up the Constitution, neither document would have survived to mean more than an idealistic scrap of paper.

That statement is made that it may serve to balance another, namely, no nation has the right to sacrifice everything, nor even a single thing involving principle, for what seems to be prosperity. There is a prosperity which is illusion, to perpetuate which is to invite sad disenchantment. The prosperity that needs such sacrifice for its continuance may at once be scrutinized with suspicion.

Because it has been suggested that this country should not jeopardize its present fairly satisfactory situation by indulging in unwarranted political excitement during this Presidential year, there has not been lacking those who have charged upon the authors of the suggestion a willingness to barter mere material well-being for political freedom. Extremists have gone so far as to charge that indeed a Presidential election was being purchased by a prosperity which exists solely through the permission of the money brokers.

TO PREVENT upsetting business by needless political upheaval does not mean surrender to the money-brokers or favoring them as the source of industry and prosperity. These brokers have tampered with prosperity in the past, on the strength of two delusions: they had persuaded the Government that they were the fountain of economic life; they had persuaded industry also of the same thing. In the battle between creative Industry and money brokerage, Industry has won. Recent Presidents have so clearly seen the true state of affairs that it is expected, in the battle between Government and Money for the supremacy, Government will win. There is a present confidence that the Administration now in office will not concede anything to financial juggling in the delusion that it is creative or even defensive of the national interest.

It is pretty safe to rely upon the unlikelihood of Americans surrendering any item of their rights for any weight soever of material bribes. Children of fathers who endured physical deprival, if thereby their principles might be kept alive, are not likely to be swerved from the straight view of Right by the dangling of "the full dinner pail" or any other device.

Yet it will be conceded that one condition of our freedom is our liberation from economic stress. In fact, liberty is not completely liberty while the necessity or the possibility of economic bondage remains. While it is true that man does not live by bread alone, it is also true that as man he does not live without bread.

There are four liberties, and we have made conquest of but two of them.

There is first, personal, physical liberty—the right of a man to his own life, to freedom of movement, to the ownership and control of his own body and his personal life. Men won that freedom when they ceased to be serfs, mere attachments to the land which was owned by overlords. Then there was political liberty, freedom from the tyranny of political lordship, a voice in the communal life, liberty to set up institutions expressive of the spirit and progress of the people. Men have won that freedom, in part; theoretically they have a voice in their own government; they have the right of consent to government. These two forms of liberty have been won.

Then, third, comes economic liberty, freedom to live and make a living, to profit by labor, to be free from an unjust pressure exerted through economic necessities. While we have not attained that full measure of freedom as yet, and can not until we are wiser and more just ourselves, still we have made an irregular progress in the past century which must be counted as progress though it has brought some undeniably undesirable accompaniments with it. We are in the period of the winning of economic liberty now. Of spiritual liberty—utmost freedom of the mind and the heart and the soul, because such freedom has been won by wisdom and righteousness—there is no need now to speak. Without it, however, there is no liberty in the widest sense.

It is not worth much to have physical and political freedom if you have nothing to eat, and to eat while physically and politically enslaved is to eat the bread of bitterness. The benefits must be connected and coincident to be most beneficial to us.

We have ground to hope and believe that this Administration is able to distinguish between true and false prosperity, and firm to yield nothing to the false. The time is near, if it is not already arrived, when the American Government will give some sign that it does distinguish between the creators of real wealth and the money-brokers, and will have no more to do with the latter.

Immortality has twice crowned the Presidency, once when Washington fathered the new Republic, and again when Lincoln, performing a harder task than Washington, saved it. One delivered a people from political subordination; the other delivered a race from physical slavery. The next immortality will rest upon the President who destroys the strongest engine of economic inequality and oppression by destroying *all private privilege in the public instrument which we call Money.*

Our greatest Presidents have always seen this. Jackson saw it, and his analysis of it has an uncanny ring of modernity as if he had spoken today. But Jackson was engulfed in his own fight and could not reach out to the wider issues involved. Lincoln saw it, saw it with a poignant pain that formed a great part of his burden. But Lincoln had a war to fight and the Union to save. Lincoln saw more clearly than any man of his time the connection between the money power and the force which menaced the Union of the States. And that money power was not Southern either; its source was alien, and its seat was the North and East. There is no doubt that had Lincoln survived the war, his next fight would have been to rid his country of a power which was a constant threat and which would increase in dangerous potentiality as the country grew. Roosevelt saw it, but succumbed to practical considerations too early. Wilson saw it in his "New Freedom," but Wilson's constructive program, so promisingly begun, was interrupted by the terrible necessity of fighting the war. Harding saw it, and questioned whether he was strong enough to issue the challenge, whether it was just the right time to subject the country to the anger of the money lords —and while he was debating, lo, death came and relieved him of the task.

There have been Presidents who never saw it, or seeing it sided with the power of money; there have been Presidents who saw it but were prevented from acting upon their vision. In the Providence which has been so signally evident in the life of the Republic, this last great contest, the battle for the new liberty, has been reserved for a strong hand which like Washington's and Lincoln's will not hesitate though all the darkness of defeat comes before victory. When that hand shall be lifted for the people's leadership no one knows; but the destined man, when he arrives, *he* will know and he will act.

Nothing could be more solemnly the duty of the Government than to see at this time that no harm befalls the people's living. That which is born of labor, and widens the opportunities of labor, and secures the fundamental rights of labor, is sacred. But there is that which does not labor, which does not create, which does not increase wealth, but is an ever-growing charge against wealth, an ever-increasing burden upon producers, and an ever-present menace to economic rights and independence. And it is this thing which boldly announces that *it* is prosperity, that without *it* the country sinks. And public men have been bullied, bought or simply deceived by its claims.

The Administration should know the difference between the true capital of production and the imposing gambling stocks of the money-brokers. To strike the one is to injure the nation; to strike the other is to make toward the new freedom.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Investigations That Wilt

THE public must have been impressed by the vast number of investigations which have been made in consequence of the crooked administration of war activities, and the very little that has come of them. Mountains of gross irregularities—worse than political graft, because they involved a nation distressed by war—were proved to have existed, and yet in instance after instance the investigation has been halted at just that moment when the core of the matter was about to be disclosed. When Democrats have investigated for the purpose of getting campaign material against Republicans, they have found so many of their own party involved that it was impossible to serve a partisan purpose by further inquiry; and when the Republicans came in and sought to show what a fiasco the Democrats had made of war administration, they found so many Republicans involved that their partisan purpose also failed. So the investigations have been stopped.

Then there has been a point when the next step was to uncover the "higher ups," men who were not professional politicians but the financial backers of the parties, and there again the investigations have halted. Other inquiries have been dropped because the person under fire was found to be only one of such a large number that the likelihood of bringing them all to equal justice was very remote.

The total result to date is the knowledge that dishonesty prevailed to an extent that indicates a most complete organization for the purpose of robbing the people when at war.

Looking at the matter as a whole it is clear that investigations failed at the outset because of the unworthy purpose that motivated them. Partisan or personal revenge is a purpose that never completes a constructive work. The loss to the people is not the failure to fasten guilt, but the failure to uncover the *system* which enabled graft to be practiced on a colossal scale.

It is worth suggestion to the President and Congress that, in view of the value of such knowledge to the nation, particularly in the recurrence of war conditions, a complete study of the grafting system be made for the purpose of being ready instantly to detect and repel its revival at another time. If necessary, let the questions of party and persons, of responsibility and guilt, pass. Give a general amnesty in advance, if necessary. But get at the principle and practice of this dangerous thing. Congress could do worse than appoint a research committee to study and report upon the system, the philosophy, the fellowship of dishonor, which makes such combinations possible in an enlightened nation.

Concerning Taxes

REDUCE the taxes? Everybody says yes. Yet a growing number of citizens recognize that something more than that is needed: the whole tax situation calls for revision and establishment upon sound foundations. Given authority, it is easy enough to lay a tax. Given political prestige to be enhanced or harmed, it is easy enough to get at least the intention of laying taxes fairly. But taxation itself, as a principle and a practice, is in a most chaotic state, which accounts for the virility and increase of various tax philosophies among which the most virile perhaps is the Single Tax idea.

The central fallacy of our system is that it taxes *people* instead of *things*. Would that some statistician could take a specific taxable amount of $200 in a small income and trace the number of times that $200 is taxed—not once, as $200, but 200 times if that amount becomes part of the taxable income of 200 persons. It is the person who is taxed, not the wealth. You received that $200, and paid on it; also you paid it out to a physician for an operation and he paid taxes upon it, too; the physician paid it out to the surgical instrument manufacturer, the latter paid taxes on it also; and so on until it becomes a question whether the $200 exists at all at the end of the process. Citizens are taxed, not their wealth.

Flowing from that central fallacy are others, principally the resulting inequality. There may be large concerns who share the tax levied upon them, but if so they should make themselves known to avoid the haunting suspicion that there are none such; it is generally believed that the working public pays all the taxes, just as it is the working public that supplies all the capital upon which our enterprises are built. Taxes are shifted to the last man who has no one else upon whom to shift them. Tax property; the tax appears in the rent. Tax commodities; the tax appears in the retail sales price. And so on.

Taxation is one of the profounder mysteries of the political organization of the peoples, and may be used to their help or their hurt. The time has come for a wider public thoughtfulness about taxes, not as sums of money inconveniently demanded from us, but as representing a national power whose right principles have not yet been discovered, or if discovered not recognized, by government.

Who Builds the School

THE propaganda, sent out in the name of the American Bankers' Association and published in many country papers, includes a defense of interest by William Trufant Foster. Having shown that Farmer Brown would doubtless pay his neighbor for the use of a harvester, he should expect to pay for the money he borrows to buy one of his own. All of this is true, but it does not disclose the net cost of each operation. If he rents a harvester, the rent stops when the job is done; when he rents money his rent continues until he has paid it back.

But Mr. Foster applies the same principle to borrowing for public improvements. He cites the building of a new schoolhouse with borrowed money, and claims the banks should be paid for the use of the money paid for the bonds issued to build the school. This does not follow by any means.

The school building is paid for in taxes. Under ordinary circumstances a bond issue of, say, $100,000 at five per cent for thirty years will have cost in addition $150,000, making a total of $250,000 to be paid for a building that usually must be replaced as soon as paid for. Now, if a banking syndicate buys the bonds they will be accepted by the United States Treasury as security for the issue of an equal amount of currency, thus leaving the interest from the bonds and the money to lend for another school or other public building. And behind almost every proposition to bond the public can be found the interest-grabber urging the creation of a new debt.

The United States issues the money on the school bond without charge. Let it issue it direct to the school district, instead of to bankers.

To care for this bond issue and usual interest, the taxpayers must pay more than $8,000 a year for thirty years, while the non-interest-bearing bond, if it runs as long, would cost but $3,333 a year. The total saving in any manner of payment is one and a half times the cost of the building itself.

This plan does not alter the method of supplying money at all. It does omit the middleman, who neither creates nor strengthens the money system. It involves no danger of cheap money that does not exist now, for there is no present limit to the amount of Federal Bank currency save the judgment of those in control.

The only backing of our present currency is the faith and credit of the country, and that would not be changed.

Every dollar put into a public building is contributed by the taxpayers, as is every dollar paid in interest to the bondholders, who, in effect, have nothing invested. For public bonds are the security upon the issue of money to the banks by the taxpayers of the country. Hence the taxpayers, who pay the cost in any event, under the present system, furnish the security and borrow their own money. The bank through which the deal is made simply collects for the use of the money by the people, and has the money on hand to lend Farmer Brown to buy his own harvester, for which he also pays interest, and more interest because the school district is a competitor in the market for loans.

Senator Lodge

IT IS not precisely an American custom to bestow praise on Senator Henry Cabot Lodge. It is not even usual to give a fair measure of appreciation when he performs a meritorious piece of work. This is the penalty paid by conservatism in our hurrying age. Senator Lodge has been so constantly advertised as the last citadel of reactionism that the picture held of him in many parts of the country is that of a man resisting all that is progressive and defending all that is dried up and outworn. Yet the great commonwealth of Massachusetts continues to send him to the Senate and men charged with governmental responsibility seek his stores of knowledge and his counsel.

To give the devil of conservatism his due, Senator Lodge is regarded by serious students of national policies as having performed two distinctive services to the people of the United States, both of these services being in the realm of foreign affairs. He raised and led the opposition to a League of Nations covenant. This, whether to his praise or blame, will be conceded. At the time he suffered the extreme of his unpopularity, but longer observation and deeper study of the question by the people have brought American public opinion largely in line with his position. His opposition is not understood to be against any international league for peace, but against a covenant that was based more upon European fallacies than upon American ideals, and consequently futile where it was not positively dangerous.

Latterly the second service has been performed, his brilliant, dispassionate and complete study of the question of recognition of the Bolshevik rulers of Russia. Senator Lodge did not by any means go as far as he might have gone in his statements; he kept his position well within the political question involved, and has clearly proved that any recognition we might extend to the present so-called government of Russia could not, from the very nature of that government, be an agreement with the whole government of Russia. We should be taking one tentacle of Russian governmental power in our hands as token of international enmity, while the other tentacles would remain unsworn and free to carry on the Soviet propaganda of hate for our free institutions. No monarchy in Europe has ever hated American freedom as much as the Bolshevik government has hated it, and no monarchy has ever dreamed of the sinister assault which Bolshevism has everywhere made upon Americanism.

Senator Lodge's position on this question is impregnable, and that he has perfect confidence in the quality of his facts is shown by his appointment of a committee to consider the question, on which committee he has appointed some of his strongest opponents. Those who wish to understand the true inwardness of the Russian question should secure and read the Lodge speech before the Senate.

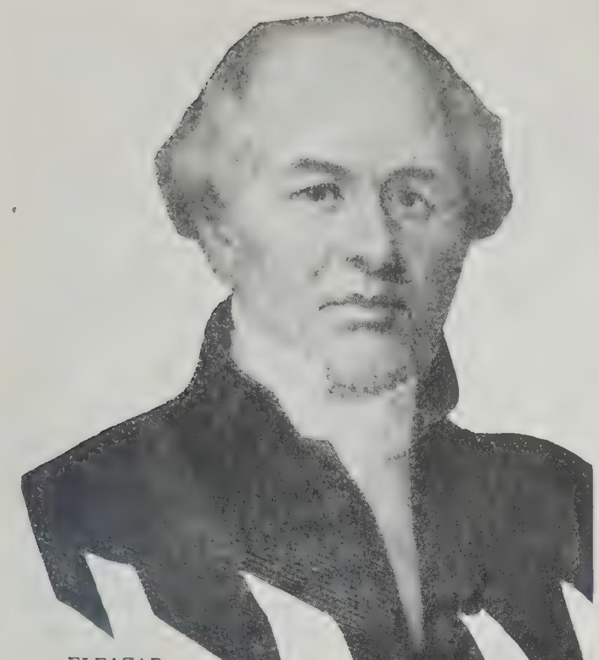
"Sunday Parties in Capital Gain in Favor," reads the headline on a society page. The news printed beneath shows that everything from dinner parties to dancing parties is being given by persons who are presumed to be respectable, but who are not respectable enough to show respect for one of the distinctive Christian Anglo-Saxon institutions, the sabbatical day of worship and rest. Dancing parties in high circles at Washington on Sunday are a disgrace to those who participate in them. The excuse given for this growing practice is almost grotesque—they do it, they say, that they may squeeze in all the society functions they can before Lent! To keep Lent they dishonor the Christian Sabbath. Because it is more fashionable to keep Lent, and rapidly becoming less fashionable to keep the Sabbath. We are glad to say that, so far as the society news discloses, none of our government officials have lent their presence to those affairs. In France, for example, they hold their elections on Sunday. But, then, look at France! It is probably no mere coincidence that the nations freest from the world blight today are those nations which have reverently observed the first day of the week.

After the wild orgy of the press in giving coast-to-coast publicity to every medical fake who had ability enough to invent a headline, it is refreshing to learn that the North American Newspaper Alliance has availed itself of all the facilities of the American Medical Association to make a scientific examination of all medical bidders for publicity. Any arrangement is preferable to the cruel game that has been played on the more trusting part of the community during the past few years. The new service will be carefully scrutinized to see if it is in the proper hands and able to fulfill its announced promise.

Mysteries That Have Lived in History Without Solution

Who Was the Man in the Iron Mask? What Became of the Dauphin of France?

By GEORGE S. BRYAN



ELEAZAR WILLIAMS
He was once believed by many to be the "Lost Dauphin."

TRUTH, in the old saw, is stranger than fiction; and certainly many an enigma of real life is more baffling than the inventions of the story-spinners. For, as often has been said, no laws of artistry constrain real life to keep within the limits of the plausible; nor is real life bound to bring to its problems an ultimate solution. Who wrought and placed the megaliths of Easter Island, that loneliest bit of earth in all the seas? What was the truth of the Affair of the Diamond Necklace? What became of Charley Ross, of Ambrose Bierce? What was the secret of the bark *Marie Céleste?* Who wrote the "Letters of Junius"? No one knows. No one is likely to know.

Who was the Man in the Iron Mask? After much ingenious research and the publication of many volumes, all that we can rightly say is that he was a political prisoner in the reign of Louis XIV of France, and that in 1703 he died in Paris within the fortress-prison of the Bastille. Even his "iron mask" is unsure—the actual mask was probably of black velvet only. He remains a nameless, romantic figure, the subject of endless speculation. Already a mystery before he died, he is a mystery still. Around him for more than two centuries have collected not alone judicious studies but also vain rumors, mistaken theories, idle arguments.

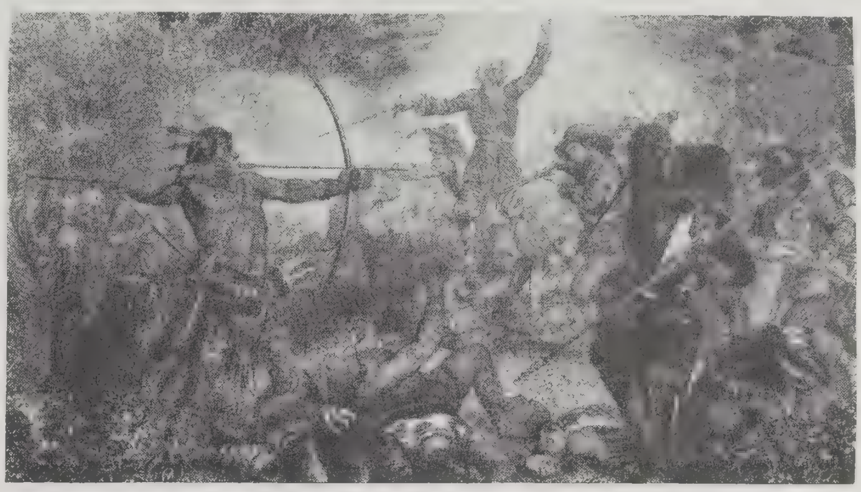
He and his fate have stirred the pens of such men as Voltaire, Dumas the Elder, and Andrew Lang. By other writers he has been quite impossibly identified with Fouquet, Louis XIV's deposed superintendent of finances, who died in 1680; with the Duke of Monmouth, who was beheaded in London in 1685; with Molière, who, as we are well enough aware, passed away at about ten in the evening of February 17, 1673. These are far from being all the strange conjectures. So late as 1908, Monsignor Barnes, in his "The Man of the Mask," held that the prisoner was "James de la Cloche," who died at Naples in 1669, and of whom more presently. Dumas is responsible, through his "Le Vicomte de Bragelonne" ("Ten Years After"), for the wide, uncritical acceptance of the notion that the "Masque de Fer" was none other than a twin brother of King Louis.

What are the few known facts? Étienne du Junca, the king's lieutenant at the Bastille, kept a notebook. In that notebook he told of the arrival of a prisoner whose name was never mentioned and whose face was always masked. Later, he recorded the prisoner's death and burial. The date of arrival was September 18, 1698; of death, November 19, 1703. The prisoner was brought by a new governor, Saint-Mars, who (so Du Junca says) had first taken charge of him at the fortress of Pinerolo, many years before—more than twenty, certainly, for Saint-Mars was transferred from Pinerolo to Exiles in 1681. Saint-Mars came to the Bastille from the fortress of the Ste. Marguerite Islands, in the Bay of Cannes, where he had been commandant since 1687. We further have a facsimile of the register of the parish cemetery of St. Paul, whence we learn that the unknown was buried under the name "Marchioly," and that his age was given as "about 45." (Both age and name we may safely assume to be false.) That is all. Who was he? Why was he treated with precautions exceptional even for those times? What secret have we here of cruel revenge, of royal fear, of long years of loneliness and gloom?

Research has tended to limit the possibilities to two. The man, say the experts, must have been either Ercole Mattioli or a person bearing the prison-name "Eustache Dauger." Mattioli, a minister of the Duke of Mantua, sold to Louis XIV for 100,000 crowns the frontier stronghold of Casale—then, for reasons not now clear, betrayed the bargain. He was kidnapped by the king's orders, and under the name "Lestang" was, as we know, put into solitary confinement at Pinerolo. As to who "Dauger" may really have been, opinions are not agreed. The truth is that, sooner or later, every hypothesis regarding "the Mask" encounters objections, every surmise runs aground. The puzzle is as profound and interesting as ever.

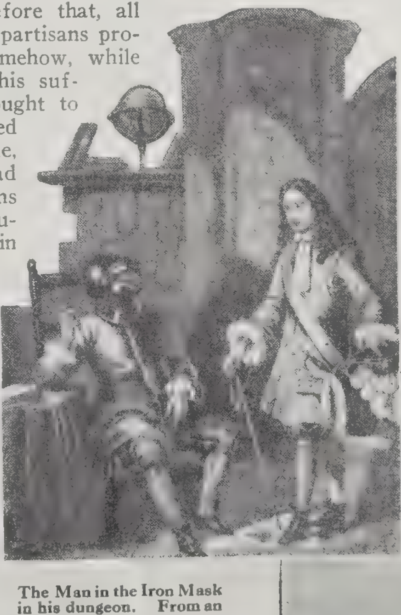
What became of the so-called "Lost Prince"—the little Dauphin of France, whom the royalists called Louis XVII? With his mother (Marie Antoinette), father (Louis XVI), sister (Marie Thérèse Charlotte), and aunt (Madame Élisabeth), he was imprisoned in the Temple in 1792, when he was a little more than seven years old. After his father's execution in 1793, many plots were afoot to effect his escape. He was finally separated from his mother and placed in the care of Antoine Simon, a cobbler, and Simon's wife, Marie Jeanne. The Simons abruptly quit the Temple in January, 1794; and then, after a period of neglect, the child received a new attendant. In May, 1795, it was given out that the dauphin was ill; later, it was announced that he had died on June 8 following and had been buried in an unmarked grave. So runs the surface account.

This account quite fails to explain several odd circumstances. The body was never properly identified, although a word from the sister would have sufficed. The surviving members of the royal family did not go into mourning or otherwise act as though the supposedly dead king were really dead. Plentiful evidence exists to show that within the walls of the Temple there was substitution of another child, or of other children, for the little Louis Charles. For example, Lady Atkyns, an Englishwoman who for years lived in France and who spent money freely in attempts to get the royal prisoners out of the Temple, succeeded in having a child turned over to her representatives; but the child proved to be a deaf-mute. This dovetails curiously with the statement that from the close of October, 1794, the dauphin obstinately refused to answer questions put to him by official inspectors.



Goffe directing the defense against the Indians at Hadley. The picture, from an old engraving, is quite as improbable as the event it represents.

Something like forty claimants appeared to urge their rights as the real Louis Charles. Among them was the once celebrated Eleazar Williams. His story was that at the age of thirteen he suddenly found himself living with an Indian family in Western New York. Before that, all was a blank. He and his partisans professed to believe that somehow, while mentally enfeebled from his sufferings, he had been brought to this country. It was stated that the Prince de Joinville, son of Louis Philippe, had an interview with Williams and offered him the dauphin's private inheritance in consideration of his signing a document wherein he would renounce in favor of Louis Philippe all claims to the French throne. Williams was long a missionary to the Indians, and was known as an authority on Indian life. Another claimant went by the name Karl Wilhelm Naundorff. When this man came from Germany to Paris in 1833 to assert his alleged rights, some who had been associated with the court of Louis XVI declared they thought him to be the dauphin. He brought suit for the recovery of the dauphin's property, was thereupon expelled from France and died at Delft, in Holland. Upon his tomb were placed the words: "Louis XVII, roi de France et de Navarre" (Louis XVII, King of France and of Navarre).



The Man in the Iron Mask in his dungeon. From an old print.

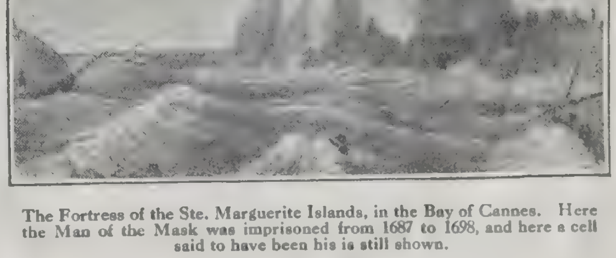
The labors of modern investigators have been hampered by the fact that during the Restoration many of the Temple records were destroyed. It may be said that the death of the dauphin in the Temple cannot be proved on the basis of what is now known, and that the presumption is all against it. Finally, it is obvious both that the spiriting away of the dauphin would have been of advantage to the Comte de Provence, who was next in succession and who later became Louis XVIII; and that the revolutionary party, for its part, would not have been inclined to make much inquiry, inasmuch as it would thus have been relieved of a troublesome responsibility.

When and where did the regicides Goffe and Whalley die, and where were they buried? Whalley and his son-in-law, General Goffe, of Cromwell's army, escaped from England at the Restoration and landed at Boston on July 27, 1660. They lived in strictest seclusion in New Haven, Connecticut, and in Hadley, Massachusetts, and Charles II's government was never able to get them arrested. Whalley, who was the elder, was alive in 1674, but he is thought to have died soon after; Goffe is conjectured to have died about 1679.

The tradition in Hadley was that the two died there and were buried in the minister's cellar. Another legend has it that on September 1, 1675, during King Philip's War, when Hadley folk were assembled in the meetinghouse to observe a fast, the town was attacked by Indians and great confusion followed. Suddenly among the inhabitants appeared a man of venerable appearance and antiquated dress. With evident military skill he marshaled and led the defense, and Hadley was saved. Most of the Hadleyites piously supposed the venerable man to have been an angel; but the angel was William Goffe, who had forsaken his hiding and who immediately vanished. Thus the legend—so often repeated that doubtless many have accepted it as authentic history. All, however, that the historian can say is that the fugitives were guarded faithfully and well; and that their sepulchers, like that of Moses, no man knows unto this day.

Who was "James de la Cloche"? We know what he claimed to be; we know, too, that he was one of the boldest swindlers on record. But exactly who was he? In 1668 he arrived in Rome. With him he carried three documents—two of them professedly written by Charles II of England. These acknowledged James to be a natural son of Charles; and the third purported to have come from Christina of Sweden.

These letters, preserved at Rome, deceived the English historian, Lord Acton, but all were forgeries. The inevitable inference is that James de la Cloche was an impostor. Who was this man, adroit enough to fool many, and even to get himself into reference works as having been what he said?



The Fortress of the Ste. Marguerite Islands, in the Bay of Cannes. Here the Man of the Mask was imprisoned from 1687 to 1698, and here a cell said to have been his is still shown.

Blazing the Tamiami Trail Across Florida

How an Adventurous Motorcade Plunged Through a No-man's Land

By A. H. ANDREWS

This is the first part of a two-part story of the adventures of a motorcade that pioneered its way through the Everglades to blaze the Tamiami Trail. The second part will appear in The Dearborn Independent next week.

Blazing the trail into tracklessCypress where no car or wagon ever crossed before.

Trail Blazers at "Seminole City" on Deep Lake Railway, Lee County.

IN THE southern end of the Florida peninsula—first to be discovered and among the last of the states to be developed—is an area approximately one hundred miles in length and fifty to one hundred miles in width, extending south to Cape Sable, which has been appropriately designated as "the last remaining frontier."

Wild as in the days when the aborigines roamed the entire American continent; bordered on the west by a bewildering maze known as the Ten Thousand Islands which harbor wild bird rookeries and were once the rendezvous of pirates; penetrated on the north and east by the almost impassable muck lands of the Everglades; known only to the Indians and a few native hunters, and never completely traversed except by several adventurous explorers who made the journey afoot; little wonder is it that wild and exaggerated stories have found their way into print from time to time concerning this fertile and much misrepresented section.

Law and order are practically unknown in this "no man's land" which until very recently was some eighty to ninety miles remote from the nearest county seat. Here roam the only American Indians that have never been conquered and subdued by Uncle Sam, being the remnant of the Seminoles who fled to the fastnesses of the Everglades during the Seminole War. They are peaceful and harmless, however, except when under the baneful influence of "wyomee" (whisky). The innumerable islands of the western coast with their many ramifying waterways afford an excellent retreat for moonshiners and bootleggers who industriously ply their calling, unmolested, according to reports from the correspondent to Lee County papers from the little island settlement of Chokoloskee. Excerpts from his recent correspondence are given herewith:

"We expect a lot of moonshine among us soon. One of the teams went up the river last Monday with a load of barrels and sirup, so we think prospects are fairly good."

"We have lots of booze, moonshine and red liquor. Some of the team drunk every day. Yesterday they had a racket and one of our best moonshiners and bootleggers got cut up some and blood flowed very freely, and the ones that were able took him up to Everglade to get his hide patched up so it would not leak so bad."

"We are getting along fine; have plenty of booze and everything. We don't want any sheriffs nor anything. If we need anything it is more booze and more of the devil's disciples to drink it, and bigger knives and more pistols and guns."

So much for the "wild and woolly" nature of the country and the scattering inhabitants along its borders. Now let us call attention to the Tamiami Trail—what it is, the route traversed and what it will mean for the development of extreme South Florida from Tampa on the West Coast, through Bradentown, Sarasota, Punta Gorda, Fort Myers, Estero, Bonita Springs and Naples, to Miami on the eastern shore.

In 1915 Captain J. F. Jaudon, of Miami, conceived the idea of a loop highway across the lower end of the state, connecting Miami with Fort Myers, and thence along the West Coast to Tampa. For some years northern tourists had been motoring to Miami each winter, only to find themselves at the "dead end" of the highway, with no outlet other than the back track over which they came. A similar condition prevailed at lower West Coast points. He reasoned rightly that the connecting up of these two dead ends would not only create a continuous stream of traffic, but would develop and make habitable the intervening lands.

Several preliminary surveys convinced him that the only feasible route lay well to the south of the Everglades and directly westward from Miami, there being less depth of muck and the rock there lying near the surface where it would be easily available for paving purposes. The commissioners of Dade County became interested and a bonding issue was carried for the building of a highway westward across the lower Everglades to the Lee County line. A reciprocal arrangement was effected with Lee County (then having a road graded and partly surfaced south from Fort Myers to Marco) whereby that county was to build a road from a point four miles north of Marco (Marco Junction) running in an easterly direction to connect with the Dade County road at the county line. Because of ultimately connecting Tampa and Miami this road was christened the Tamiami Trail.

Shortly after operations began the United States entered the World War. Work proceeded in Dade County under a great handicap, owing to labor shortage, and in Lee County construction work was suspended altogether, owing to failure of contractor and subcontractor to live up to their agreements, which forced the Lee County commissioners to take over the task.

Then came a proposition from the Chevelier Corporation, owning the two northern tiers of townships in Monroe County, directly south of Lee. This proposition was to the effect that if the Lee County commissioners would divert the Tamiami Trail from its original routing through Southern Lee, running it southeasterly to a point on the Monroe County line, the Chevelier Corporation would meet them there, building the Trail, at their own expense, through their lands in Northern Monroe County, and running due east to connect with the road being built from Miami. As this would relieve Lee County from building more than twenty miles of road, and as finances were already insufficient, the Lee County commissioners gladly accepted, which was acceded to by Dade County. (See accompanying map for original and subsequent routing of the Trail.)

Complications later arose when a wealthy New York advertising man purchased a tremendous area in Southern Lee County—said to be approximately one million acres—and agreed to take over the building of Lee County's portion of the Trail, doing the construction work at actual cost. Naturally enough, he desired to build the Trail along the line of the original survey through his lands in Southern Lee County, but the Dade County commissioners would not accede, as they already had changed from the original plan and were under contract with the Chevelier Corporation.

From all this there originated the Trail Blazing Motorcade which set out from Fort Myers on a Wednesday determined, if it were possible, to reach Miami over the approximate route of the Tamiami Trail; to explore the intervening country, note the obstacles to be encountered, log the distance across and publish the information gleaned on the trip.

There were ten cars that started with the motorcade—nine light-weight machines—eight being of a well-known popular make—and one heavy touring car, a party of twenty-six men from fifteen to sixty-five years and including two Seminole Indian guides who were picked up at the little settlement of Everglade, Little Billie (Cornapatchee) and Abraham Lincoln (Assumhachee). Comparatively few of the party were inured to physical labor.

After picking up four of the party at Estero, which included the writer, a stop was made at Bonita Springs, some twenty-three miles south of Fort Myers. About two miles south of Henderson Creek we arrived at Marco Junction where the main Trail departs from the Marco road, taking a southeasterly direction. Up to this point the country traversed had been sandy pine flatwoods, which here gave way to open sand flats which overflow with salt water during exceptionally high tides, and for some distance the unsurfaced grade proved very heavy to negotiate, being what is termed by the natives "ball bearing sand." The pine timber is again picked up several miles before reaching Royal Palm Hammock, at which point we stopped for dinner, 55.5 miles southeast of Fort Myers.

The Royal Palm is considered the most stately of all palms, having a massive, smooth, granite-colored trunk, resembling concrete in appearance, which in many specimens rises to a height of one hundred feet or more, overtopping the surrounding forest growth and surmounted by a widespreading head of plumy green foliage, resembling in shape a gigantic feather duster. It is strictly tropical, a native of Cuba, but nature in some freakish mood transplanted some of these from their native habitat and some years ago there were discovered two big wild "hammocks" or native jungles of Royal Palms in Southern Lee County.

The best known of these palm hammocks is divided into two sections, it being between the two that the Trail is routed. An effort is being made to incorporate both hammocks into a national park and game preserve, and it is none too soon, for already some of these great monarchs of the tropical jungle have fallen before the axe of a vandal.

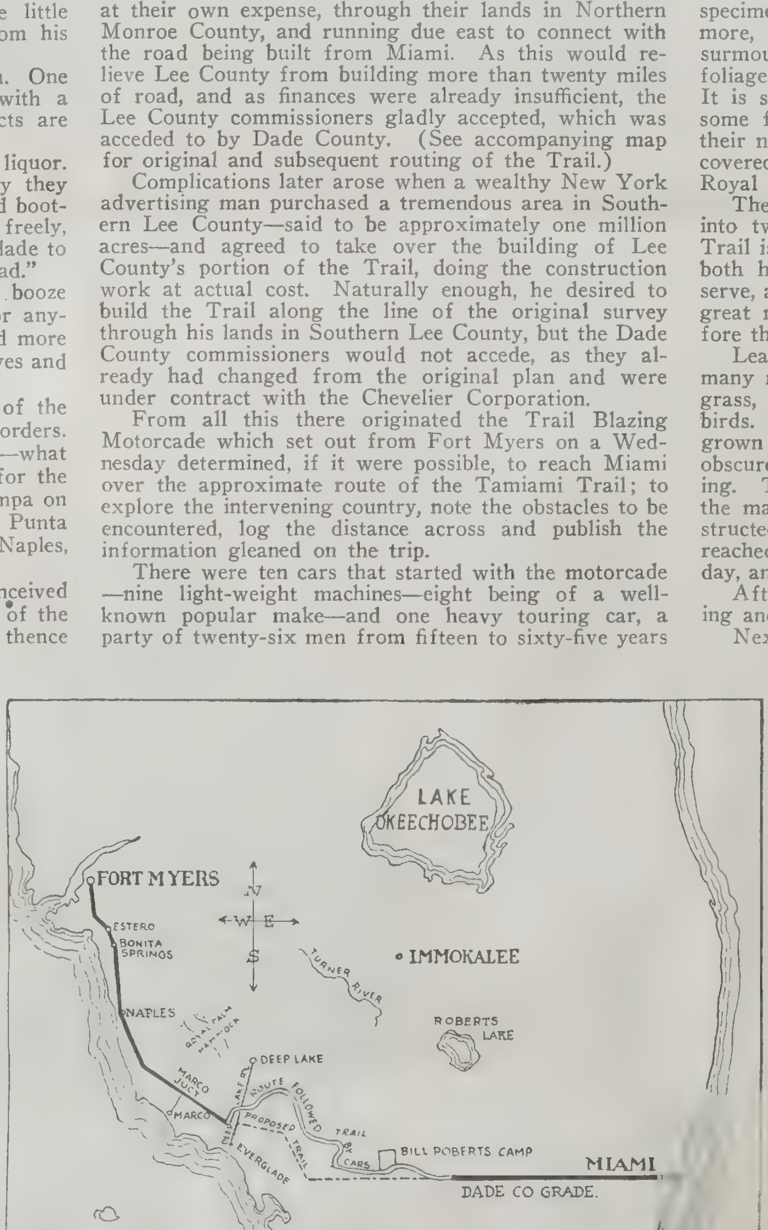
Leaving Royal Palm Hammock, the Trail traverses many miles of open marsh country covered with sawgrass, reeds and lily pads in which are seen aquatic birds. The road grade for long distances is so overgrown with brush and switch grass as frequently to obscure the car ahead from those immediately following. This heavy undergrowth gradually gave way as the marl prairie was reached, affording a fairly unobstructed view of the road for some distance ahead. We reached the end of the Lee County grade late Wednesday, and camp was made for the night.

After supper the hours were whiled away with singing and story-telling around the camp fire.

Next morning a survey was made. We had frequently heard of "the jumping off place," but now we came to a realization of its meaning, for here was the trail's end, as far as construction work had progressed, and ahead lay nearly four miles of salt marshland—a marl prairie of about the consistency of yellow clay, and fully as boggy when wet. About a mile ahead lay the old walking dredge, attempt having been made to move it to a new location, but it had been hopelessly bogged and abandoned. Certainly anything but a promising route for a motorcade to negotiate!

Let us state here that prior to the departure of the motorcade from Fort Myers many predictions had been made by knowing ones to the effect that we would never get through to Miami, but one old resident, Captain G. W. Storter, of Everglade, who probably knows that country as well as any living white man, ventured the opinion that if we could cross this tidal marsh of approximately four miles intervening between the end of the grade and the Deep Lake Railway we would in all probability be able to go through to Miami, as he considered this the crucial test of the entire trip.

In anticipation of this difficulty three scouts had been sent out two weeks previously to investigate conditions. They found the ground at that time fairly firm and so reported. In the meantime, however, there had been several big tides over the marsh that had left it in a decidedly sticky condition. It seemed the best policy, while the



MAP OF TAMIAMI TRAIL.

Our two Indian guides, Little Billie—Indian name, "Cornapatchee"—and "Abraham Lincoln—Indian name, "Assumhachee."

nine cars were still on terra firma (one had gone out of commission and had been abandoned several miles back) to figure out a plan of action and decide upon a feasible route, if possible, before plunging the cars into the mire ahead. A scouting party was organized to cruise a route, while three others, including the writer, essayed the hike to Everglade for further information

The tramp was tedious, and with the grass still dripping from the heavy dew, we were drenched when we reached "Carnestown," a lone warehouse where the surveyed line of the Trail crosses the Deep Lake Railway, this railway being a privately owned project some thirteen miles long that connects the town of Everglade with the big grapefruit grove at Deep Lake to the northward.

No southbound suburban trains appearing, there was no alternative to walking to Everglade, which, by the way, is not in the Everglades but is a little town on a tidewater stream near the coast in Southern Lee County.

Everglade was busy indeed, with dredges, boat ways, sawmill, sirup mill, machine shop, mess hall and bunk houses for the accommodation of several hundred men —quite different from its state on a previous visit—due to the fact that the New York millionaire previously mentioned had a few months before purchased practically all Everglade, the railroad, grove and approximately a million acres in Southern Lee County which he is developing into a vast industrial empire. The land is flat and with slight elevation above sea level, but once given the necessary drainage, will, it is believed, become one of the most fertile spots in all Florida.

Our little scouting party several hours later boarded a waiting car which returned us to Carnestown warehouse. While tramping back across the marsh some activity was noted, and soon it was learned that several cars had already left while others were preparing also to make a mad plunge into what they knew not. No definite route had been selected, each driver choosing the course that looked best to him and going as far as possible before bogging down. It was noted, however, that those who went the farthest were the ones that kept to the tall grass, which when bedded under the wheels served to keep them from miring so badly.

Late afternoon found us with seven cars strung out at wide intervals through the marsh and two still on the end of the grade. Cooking implements and provisions were scattered among the various cars; the ground was too damp to sleep on and the outlook for the night was anything but encouraging. Shortly before sundown a tractor was espied coming to our relief from Everglade. It mattered not whether a car was bogged to the chassis, for when the tractor took hold of it something had to move. When the round-up was completed seven cars stood side by side on fairly firm ground, with very good prospects for getting next day under their own power to Deep Lake Railway, about two miles distant.

The three men with the tractor left us that night for their camp, some five miles distant, for a fresh supply of gas and oil, and where good beds awaited them. One of our party decided to follow them in his car with two companions, but we learned the following day that they ran out of gas and were compelled to walk fully half the distance, reaching the logging camp about 1 a. m. The balance of the party made up bunks around the camp fire and slept as best they could on the damp ground.

After a hasty breakfast our journey was resumed in the direction of the Deep Lake Railway two miles distant, our numbers being increased by two Indian guides, Little Billie (Cornapatchee) and Abe Lincoln (Assumhachee), who had joined us the preceding night. The ground was still very soft, and the pilots not knowing the best route, several cars soon became hopelessly bogged. It was finally decided to have Little Billie ride in the lead car and pick the best going, which proved effective. We arrived at the railroad toward noon at a point designated as "Seminole City."

Some ties were commandeered to bridge the cars over the railroad ditches and we were soon at Lemon Camp just beyond, this being a little wooded "island" in the prairie with a thatched shack where the Indians sometimes camp, and where fairly good water is obtainable.

Gas, oil and provisions had been telephoned for the preceding night and soon arrived from Everglade in abundant quantity, this being the last supply station on the way to Miami. In the meantime one of the two remaining cars had arrived from the rear with the information that the big touring car, weighing 3,200 pounds, had become hopelessly mired and the tractor had also bogged in trying to extricate it. Four, including the writer, volunteered to return to the scene. By dint of much prying and employment of many planks the car was partially raised, but darkness overtook us before further progress could be made.

Monarchs of the tropical jungle. Hundreds of these stately Royal Palms are found growing wild in Royal Palm Hammock, bordering the Tamiami Trail in Lee County.

Returning to camp, we found a railway car awaiting to carry us to Everglade, where the party had preceded us, and we arrived at the hotel, tired, hungry and dirty, and ready for the only shave, bath and comfortable bed on the entire trip until reaching Miami.

The character of the country that lay ahead of us was uncertain, and while the probabilities were that we had sufficient men to push any individual car through almost any marshy place, nevertheless time was an element to be reckoned with, as we were approaching the rainy season when the lands, now dry, would be inundated, making further progress impossible.

Arriving back at the Lemon Camp, a hurried meeting was called in which the owner of the big touring car was told that the party had already been delayed on his account and could no longer wait for him. He had brought the big car against the protests of the motorcade members, simply to advertise this automobile, for which he was agent, claiming that he would put it through anywhere that a light-weight car would go. He had failed in his claims and had delayed the party which had not come to advertise anybody's car, but to promote the Tamiami Trail. Having arranged for another tractor, with men, to extricate his car from the mud and put it back on the grade for the return trip to Fort Myers, we felt that our obligation to him ended there, so preparations were made to break camp right after dinner.

Several miles on across the prairie we found drier and firmer going, passing stands of pine timber en route, and soon came to Abe's camp where he lives with his mother and two sisters. To one unfamiliar with Seminole Indian life and customs a short description of a typical camp might be of interest. A site is selected somewhat more elevated than the surrounding flatwoods whereon are usually built from two to five or six palm-thatched shacks, closely grouped. There are no walls, while filling almost the entire interior of each is a high platform of rough-hewn planks, and upon these platforms the Seminole lives, eats and sleeps, suspending his mosquito bar from the roof. The hogs and chickens occupy the ground beneath, with fleas "ojus" (plenty) in consequence.

TREKKING ACROSS THE MARL PRAIRIES.

A short distance ahead our first real barrier encountered was Turner River Cypress. A dim ox trail winds through it for 3.8 miles, but much fallen timber had to be removed and stumps cut down so that the low axles of the cars would pass over them. Several boggy spots were encountered.

We made camp that night at a little pine island at the edge of the cypress. There being so many men to cook for, the party, for convenience, had been divided into three mess squads. The man in charge of our squad being from Boston, canned beans constituted the chief article of diet—until the grub gave out altogether some days later.

There was one Florida "cracker" boy in our party—a good scout and woodsman who often proved a source of amusement. If there is one thing that the average native likes to do better than another when out in the woods it is to cultivate his vocal powers in yelling, yodeling and imitating all sorts of real and imaginary birds and beasts, so each night Clark was accustomed to stroll out into the forest for a tuning-up spell. On the night in question he gave a very realistic imitation of a wild cat, which caused one of our number, fresh from the haunts of the bulls and bears of New York and having his first experience in the Florida wilds, timidly to inquire: "Say, do you think that was really a wild cat?"

Early Sunday the trip was resumed and under more trying circumstances, as three cars were now out of commission, which necessitated the crowding of twenty-five men, with bedding, provisions and extra gas, into the seven remaining cars, and obviously there were places where the pulling was heavy and many had to get out and walk for a time. Even drinking water had to be carried for miles, occasionally across the dry marl prairies intervening between cypress swamps.

The Seminole Indian is a very reticent individual who tends strictly to his own business and never butts in upon the affairs of others. If you have a speaking acquaintance with him and honestly wish to know his opinion upon a given matter he will tell you the best that he knows, but he never argues or insists. If you ask a question and suggest a possible answer, he will agree with you at once. But let another person suggest a contrary solution to the same question and he will agree with him just as readily, being all things to all men.

For this reason it was found best to leave all consultation with the Indian guides to a member who understands much of their language and whom they trust implicitly. Both Seminole guides were highly intelligent specimens of their race and Little Billie, the elder of the two, has a fair common-school education, being able to read and write.

For some miles Sunday our route lay through rocky country, extending to and beyond the head of Turner River. Although there is a well-defined ox trail through Rockwell Cypress Strand, the road had to be corduroyed more than half the distance with palm leaves, sticks and branches. This was the prettiest cypress of all, containing a rank and varied growth of tropical jungle vegetation and some sizeable timber, also a small lake in the center of the strand. By the time the last car was hauled through to the pine timber all hands were nearly famished and dinner was served.

It was here that Abe warned us to fill our water jugs, as we would find no more drinking water for many miles. The journey was then resumed through long stretches of dry and cracked marl prairie with the hot sun beating down unmercifully upon us. Skillet Camp, the farthest outpost of lower West Coast hunters, was reached about mid-afternoon. We had been told that near by in a clump of palmettoes we would find a cache of canned goods and other provisions that had been left by a recent hunting party, but investigation revealed nothing more than empty water jugs, cans and cooking utensils.

A survey stake of the Tamiami Trail was noted a short distance farther on, but no marks could be discerned upon it. Then followed several miles of dry prairie running—so dry in fact that the dust rose in clouds behind the moving caravan. At a low spot in the prairie the practiced eye of one of our woodsmen detected possibilities for a well, and with a few minutes of vigorous work with a shovel we soon had plenty of drinking water of fair quality. More prairie running and we finally halted about sundown at a little pine island. It was here that the first deer was sighted which bounded off like a flash across the prairie, and as provisions were beginning to run low Little Billie decided to take his gun and go on a foraging expedition. This was the last we saw of him. We learned later that he became lost, not knowing this country, and found his way into an Indian camp some miles distant.

An exceptionally early start was made Monday morning, but our ox trail had faded out. From here on we must blaze a trail through absolutely virgin territory where not even an ox team had penetrated. Our general course had been southeasterly, but now ahead of us a short distance appeared a formidable looking cypress barrier. We had not gone far when a halt was called while Abe skirted the cypress timber for several miles to the southwest looking for the most likely crossing point where the big timber could be avoided as much as possible.

Abe had been through the cypress afoot but it was a different thing to lead a motorcade, where almost every foot of the way must be hewn with axes. At length, after an hour's wait, came the signal to proceed. We were soon at the designated spot and chopping a roadway into the trackless depths of Chatham Bend Cypress, camping for the night in the midst of this cypress, 98.1 miles from Fort Myers.

Manhattan Experiences a Romantic Attack

Walter Hampden, Jane Cowl and Otis Skinner Present Noteworthy Productions

By PETER SCHUYLER

NOTWITHSTANDING the clamor of the press agents, the bellowings of the volunteer defenders of the stage, and the treacly utterances of those who have theatrical fish to fry, Manhattan is this season enjoying the finest succession of stupidities and nastinesses it has had in many years. When one is familiar with what stage imbecilities the past has afforded there is no vital reason for anyone to rush immediately to the nearest railway ticket office and hustle to The Great Shine Way in the search for entertainment. Theatergoers can be swindled just as well at home as in Manhattan and the native highwayman should have first chance at any innocent local pocketbook. Among all the plays which are being shoved at the public from Thirty-fifth to Sixty-third street there are not half a dozen worth any bona fide moron's notice.

Three Merit Attention

THERE have been at least three productions which merited the respectful attention of show patrons. One is the revival of "Cyrano de Bergerac" by Walter Hampden. Another was Jane Cowl's presentation of "Romeo and Juliet." A third, "Sancho Panza," in which Otis Skinner was starred, did not have the required percentage of dirt and being merely an offering of unusualness, interest, and picturesqueness, has been forced to take the long, long trail into other parts which will doubtless receive it with more enthusiasm and intelligence than did Manhattan the Wise.

"Cyrano" has not been seen since it was played by the late Richard Mansfield who did it, as he did everything, with efficient workmanship but without any alarming display of genius. He had the misfortune to play it at a time when it was possible to make comparisons between his characterization of the long-nosed Gascon of Rostand's romantic comedy, and that of the elder Coquelin who played the same rôle with Sarah Bernhardt's company. It was in the nature of a real "farewell tour" that Coquelin made with Mme. Bernhardt because he died soon after he returned to France. To those who saw his wonderful performance with its marvelous death scene Mansfield's interpretation was like a creaking, mechanical doll, and though Mr. Hampden manages very well, his "Cyrano" is a far cry from the genius-illumined portrayal given by the Boulogne baker's son. Indeed it is not to be compared with Hampden's two best rôles, "Hamlet" and "Shylock." Nevertheless it is an achievement of no mean quality and as far as contemporary acting goes, it is head and shoulders above the teacup-and-sugar-bowl histrionics which we are forced to accept from so-called "stars." For it has the characteristics which mark everything Mr. Hampden does; intelligence, sincerity, scholarliness, and fervor. There is no slighting of details, no cheese paring in production.

There is a good assumption of the braggart Gascon in his swashbuckling, his handling of the comedy passages is sound and merry, and his heartbreak at the knowledge that Roxane loves another is theatrically sound. That is the deficiency in his portrayal. It is always theatrical. Even in its best moments it never penetrates the all-essential field of reality. We watch the romantic episodes in which Cyrano is involved, conscious all the time that what we are observing are the interesting actions of a poetic playwright's dramatic phantom, not the sufferings of a real man. Summed up, the weakness of Mr. Hampden's interpretation may be expressed in the comment that, as far as the audience is concerned, one never can forget that Cyrano's long nose is only a very clever piece of the false-face-maker's art. It never grew on a real man's face. It was pasted on with spirit gum. It must not be inferred from what is written herein that the star's presentation is wanting in merit. It just falls short of being a great performance by reason of its inability to convey (to one person at least) the essential characteristic of blood and flesh reality.

Miss Cowl Needs Superlatives

OF MISS COWL'S "Romeo and Juliet" it is not easy to speak without falling into superlatives. Certainly hers is the best Juliet (in fact, the only one) seen in this country in many years. There is a saying that when an actress is old enough to know how to play the part she is too mature and too fat to convey the impression of burning yet virginal youth which is the very essence of Capulet's daughter. Two seasons ago Ethel Barrymore essayed the rôle. The result was almost a pitiful and shocking travesty.

When the announcement was made that Miss Cowl was to play "Juliet" there were loud snorts of derision from that section of the theatrical reviewers which can see no good in anyone who does not belong to their particular stable of favorites. Her opening performance in Manhattan made the wiseacres gasp with astonishment. Here was a Juliet who was actually a young girl. She looked like a girl and the simulation of girlishness was so complete and sustained that the most captious critics were silenced. She read her lines with clear intelligence of their meaning, she was articulate, and she was unaffected. Her rendition of the balcony scene was a thing of beauty. The potion scene was filled with true terror and uncertainty and it was not for a single instant stagy. It was a performance which will not be approached in a long time for sheer loveliness, genuine artistry, and fine acting by any other actress in America. What that initial exhibition contained has now by longer playing been enriched and made more rounded. As it stands, there is no one who loves Shakespeare and real dramatic art who can afford to miss seeing it. For once "Romeo and Juliet" is made (what its author intended it to be) a play, not a target at which ambitious actresses and producers with "new theater" ideas might shoot for personal diversion.

* * *

Sancho Panza Too Clean

MR. SKINNER'S "Sancho Panza" had two insurmountable difficulties to overcome. Thanks to the constant corruption of the tastes and education of theatergoers, and the general disregard which our form of education has created for the literary classics, few know or care anything about "Don Quixote" or Cervantes. So when Mr. Skinner put on a play having for its chief character Sancho, the immortal goatherd, he might have known he had a hard road to travel to make a financial success of the play. The piece is pure romance and purer fantasy. Sancho has always dreamed of being the governor of people and the playwright gives him the opportunity. How he does it, nobly and simply and fairly, in the face of court intrigue, corruption, and personal danger, is picturesquely and entertainingly set forth. All to no avail! Manhattan would have none of Mr. Skinner's wholesome, really delightful characterization. True, there was in the show a Spanish dancer with scant lingerie who performed in the square before the cathedral in Barataria. But she was not naked enough to appease the jaded appetite of Manhattanites, gorged to satiety with the nakedness of the musical shows on The Great Shine Way. She danced with grace and charm and beauty of expressiveness, but she did not wiggle. And without a wiggle Manhattan cannot imagine dancing.

"Intellectuals" to Blame, Too

THERE was a healthy comedy strain, well interpreted by Marion Barney, as a noble duenna of husky proportions, and a scenic production of appeal and vividness. That was not enough. Manhattan demands bedroom situations as the basis of its dramatic fare and "Sancho Panza" had none of that. Something akin to the disgust, heartache, and disillusionment Sancho got as his reward for his attempt to govern properly the people of Barataria must have filled Mr. Skinner's breast as he packed up his play and made off to "the road," where it is to be hoped he will regain some of his faith in the American theatergoer—and also some of the money which has been lavished on the production.

But in assessing the blame for the present noisome condition in the Manhattan theaters, some of the responsibility, at least, must be borne by that section of the play-supporting public which fancies itself "intellectual." This small, but rapidly growing, group must needs have a dramatic fare different from that furnished the great unwashed. To them life (in the showhouse), must be not only a tragedy but it must be tragedy painted black. A happy ending to them is of itself "inartistic," an indication of an "old-fashioned mind," and to be avoided as one would the smallpox. The faintest shadow of Pollyanna cast over a play destroys its value for them. Nothing is worth while except gloom, sordidness, and carefully deodorized dirt. By some process of reasoning (or lack of it) they have determined that only sneers at everything which less self-sufficient mortals consider reputable, are deserving of notice. They bend a worshipful knee before the shrine of that arch faker, G. Bernard Shaw, because, like the Pharisee in the Temple, he is "not as other men." Just how they reach the conclusion that his gibing extremes are more important and true than the extremes of the Glad-Glad Brotherhood and Sisterhood, is an inscrutable mystery, even to themselves. It never would occur to them to doubt, with equal reason, the man who says all life and all living is a malodorous farce as they do anyone who blurbs that existence is a mere matter of blooming rose gardens, butterflies, and warm sunshine. By the mere fact that Pollyanna preaches platitudes, and the red-whiskered Irishman barks cynicisms, one is a monstrosity to be abhorred and the other a god to be worshipped.

One of the favorite diversions of this herd of would-be thinkers is throwing mudballs at the standards of morality recognized as fundamental by the despised remainder of humankind. It must always be remembered that when the word "morality" is noticed by the cult that it means only something that has to do with sex, usually something nasty. The content of that term for them does not hold an idea which has to do with theft, or slander, or false witness. Blasphemy is unheard of since they have abolished God and set up in his place "great thinkers," like Mr. Shaw. Obviously one cannot "address with impious irreverence" a vegetarian Dublin-born deity who lives in England and throws stones, with much profit, at the rest of the world. That is self-evident even to so humorless an individual as a Manhattan "intellectual."

Observe this snort printed in one near-erudite publication, *The Freeman*. Commenting on the play "Tarnish," Harold Kellock closes his review with this beautifully illuminating conclusion:

A Bit of Cheerful News

"LETITIA'S unbending puritanism is understandable in view of her innocence, the distorted values of her environment and her peculiar neural inheritance, but it is distressing to find the author adopting her standards as his own. There are no facts to indicate that young men who have wandered into informal sexual adventures are less fit to become husbands than their sensibly continent brethren. Indeed unprejudiced men and women who have tried the hazardous and delicate experiment of marriage well know that sexual fidelity is one of the minor factors of that problem. It is, as I think Mr. Shaw has pointed out, far easier to live with a person who is something of a libertine, than with one who is something of a drunkard, or something of a murderer, or one who is merely habitually dishonest, unclean or unpleasant. In marriage even minor domestic virtues count more for success than total abstinence from sexual adventuring; such virtues, for instance, as good humor, kindliness, sympathy, and, it must be added, charity. Perhaps the greatest of these is charity."

All this will be cheerful news to the "unprejudiced men and women who have tried the hazardous and delicate experiment of marriage" and who are still blissfully ignorant of Mr. Kellock's colossal discovery that so long as a man is a house angel he may be as great a street devil as he sees fit. So it happens that for the benefit of its "intellectual" readers *The Freeman's* critic has reduced one department of the Ten Commandments to the barber shop level and determined that clean finger nails are the essential major requirement for a happy married life.

Mr. Middleton's Mistake

IN A theatrical trade paper (which should not be mentioned in the same breath as *The Freeman* since it appeals strictly to persons interested only in the dispensing of such trifles as shimmying dolls, second-hand musical instruments, and highly decorative pillow covers to "suckers") George Middleton, author of the playlet, "The Unknown Lady," which was thrown out of Manhattan's prize vaudeville theater because it was considered unfit for the polite varieties, writes with palpable heat that "Immorality is a matter of opinion."

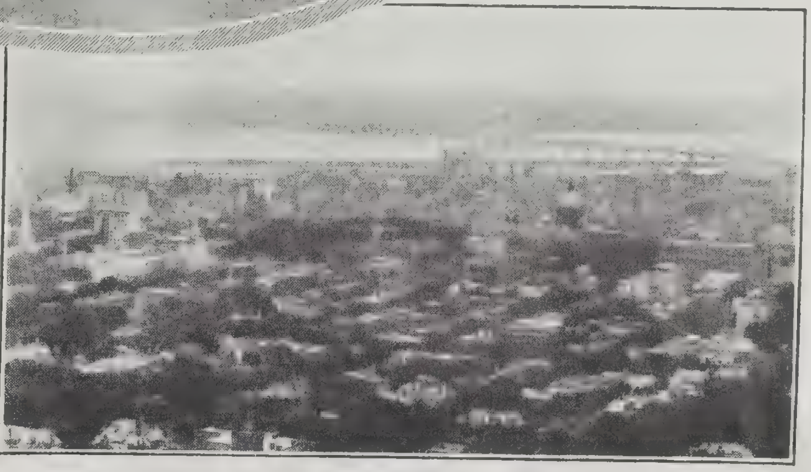
Mr. Middleton is an "intellectual" playwright and when his little play was expunged from the Palace playbill his artistic soul was cut to the quick as it had not been in "twenty years experience in the theater with many plays to my credit." One is inclined to wonder, if one is inclined to think about such nonsense at all, what Mr. Middleton would do if a pickpocket (who also held his theory that immorality was a matter of opinion) put a hand in the Middletonian pocket which held the cash royalties Madame Nazimova paid for the use of "The Unknown Lady," and extracted said royalties. Naturally he could not complain to the police since the pickpocket in his own "opinion" had a perfect right to slip his hand into Mr. Middleton's pocket and remove anything of value he found there. The slightest exercise of the faculty of reasoning should have convinced the angry author that, since morality is a matter of opinion, the owner of the Palace theater had the right to clean his program of "The Unknown Lady" because he was of the opinion that its presence would hurt business.

Not Only Willing to, But Does Put Up With Most Anything From Americans!

Here's an Entertaining Story of What Montreal Goes Through While Its Southern Neighbors Are Spending Ten Million Dollars

By E. L. CHICANOT

Notre Dame Cathedral.



Above—Sherbrooke street, Montreal's Fifth Avenue. Below—A general view of the city of Montreal.

IT IS quiet in Montreal. There's a tranquil, workaday, not to say sober air about the Canadian metropolis. The natives roam the streets in a possessive attitude that is noticeable for its exceeding aggressiveness, which for ex-soldiers is distinctly reminiscent of recaptured French towns in the latter days of 1918. The department stores are slack and New York goods no longer bear the sign "Imported from Europe." The post offices have closed half of their stamp wickets and fifty per cent of the taxi drivers are out of employment. Vendors of moccasins and souvenirs are taking a well-earned rest in Florida or the Bermudas. A born Montrealer can now get within hailing distance of the counter of a liquor commission store and is welcomed at hotels. It is quiet in Montreal. The American nation has gone back to its own side of the border and any danger of a permanent annexation is over for another half year.

As soon as it is reasonably certain that the Canadian spring has arrived, at all times a dubious and uncertain matter, every one in Montreal, French and English, who can manage it, and a great many who cannot, moves out to the Lakeshore or Laurentians, or still more remote and cryptic sections of Quebec, where they are regarded as discoverers and explorers. There ensues a period when the principal streets of the city are almost deserted, woebegone and desolate of appearance, when the chance stranger wonders where the fire is, and the feet of those who must remain to toil echo hollowly in the empty thoroughfares. Then suddenly they are filled up again with another people, of similar colors, sexes, and general physical characteristics but with a much more pronounced attitude of ownership and strangely conversing in what is neither the familiar French nor Canadian brand of English. In a spirit of resignation Montreal subjects itself to the annual seasonal occupation of tourists and conventionists.

Montreal is now firmly established beyond any doubt, successful contradiction or possibility of dislodgement in the life of this continent as its Mecca to which every good American feels he must journey once a year to share in the rites of a convention, unless he be journalist, preacher or secret drinker, when he makes solitary pilgrimage. No individual will gainsay this who has tried to procure a room in a Montreal hotel in the summertime without having registered in the previous autumn and has stood expectant and apprehensive in the tail end of a queue when the clerk was handing out the manicure parlors and bathrooms as sleeping accommodation.

The rise to this eminent degree of popularity has been very rapid, and the movement is strictly confined to quite recent years. The graph of progress reveals an almost perfectly straight line up to about October, 1919, when there is a decided upward trend which has now taken the pencil off the top of the chart. Prior to this period a certain group of adventurers were in the habit of making what was regarded as a decidedly hazardous expedition north of the international boundary each year, upon which they set out only after settling their affairs and making their wills. Since this period, however, the tide of holiday-makers has almost exactly doubled each year as every visitor apparently passed on the glad tidings to his bosom friend and cautioned him to keep it dark. In 1923 the United States census might just as well have been taken in Quebec. The force of the tide may be expected to subside about the time French-Canadians take to speaking English, when the habitant joins a labor union, when the remainder of Quebec's scenery is hidden behind signs advertising the different brands, when it is decided to change the liquor laws, and the League of Nations has made Europe safe for travelers.

Montreal is the continent's convention city. According to the most reliable records the only American conventions which failed to convene in the Canadian metropolis in the summer of 1922 were the Ancient Order for the Suppression of All Languages but American, the Modern Order of Soda Water Manufacturers, the Unorganized and Scattered Order of Bootleggers, and the Jonesville, Iowa, local chapter of the Gasfitters' Union. There were ancient and loyal orders of practically everything and modern orders whose lineage could not be traced back beyond 1919 and whose loyalty is apparently still a matter of doubt. There were societies, political, fraternal and religious, for the promotion of most things, for the suppression of all things, and the merely selfish. There were conventions of every possible profession and business, trade and pursuit—doctors and veterinaries; insurance men and funeral embalmers; policemen and firemen; furnacemen and janitors; masons free and brick; the bar association and the ex-barman's union; moving picture men and picture moving men; bond salesmen and washing machine experts.

Every week there was at least one really big convention, of international moment, upon which the eyes of the continent were centered, with numerous little side ring events. There were so many conventions being held at the one time, in fact, that many a zealous delegate has for days attended the wrong meetings without becoming any the wiser or failing to enjoy them thoroughly. Delegates not so zealous, but with the remnants of a conscience, might often be heard on the final day inquiring on what floor of the hotel the convention was being held. The concluding ceremonies of a week's convention are invariably carried out in gloom and depression though many reckless and enthusiastic spirits dissipate this by immediately joining a society which is to convene in Montreal in the following week.

On the day of a new convention a solid human stream may be seen early in the morning pouring up from the two stations in the direction of the city's hostelries. Arrived in the vicinity of the hotel the crowd automatically splits into two, those who are anxious to secure accommodation right away and those who ask "Where is the nearest place?" Two line-ups immediately result, one outside the hotel register and the other across the road at the government liquor vendor's. When the latter has done its part in swelling the revenue of the Quebec government they move over to the hotel and their places are filled up by those who have been assigned rooms. Committees then meet in private rooms and about fifty per cent may usually be counted on to answer roll call. As the days go on the chairman learns always to look around before saying "we."

An engrossing subject of conversation in hotel lobbies at all times is prohibition and earnest groups found in serious discourse are almost invariably engaged in a reiteration of practically identical views. For it is not a subject which lends itself to debate in Montreal. Argument is impossible from the failure to find an opposition. All visitors seem to belong to the class that "can take it or leave it" and that sees the remedy for its high rate of mortality in a "beer and light wines" policy. Straying Montrealers are rapidly becoming inured to being buttonholed and confidentially informed in thick accents that their province is the last stronghold of liberty on the continent. They are left vaguely wondering where are the supporters of United States prohibition and how it all happened, anyway.

And it is not only the men. Women standing high in the esteem of their home towns, churchgoers and members of the Ladies' Auxiliary, agree that "in Rome, you know." They have their bottle of sauterne quite ostentatiously, imbibe enough to make a canary slightly rocky, wait for the effects with the loveliest thrill, and feel they simply are going the pace.

No one, in fact, seems at all anxious to conceal the fact that he "can take a little now and then without making a hog of myself." From one of Montreal's principal hotels to the nearest liquor store is a block, as blocks go in Montreal. A stroll over this distance any day in the summer between business hours will result in an encounter with from thirty to forty one-hundred-per-cent Americans bearing a rounded, paper-covered package under the arm and a semi-stifled smile upon the countenance. There are some, it is true, keenly jealous of their nation's repute, who feel it encumbent upon them to uphold their country's dignity at all costs in a foreign land, and have the decency to conceal the precious burden as a particularly obese supplement of the Montreal *Star*.

An outstanding feature of every convention in Montreal is a procession of delegates headed by a huge American flag and led by the biggest band procurable, by means of which properly awed natives, who have only observed them in the individual or scattered herds, are given the opportunity of appraising the terrific force of the formidable aggregate of American business men on convention. Varying numbers of middle-aged men, of assorted sizes and shapes, not selected for any outstanding beauty of form or feature, further disfigure themselves in every possible manner just to show others and convince themselves they really are on holiday and they don't care who knows it. All, for instance, may wear straw hats of the Napoleonic period with bright yellow bands imparting the illuminating information "Montreal 1923." Half may be attired in red pants and blue jackets with the other half wearing the garments vice-versa-ed. They may be disguised as sheiks, Turks, toreadors—anything to conceal the dread fact that they are really respectable, married American business men, taxpayers and respected citizens, who smile when their children go to masquerade balls.

No delegate has ever been known to miss the procession, or if one ever did the newspapers were bribed to hush it up. He might pass up every convention meeting but he could never hold his head up in his own country had he failed properly to exhibit the staunchness of its citizenship in the fancy dress parade. In the course of one convention last summer a procession was called suddenly in the middle of one morning without the slightest warning having been given. Some one had blundered and the band was on hand and the mayor waiting patiently to take the salute. Delegates had to be marshaled rapidly from street and lobby, without being given time to disguise themselves, and when the seriousness of the situation was brought home to them they rallied round the flag nobly, swallowing their disappointment and chagrin at being deprived of their regalia and color scheme. Members will tell their posterity of the horrors of that parade, having to march up streets lined with natives clad as ordinary, sober, working citizens. to which further embarrassment was

(Concluded on page 15)

Taking the Paw of the Bear

Forces Favoring British Recognition of Russia Strengthened

By A British Journalist

CAN the government of Britain maintain its present attitude toward the Soviet government of Russia, in the event of pressure from the reinforced ranks of Labor in the British Parliament? The point is of peculiar interest to America, and in the event of the Labor party in Britain being called upon to take up the work of administration—a matter not decided at the time these notes are written—the aspect of the situation presented in the above question assumes a certain quality of immediacy.

Quite apart from the merits of the broad question of the recognition of Russia, it is necessary that the factors behind the new force which has emerged in British politics, and the influences which are practically certain to be brought to bear upon it, should be recognized and given due weight. Observers who have had full opportunity to investigate and gauge the feeling of the Labor electorate in Great Britain on the position as regards Russia find it difficult to avoid the conclusion that in the mass the pressure which that electorate will exert upon its representatives will be definitely in favor not only of recognition but of rapprochement.

In the main, the Labor voter takes the view that if Russia has decided upon a certain system of government, that is Russia's business. While it is true that the Labor party in Britain has repudiated Bolshevism emphatically as far as its aims are concerned, the Laborist generally is prepared with equal emphasis to deny the right of any outside people to lay down the law to a nation as to the form which its government shall take. Further, it is found that throughout the Labor electorate in Britain there is a pronounced disposition to take little account of Russia's war debts and other pre-Soviet obligations, and to rank these as inevitable debris of war and revolution.

The Nearness of Revolt

THIS is not the place for any discussion of those views; but they are important factors in the situation, in view of the status which Labor now holds in British affairs, and are stated for the value which in that connection they hold.

There was a time when the mass of the Labor electorate in Britain lent to "Red" propaganda an interested ear. That propaganda, whether it emanated from Moscow or not, was in direct line with the admitted and applied aims of the rulers of Soviet Russia. It attained proportions which "Red" teachings in America do not appear in any measure to have approached; and of the extent to which revolution in Britain was organized in the year 1921 the full story has never been made known. For example, not only was there the formation of propaganda and fighting units, but there was an issue of badges, which many young men throughout England and Scotland sported with an air of high purpose and of great deeds in the shaping. So far had arrangements for revolutionary outbreak progressed, indeed, that there were issued to the groups throughout the country booklets containing instructions as to procedure.

Those little, red-covered booklets, which might be fitly described as manuals of mob methods, were very carefully and skillfully prepared. They were designed to insure that in the shortest possible time an inflamed mob would be converted into a grimly effective force of destruction; that there would be neither waste of time nor energy on useless objectives in bursts of blind fury; that every outbreak would yield the maximum of advantage in points gained and held, and in material secured for the advancement of the revolution. At the time of the beginning of the great strike among the miners in 1921, the situation in Britain was grave. The sound sense of the British workingman, and a timely check by the calling out of troops—that act did not cow the worker, but made him think, and made him look into the position—saved the day. There has been no such development of "Red" propaganda as that, so far, in America, it would seem.

Aims Obtained Sympathy

WHILE the revolutionary movement in Britain failed, there should be full recognition of the fact that the teachings of the "Red" propagandists did not at all "fall upon stony ground." The methods advocated were rejected, but the aims enunciated by the "Red" agents engendered in many quarters much sympathy, a result not surprising in view of the fact that the propaganda was directed upon a British generation which had been taught to regard Russia as "a land enslaved, a people great, but ground beneath the heel of a merciless and brutal autocracy."

Throughout the mass of the British electorate, at the present time, frank investigators will find not only such a feeling of sympathy for the Soviet régime, but an almost invincible suspicion of the reasons advanced for the non-recognition of the Soviet government. However unpalatable the statement may be in many quarters, it is true nevertheless that large numbers of British Laborites and others are convinced, however mistakenly, that Russia's chief crime in the eyes of official Britain was that it overthrew a monarchy. The suspicion, being there, has to be taken account of. It influences Labor opinion in some parts of the country, and constitutes a factor in the pressure which Labor representatives will be called upon to meet.

The British Labor party has been sent to the House of Commons in strong force on its claim that it can better the condition of the people, and relief of unemployment will be one of its first duties, whether as the party in power or as an aggressive and numerous opposition. It will probably aim definitely, in that connection, at the resumption of trade with Russia. If recognition of the Soviet is the only barrier to renewed trade and increased employment in Britain, Labor will be unable to withstand, even if it were so inclined, the demands of its electorate.

It is to be doubted, however, if there would be any strong disinclination on the part of the Labor leaders to resist in any way the pressure of the constituencies in the direction stated. The writer, from knowledge of the personal views of most of the leading British Laborists with regard to Russia, suggests that to most of them such a demand would be welcome. The trend of things in the British Labor press supports this view. One finds references to the lucrative trade carried on by Britain, especially with Southern Russia, up to the outbreak of the Great War. The productiveness of Southern Russia was a matter in which the British were well instructed, and they had no small part in the trade of that great region. That is a well-remembered fact, as the Labor leaders know. There is some ground for the claim made in Labor circles that in important commercial and industrial quarters there would be no opposition to Labor in an attempt to effect the recognition of, and a rapprochement with, Russia. The Parliamentary representatives of those large interests, it is said, would not of themselves initiate such a move; but, if Labor did it, they would not oppose the action too seriously, and would "wash their hands" of the matter, most benevolently, and get to work to recapture the trade. Russia was a consumer valued in Britain.

The trade was of first importance. The Black Sea provinces of Russia, at the period of normal production broken by the war, were producing 8,000,000 tons of sugar beet annually. Live stock breeding was proceeding on a large and increasing scale. Millions of bushels of wheat and other cereals were exportable every season. The provinces of Southern Russia were yielding more than 100,000 tons of tobacco every year, and out of Caucasia were coming annually nearly 30,000,000 gallons of wine. Tea-planting as an industry was approaching very important proportions along the Black Sea littoral in Transcaucasia, and from the steppes bordering on the Black Sea the yield of black merino sheep had risen to more than 15,000,000 each year. And now comes the most tempting item in the "recognition" bait. Southern Russia, at the time of the World War catastrophe, was producing crude oil at the rate of 12,000,000 tons annually. Of the huge copper deposits, and the manganese industry, which in 1914 was represented by an annual output of 400,000 tons, mention must also be made.

Want Recognition of Russia

STRONG sections of the British electorate other than Labor are known to be only impatiently acquiescent of the official attitude toward the recognition of Russia, and the conditions in Britain fully explain their feeling. Should the Labor party take the initiative in the matter, Parliamentary opposition on the part of the Liberals in particular will be difficult to offer, for the reason that only the soundest of reasons will be accepted by the general body of the electorate for the debarring of a once valued customer. The urge of necessity is paramount in the mass of the people at the present time. They will not be disposed to quibble over matters which stand between them and their bread and butter, as Labor has it in mind to show, I suggest.

The high value which Labor is inclined to place upon its claim that it is best fitted to approach Soviet Russia, that it is best qualified to influence her, that it is the only element in British politics trusted to any extent by her, is in the circumstances significant.

To be able to place on record an achievement which would bring to the general body of the people some amelioration of the suffering brought about by trade failure in Britain, Labor is not in the least likely to neglect the opportunity which lies at the hands of the leaders and is in the forefront of the minds of the Labor electors.

For electioneering purposes, "Levy on Capital" provided a suitable domestic rallying-cry, but the reopening of trade with Russia is in important Labor quarters regarded as one of the most valuable weapons in the Labor armory, for the belief is entertained that not only can it be wielded to bring about relief of unemployment in Britain, but to prove that in the sphere of wider politics the Labor party can successfully exert in the interests of peace and prosperity an influence which is not exceeded by that of any British party. It is felt, further, that in the event of an outstanding success in the foreign field, the Labor party would confirm in its support large numbers of electors who are but temporarily attached, and add many more who have remained Liberal solely through fear that Labor has not yet acquired the wider view in things political.

In the interesting circumstances, of which a brief outline has been given, it may not be too much to expect that, given a Labor administration in Britain, trade interests will at once take an anticipatory glance at the Russian connections which the revolution broke down. As a matter of fact, there are signs that the significance and potentialities of the Labor party as a political force in Britain, in relation to affairs with Russia, have been promptly recognized, and it is undoubtedly the case that as a result of the recent election efforts on the part of important interests to get into touch with Labor leaders have been marked.

No Crowd Without Team, No Team Without Cash

Concluded from page 2

sell the tickets for as much as they can get and turn the money over to the players. You see, coach, the students weren't getting anything out of it for themselves; they were doing it for the players. The players need money."

The ticket scalping system of providing athletes with money is not new or novel. A prominent football official related to us how he arrived at the stadium of an important eastern university that, by the way, always prided itself on the supposed purity of its athletics. The official, detesting crowds, always tried to reach the scene early. On this particular day he saw five or six men selling tickets in front of the main entrance. He had been told that every seat was sold and the scene struck him as odd. Furthermore, the figures looked familiar so he went ahead and investigated. What he discovered was leading members of the football eleven scalping tickets. They were getting anywhere from twenty to thirty dollars a pair.

There are four and twenty ways to hire football players without paying a stipulated amount each week or year for service and every one is wrong. Universities soothe the varsity conscience by inventing some means other than the coarse system of paying players stipulated amounts at stipulated periods for stipulated service. That belongs to the flying wedge period of football. The systems used today are a trifle more delicate.

The "Jack Pot" Helps Out

AT CERTAIN leading universities there has been established a "jack pot." During the football season the graduates who come to town to see the team play contribute to this "jack pot" Since many of these contributors are men of wealth who retain their love for the game, the "jack pot" measures into many thousands of dollars by the end of each football season. This money is deposited as a separate fund and whenever the coaches hear of a desirable player he can have his wants supplied out of the fund. The donor remains anonymous, of course, and no one is directly asked for supplying funds for the player.

There is the trick of getting jobs for desirable boys. One football star went through college "earning" his way by lighting street lamps. Since the town was lighted by electricity and since these electric lights were turned off and on by means of the usual switch, the reader may vividly imagine how hard the football star had to work to earn enough money to make his way through the courses of higher education.

One well-known football player was engaged to look after the town clock. He was to wind it daily. The clock kept good time. It should. It was wound electrically.

At one of the big eastern universities a wealthy broker hired nearly the entire team to clerk in his office. The boys could always be found at his office on Monday. They managed to stay there long enough to draw their salaries.

A few years ago another eastern university had a crack Negro athlete. To help him along a tailor shop was established for him and all the students were asked to send their clothes to his shop. He got so many clothes that he hired several men to do the work. He, like many of his race, had a passion for shooting craps. He would go around the fraternity houses to collect the money due for pressing, cleaning and mending clothes. The fraternity boys would inveigle him into a crap game and win all the money.

When a Minor Triumphs

NOW and then there sweeps across the gridiron a minor college, beating teams of established reputations, causing a general upset of all predictions and making itself nationally discussed. Such a team developed a few years ago. It represented a remote institution and the old heads of the game began sniffing, to speak figuratively of their inquiries. They discovered that one of the stars of this team, a lineman, conducted a grocery store in a small town, 900 miles removed from the university; that he had a wife and two children and that he never missed a day at his store from the last of November until the first day of the following September. This team had an election of captain in December and not half the squad was in college when the time for election arrived. It was necessary to hold a telegraphic vote to decide upon the next season's team leader.

Many competent football players are fitted up with lucrative jobs. A few seriously work at these. Some have the agency for neckwear, hosiery, underwear, and various things that the college student needs. During vacation they are given many opportunities to earn what may be regarded as "big" money. The pay is often so large that they are enabled to hire a capable substitute for a small part of their income and spend the vacation period in having an excellent time. Many of the jobs do not demand any more than drawing a salary.

This practice is not universal. There are many football players who remain untainted but the number appears to be growing smaller each season. Competition is keen and crack material, the kind needed for winning elevens, is not overabundant. The demand for material grows greater and greater annually. If one university will not pay another will and that is that.

The present situation cannot continue much longer. The protests become stronger annually and, sooner or later, there will be a change or the stupendous coliseums that have been and are being dedicated to the great college sport will be left to decay.

Why Montreal Consents to Put Up With Americans

Concluded from page 13

added by the fact that under the right arm of each marcher was a paper package of rounded shape.

The totally erroneous impression may be conveyed that all Americans are prompted to go to Montreal solely out of a disagreement with the laws of their own country. Nothing could be further from the truth. There are indeed others—several of them. They may generally be found straining out of rubberneck busses or percolating out of cathedrals. They hold long and serious discourse with the natives on the stirring history and engrossing romance of old French Canada so as absolutely to dissociate themselves from those for whom French Canada came into existence in 1919. They likewise do their bit in contributing to the country's revenue by dispatching thousands of postcards with the name of the city hall or post office in French, purchasing innumerable pairs of moccasins, volumes of Maria Chapdelaine, and French songs which the French people never by any chance sing.

There is never the slightest danger of confusing either class of tourist, or either sex of both classes, with the natives. The difference lies principally from the knees down. That is why Montrealers walk along with eyes cast down in the summertime and appear to have humpbacks. The hall mark of the tourist is breeches; for what reason has never been clearly explained. Certainly no tourist in Montreal dare leave his hotel otherwise accoutered. There is record of an either daring or sophisticated New Yorker who went out one morning in a business suit, failed entirely to convince the authorities of his purely vacational interest in Quebec, and before the American consul could intervene had been pressed into jury service.

Certainly there is a broad taste and variety in the bifurcated garment as well as a peculiar manner of selection. Tall, rangy men invariably wear the small, tight, schoolboy size which gives them the appearance of dressed fowls. Short, stubby men run to the wide, balloon variety which imparts the impression of their having got into the wrong locker at golf club. In color and texture they vary from what were white duck when they first saw Montreal to the sportiest heathers, with contrasting golf stockings held up with invisible suspenders with startlingly visible tartan tags. Categorizing the combinations worn by women would be utterly impossible, each following her own sweet individual taste and fancy with some weird and wonderful results.

It has never been satisfactorily explained why tourists travel to Montreal in the most expensive and luxurious manner, put up at the best hotels, spend money in a manner that makes the average Canadian worker feel like throwing up the sponge, and yet congregate in the lounge, stroll into the dining room, promenade up the main streets, and do cathedrals and department stores in garbs which would cause their incarceration in their own home towns. Of recent years Montreal has steadily been growing more formal in this respect so that it is almost necessary to don a Tuxedo when visiting the landlord to pay the rent and it still affronts the natives to see a visitor eating a nine-course dinner in a sumptuous dining room in breeches, khaki shirt and sweater. With all their forbearance they do not like to see their city regarded as a combination of golf links and backwoods wilderness.

For the good name of the nation something should be done about it. Not one man in a hundred on the American continent has calves which are publicly presentable, and if they must wear breeches let them hide their shame on the links or pad the members out to shapely proportions. As for the women, a combination of Helen of Troy, Aphrodite, Cleopatra and Atlantic City bathing girl could not make herself becoming in a pair of nondescript knee pants with loose ends, silk stockings, low shoes, a sweater and hair ribbon.

Crossing the border seems to be largely regarded as a sort of lapsing back into the pioneer days of our ancestors—a jaunt into the Never Never Land where bowie knives and forty-fives are appropriate adornments. One gathers the impression that many of these visitors would not be so much surprised as thrilled if a dog team dashed up to the hotel door or a hard-boiled Indian or Eskimo should hold up the dining room and gather in all the finger bowls. Or is it absolute *joie de vivre,* just a perpetual reminder to themselves and an unmistakable notification to others that they are on holidays and letting the old world go on turning without their help for a few weeks. Certain Montrealers, whose forbears were with Maisonneuve when he founded the city in 1642, are curious to know.

Place d'Armes—the center of Montreal.

The engrossing matter of the last day of the visit is the possibility of getting a bottle of it back home. Even the girls "know a man who would do anything for me if I just managed to get a flask through." The men exert to capacity the powers of a long unused imagination, stimulated by the experiences of older travelers, in endeavoring to figure out new places where the inspector is not likely to look. The sorrowful conclusion usually is that the only safe place is the interior, where they immediately proceed to cache it. No wonder they arrive home in the best of spirits, for the best of spirits is in them.

How many American tourists did actually come to Montreal in 1923? The most experienced census takers or range herders could never have determined. It would, from all appearances, have been easier to count those who stayed on their own side of the border during the months of the summer and subtract these from the total of the last census. For months every hotel in the city was filled to capacity, while camping grounds were packed and farmers and small holders made a good little thing out of selling nightly parking space to visiting cars.

Taking the busy month of August, Montreal's largest hotel, which was not in existence in 1922, played the host to some 55,000 foreign guests. The second largest hotel had 4,000 more registrations than in the August of the previous year. The five largest hotels accommodated daily about four thousand persons, and the lesser hotels added about two thousand more. In the course of the season it is estimated that 125,000 American cars visited Montreal, as compared with 63,000 cars in 1922, accounting for a temporary addition to the metropolis' population of some 500,000 souls. On the basis of estimates of other years American visitors to Montreal spent about $50,000 a day there, or something like $10,000,000 during the season.

Let us say a million American visitors in the course of the summer, and err on the conservative side. A million pilgrims leaving behind them ten millions of dollars! What American city has rival claim to Montreal as the continent's Mecca? Who can wonder any longer that Montrealers are willing to put up with almost anything from tourists?

What It Means to Make a Home in the White House

Concluded from page

boxes made to hold her dresses and these she slid under the beds. "Dolly" Madison used a turnstile arrangement left to her by President Jackson, which he had invented to hold his "coats and breeches." Mrs. Roosevelt, with the true housekeeper's instinct, had as many closets added as possible, but even these are inadequate, and were it not for the small dressing rooms, the many frocks and hats necessary for both mistress and visitor often would be sadly crushed for want of proper space.

The extensive improvements made when the mansion was remodeled in 1902 made the entertaining problem much easier, for it included an enlargement of the kitchen, making it adequate to meet the demands of White House hospitality. Prior to this time any elaborate meal had to be cooked at a caterers, carried in large vans to the White House, rewarmed in the kitchen, and then carried a long journey to the East Room where it was necessary to serve large functions, by which time it was, as a rule, hopelessly cold. The kitchen, around which the interest of many housewives revolves, is visible to only a chosen few. It is a tiled room twenty-five feet long and very wide. On one side fifteen feet of the length is taken up by the great range with its shut-in hood and various large warming racks. Down the center is a long table, with smaller tables at each end; here it is that the three cooks and three helpers work. There is an astonishing array of more than 800 cooking utensils, including every variety of pots and pans in ordinary use and old-fashioned ones as well, even to preserving kettles and bean pots. Mrs. Taft added many electric time-savers, none of which are more helpful than the silver cleaner; before it was a very laborious undertaking to clean the more than 1,200 pieces of silver belonging to the White House.

Most housewives would feel overwhelmed at the "dishes and glassware" which the mistress of the White House has at her command. There are nine sets of china. Most of the Presidents' wives since Lincoln's time have added to the stock, but of course a great number of pieces of each set have been mutilated. The Lincoln set has a rich crimson border with an eagle in the center. That ordered by Mrs. Grant has a wide buttercup-yellow border and plain center, except some of the pieces which are flowered with a Dresden effect. The Hayes china has game and fish decorations. There are only a few plates and after-dinner cups and saucers left of the real Dresden of the Arthur Administration. The ivory, gold and turquoise Haviland china bought by Mrs. Cleveland has but a few pieces left. Mrs. Harrison was a connoisseur of china and the service she added is believed to be one of the most beautiful of the Executive Mansion china. There are forty-four stars in a blue border, enriched with a wreath of Indian corn in gilt upon the edge, with the eagle and United States coat of arms in colors in the center. The McKinley china is of a miscellaneous character. The Roosevelt is extremely simple in white and gold with the National emblem on each piece. That added by the second Mrs. Wilson is much like it in appearance. This set is the only one "made in America." All china is marked "President's House." The cut-glass pieces have the arms of the United States engraved in an inconspicuous manner upon them. The silver, too, is marked. Uncle Sam is very particular about the fineness of the linen he provides and each piece is exquisitely worked in white with the monogram "U. S." Some of the satin damask cloths are ten and twelve yards long.

Besides her duties as a homemaker, Mrs. Coolidge has many social duties which call for all the tact and grace she has at her command. Uncle Sam, however, has provided many ways to assist her in the planning and execution of her entertainments. When she is the nation's hostess she is entitled to the services of a detail of young officers who act as ushers at the official levees. In command of this social staff is a master of ceremonies, the same Colonel of Engineers who exercises a mechanical supervision over the house equipment and appointments. The Marine Band discourses whatever music she selects. All decorations are provided by Uncle Sam who appropriated for the present fiscal year $18,000 for the care, repair and maintenance of the greenhouses of the Executive Mansion. The greenhouses were formerly attached to the house and many of the First Ladies have spent their time in them, cultivating some special flower or plant. They were, however, removed when the White House was enlarged. It is the first duty of the officials in charge of them to see that the President's House is supplied daily with cut flowers and that the floral decorations for the state occasions are the best that can be produced. The day of the "floral design" for a long time held sway at White House functions, and we read where one First Lady decorated the table with a "swinging garden of Babylon" which was four feet high with a succession of little terraces. Now it is rather the artistic arrangement of a few sprays placed wherever it is possible to make them effective.

There are indeed many duties to the nation which must be fulfilled by the mistresses of the White House, requiring time and strength, but with them all they have ever made of it a home. There have been the same cares and anxieties and problems as in the humblest home in the country. And when one sees a light in a certain room upstairs it is not hard to picture the mistress of the "President's House" sitting by the table talking over the affairs of the day with the home circle.

Dr. Mercer's "Tools of the Nation Builder"

Concluded from page

tinuous collection of later implements. High up in the main court hangs a codfish dory. To one side of it is a whaleboat, and on another wall is a dugout canoe. The tools used by the American pioneer in agriculture are classified into tools for the culture of seeds, including the shovel, hoe, fork, drill and rake, plow, harrow, roller, clover huller, described by Pliny as having been used by the Romans, which is the original of the modern reaping machine. "The hand-turned grain fans," says Dr. Mercer, "first without screens, introduced into Britain from the East via Holland about 1715, were developed here about 1815. They are still lingering in later factory-made forms. But the winnowing van, ancestor of them all, is gone. Historic associations, misty with age, hang about this shovel-shaped basket, the van or fan of Old England, the vannus of the Romans, used to shake chaff from grain in the time of Christ, and as here shown so employed by our own ancestors until about 1800.

"The sickle is still more important. With its serrated edge it continued to cut grain grasped by the handful from Bible times until the nineteenth century, when it suddenly gave way to the grain cradle and reaping machine. Many of the tools here exhibited are, like the flail, of unknown antiquity. Others have been in use like the sickle since the days of Moses, or like the quern, since Samson ground in prison. How shall we estimate the momentous change early in the nineteenth century which suddenly swept them away? For two thousand years and more man did without the telegraph, telephone, steam engine, trolley and airship, but not without the shovel, hoe, rake, sickle and plow. Modern machinery has masked many of these antique implements, but here they are, hand and home made as our ancestors still used them a hundred years ago.

"The museum attempts to illustrate human history by means of tools, and every object here shown may be said to be a tool. Tools are made of animal, vegetable and mineral materials, and as these must first be obtained in the raw states, and then fashioned by one or more intermediate processes, it follows that tools make tools and that many may be called secondary, because they are made by one or more others, more or less fundamental, which may be called primary. Archeology tells us that during the prehistoric period man made or edged his tools with stone, and later with the mixture of copper and tin called bronze, and that he had no knowledge of iron until the dawn of history. Fashioned for all purposes, hardened to cut everything, including itself, iron has become the master of all processes, and maker of all tools. It follows that as this museum concerns itself only with the historic period, all the tools here shown are either obtained in the first place, or shaped or mounted or edged with iron."

BRIEFLY TOLD

The unpaid interest on the debts of Europe to the United States amounts to more than $1,500,000,000.

By means of a metal pistol it is possible to cover iron or steel articles with an extremely thin but very strong layer of aluminum, zinc, copper, lead or other metal.

Landlords of Paris are prohibited from raising the rents to more than 100 per cent over the figures obtaining in 1914, according to a recent bill passed in the French parliament.

The Shaker village on Lake Macomy at Enfield, New Hampshire, is for sale. Seven white-haired survivors of the original colony have moved to Canterbury and settled under the leadership of another dwindling community of Shaker folk. The correct name of the Shakers is "The United Society of True Believers in Christ's Second Appearance." The name "Shaker" was derived from a peculiar ceremonial dance in which the dancers shake their shoulders.

At eighty-one years, the Rev. M. S. Anderson, a pioneer of the Columbia River Methodist Conference, has accepted appointment to the charges at Wayside and Wildrose.

The Australian Federal Government is offering leases consisting of fifty-seven blocks of 1,000 acres each, for cotton growers. The leases are rent-free for the life of the tenant or for twenty-one years from the commencement of the lease.

Dancers in the Yukon are said to be tripping the light fantastic to radio music from New York.

Mabel Normand films are barred in many movie houses. Inasmuch as their production antedates the scandal causing the ban, the atonement must be a vicarious one on the part of her employers.

At the centennial celebration of the Cache Valley at Logan, Utah, in July, Mrs. Hahn, of Kansas City, Kansas, granddaughter of Jim Bridger, noted pioneer scout and guide in the region at its settlement, will be the guest of honor. Mrs. Hahn came into prominence recently by filing suit for a million dollars against producers of the film "The Covered Wagon," for depicting Bridger as an undesirable character, it is alleged

Fifty-six and one-half per cent of cargo moved through the Panama Canal last year was in United States ships.

The famous church of St. Jude, London, has been abandoned because of the Jewish influx in Whitechapel. "We are like Englishmen in a foreign land, little isolated colonies in the midst of an alien race," said the rector.

In a speech to British cinema makers, the Prince of Wales remarked that "the Chinese had motion pictures of a sort 3,000 years ago."

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Pages in the United States Senate are between twelve and sixteen years of age, and are paid $2.50 a day during the session with a bonus of $20 a month.

Cats which stray beyond their own thresholds in Berlin must be muzzled.

Snow was hauled 288 miles from Thendora, New York, to Briarcliff Manor, New York, to surface the slide and jump of the American Olympic ski team.

Among one of the first sanitary acts passed in America was a quarantine act in Massachusetts in the year 1648.

A New York architect has invented an automatic apparatus which switches on an electric light, sounds an alarm and turns on oxygen for a person accidentally locked in a bank vault.

Commerce between Mexico and the United States amounts to more than $20,000,000 a month.

The highest European waterfall is that of the Staubbach, in Switzerland. It is nearly 900 feet high.

The death rate of the United States steadily declines. Registration which now includes eighty-five per cent of the entire population shows deaths last year to have been only 11.8 per 1,000.

In Moscow University eighty per cent of the medical students are Communist Jews. Admission is reserved for boys and girls of approved atheist and Bolshevist principles.

The whale is disappearing off the Pacific Coast. The total catch in four months was 377.

Firminy, France, population about 20,000, has an Unhappy Married Men's Club. Nearly 200 men, ranging in age from twenty-five to seventy-five, are members.

Only immigrants of an "intellectual capacity superior to the American average" and of higher physical standard than most aliens who have been admitted, should be allowed to enter this country, the committee on selective immigration urge in a report.

More than sixty-three per cent of all the telephones in the world are in the United States.

A factory on the bleak northwest coast of Australia will convert into soup and other table delicacies the thousands of turtles that swarm the beaches there.

Convicts in British Columbia penitentiaries are prohibited to labor for private companies, according to a new ruling.

A very prominent American, writing from abroad, says: "Even from England about one-third of the emigrants are Jews. From Russia ninety per cent to ninety-five per cent of persons going to America are Jews. At least sixty per cent of the emigrants from Poland are Jews. Many influential Americans over here think that there is a world-wide scheme to flood the U. S. A. with Jews."

Dope users number 7,500 in Chicago alone. Sixty per cent of the women tried in morals court of that city are drug users.

Street car fares in Paris, France, cost six sous —three times the charge of in pre-war days.

The Yellow River, "China's Sorrow," has been dammed by an American engineering corporation. Millions of persons have been drowned by the river's floods and it has changed its course many times in centuries past. The land formerly under water will be reclaimed and power may be developed at the dam.

New Year's Day in Japan tests the financial strength of every individual from the lowly rickshaw man to the largest commercial concern. On that day all outstanding debts are settled.

There are 48,531 millionaires living in France.

The secondary streets of Moscow are deserted; grass grows between the cobblestones; tramways run half empty and most of the shops and restaurants are closed.

A GOOD INVESTMENT FOR NINETEEN TWENTY-FOUR

During 1923 nearly 600,000 men and women invested the sum of $1.50 in a subscription to THE DEARBORN INDEPENDENT—more than 65,000 sent in subscriptions during December alone.

These figures indicate in some measure the extent of the confidence placed in this publication and the manner in which it is carrying out the purposes for which it was intended. Invite your friends' and neighbors' attention to THE DEARBORN INDEPENDENT and the many articles of unusual interest which it prints.

Urge them to subscribe—they will never regret the investment.

Any Ford dealer will gladly accept subscriptions or they may be mailed direct, using the accompanying subscription blank.

CHRONICLER OF THE NEGLECTED TRUTH

Frenchman Is Losing Faith in His Government

Once Believed All Told Him, But Now It's a Different Story

By SAMUEL CROWTHER

> Americans returning from Europe express intense disgust at American newspaper handling of the foreign situation. "Feature stuff" has superseded facts. Mr. Crowther went to Europe, not to hear what the rulers wanted to have printed as propaganda in America, but what the situation actually is and how the plain people are reacting to it. His observations are presented in a series of articles for THE DEARBORN INDEPENDENT, beginning with this issue.

"WE GO to war, we fight, we win, we get nothing. We have nothing to say about it. We shall go to war again. Again we shall have nothing to say about it."

He shrugged his shoulders and went on about his work. He was the manager of a not unimportant jewelry shop on the Rue de la Paix. We should say that he had a good job, although he neither drew the pay nor had the standing of a man in a similar capacity in the United States. But he was nearer the employing class than the working class. He thought himself intelligent enough at least to have a voice in government and he was complaining, not against war, but against a republic in which a citizen had no say. I found many others talking much as he was talking.

Take another, a peasant owning a tiny farm—just a plot of ground a few hundred feet square. We should not call it a farm. But to him those few square rods of earth are the world. There are thousands more like him—so many in fact that it is next to impossible to lay out a golf links in France. On every inch of his ground he raises vegetables in rows so close together that he could not use a wheel hoe—even if he had ever heard of one. Besides that land he has only one other interest—his hoard of money.

Tourist Doesn't See Through

HE HAS been in the war and his wife has worked the land and added to the store of money, so he has no particular objection to war—for it has not interfered with those things in which he is most interested. He took for granted that every man must serve his time in the army, and then in the reserve, and at some time would go forth to war. That had always been a part of life—his father had been to war and so had his grandfather and indeed all his male relatives. War was like the weather—one had to take it as it came. Also he neither knew nor cared about government; that was no concern of his. But now he had a concern:

"When I go to buy anything the price is too high and I must go without or stop saving. I must save or else my daughter will have nothing to marry on. I go without and I save. But what do I save? There is no gold, there is no silver, there is only paper money. That money is no good; every day I see by the exchange that it is worth a little less. What is it I save? What is it that is wrong?"

The tourist in France does not get much of an idea of what is going on. He sees only the tourist department of the Republic and the persons who are employed therein. They expect to amuse him and to take his money—and they do both. He kicks about the prices being high but he expected them to be high and only when something is too raw does he start a row—and gets his trouble for his pains. He eagerly watches the exchange rate; few Americans have had much experience with fluctuating exchanges, so following the exchange is a new game. The women take to it as they do to bargain hunting; the odd centimes loom large. On a day when the franc was falling, one woman spent four hours in a branch of an American bank waiting to get the high rate of the day. As a result of her four hours she made twenty cents and she went off hopelessly happy—for of course she counted only the centimes she had earned per dollar and never thought to translate her winnings into American money. With the Americans the falling franc is just a game. Also it does not much bother the caterers to the tourist—for they quickly adjust prices with a little margin over for good luck. But away from Paris, back in the country where the savings are, the falling franc is a tragedy. And it is shaking the very foundations of France.

France is a land of small incomes. Scarcely more than half a million persons have incomes exceeding 6,000 francs—at the rate of exchange only $400 a year—and fewer than 700 persons have incomes of $38,000 a year or more. Six thousand francs was a satisfactory income before the war, but now it will buy only what, perhaps, two thousand francs would then. And this buying power is lessening.

Only Few Care About Politics

ONLY a few Frenchmen care much about politics. The boulevardiers talk politics incessantly, but when the time comes to do anything they have so exhausted themselves with talk that they have little energy for action. They mostly follow parties in which personal leadership is more important than policies. The peasant takes no interest at all in politics. It has more than once been suggested that laws be passed making it an offense not to vote. Politics is a matter of leaders—much more so than in our own country. These leaders have parties and they have followers and, as long as they continue to make the noises which their followers are accustomed to hear, they may remain in office. The party leaders form a sort of club; the members oppose one another on nearly all questions and sometimes the opposition is not only sincere but violent, but no party coming into power hogs everything. A little is always left over for the opposition—not perhaps through any love of the opposition but because it is better to have an opposition that one knows than to have one that one does not know and which might play the game on new lines.

So it is that the government of France is in the hands of a comparatively small number of professional politicians and an army of bureaucrats. The latter draw small salaries, but make up for that by being satisfactorily important to themselves. They are extremely useful in keeping party lines intact. The parties are further kept in line by the newspapers. Every politician of importance has a newspaper. So has every large interest. These sheets are not newspapers to our way of thinking. They are small, they carry few advertisements, and they rarely have the money or the desire to gather and print news. They print long, haranguing editorials and a few odds and ends of news. For the rest they are filled with dramatic, musical, or literary criticism and stories to entertain the reader. The editorial staffs are provincial to the last degree.

They know nothing at all of the United States; they commonly believe that our citizens are interested solely in money, that money rules all of our actions, and therefore the country is governed directly from the source of money—that is, Wall Street. For this reason they pay great homage to visiting bankers or to anyone connected with or appertaining to large sums of money.

The government is in the control of a group which has ideas and schemes directed to the benefit of a small section of wealthy men. These plans are not disclosed to the people nor to the outside world. On the contrary every act is being represented as for the benefit of the people; their rightful fears and hopes are being played on by Premier Poincaré and his associates. The people are told with masterly eloquence to stand by the flag and not to betray their fellow citizens who are with the colors on foreign soil. The old war cries are in full force. But behind this cover is another set of schemes in which the people have no part.

Why They're in the Ruhr

THE government is in the Ruhr for a number of legitimate reasons and a large army is being maintained for a number of legitimate reasons. The French Army is the sole defense of the Western World against Soviet Russia; the Russians have played their game and they have lost. They are as savage and as predatory as the ancient Huns and they would be scourging Europe in an instant were it not for the French trained and maintained Polish army backed up by the great French forces. These people have seen so much of Bolshevists that they take it that a good Bolshevist is a dead Bolshevist.

And again it must not be forgotten how much France suffered in the war; much of the sympathy offered by Americans and especially by the professional "Friends of France" is mushy and harmful. Far too many Americans make a living by offering sympathy and far too many Frenchmen make a living by taking it. The thing has been overdone. But the plain fact remains that the census of 1921 showed France to have only 36.084 206 persons—a decline of two and a third millions in ten years. Many French statisticians think that in fifty years France will be down to thirty millions—and that Germany will be up to ninety millions. In addition to all the direct losses of war, France lost through the Germans her chief industrial centers. It was about as though Western Pennsylvania and Ohio were suddenly laid waste.

About ninety per cent of the devastated regions have been repaired out of internal loans and through reparations in kind from Germany. But the interest on the loans is a charge of four billion francs a year. France has very real burdens and troubles and they cannot be dismissed by talking of French militarism and all that sort of thing. It is very easy to overlook the facts in taking a stand either against or for France. As far as we are concerned in America the emotional aspects are of no consequence, but the facts are of considerable consequence, for they do affect us.

The ordinary Frenchman is losing faith in his government—he is not saying much but he is beginning to think that perhaps the politicians are not quite, what they represent themselves to be. Once upon a time he thought Germany was going to make good all of the war losses and the pension account and everything. Clemenceau and others promised that. Now he is certain that Germany is not going to pay much and he puts the blame on the politicians—he thinks the whole affair has been somehow muddled. He is willing to support the Ruhr occupation so long as it promises to yield money, but he is not hopeful and out in the country he displays less interest in reparations than we do in America. But if Poincaré does not bring back the bacon his finish is in sight. For that will be sure proof that the French politicians have been outwitted by the Germans and the English.

If the Ruhr try fails, the French citizen is nearly ready to put down the reparations account as a bad debt. But he does insist upon security against Germany.

The Germans have in the course of history invaded French soil something like fifty-two times; the French are perfectly certain that another invasion is only a question of time. They do not, as a rule, care anything about destroying Germany. I have found less animosity against Germany among the French working people than among the Americans living in France. The Americans have to take this attitude, for the people suspect the United States of somehow being at the bottom of the whole mess. An American with money is welcome as long as he spends it. But in this the American is not alone; the English are even less popular than the Americans and the nationals of no country are really popular in France, for there is a distinct feeling that everyone is against France

The present French Government represents, not the people, but a small group of wealthy men who are looking for industrial power. This government has demonstrated that it can put down strikes. The group behind it are now pressing for the reduction of wages and the lengthening of working hours. It has turned most of the workers into Bolshevists—which is not important as long as the government has the backing of the peasants, for France is not primarily an industrial country.

Industrial Group Reactionary

THE group of industrialists who control the government think in terms of thirty years ago—our most backward manufacturer would be considered by them as a dangerous progressive. Poincaré as a lawyer, has represented them for years. This group sent France into the Ruhr to satisfy the public demand for security and for reparations, and under cover of this move is trying to effect some very large operations for their own private gain.

The present French policy, if it fails, may result in serious disturbance at home; if it succeeds it will surely result in serious disturbance among the other nations of Europe. To grasp what is really going on one must line up the ostensible purposes with the concealed purposes—separate the sheep from the goats.

Until now France has not wanted to agree upon any figure for the German indemnity. The French diplomats know perfectly well that the largest sums which they have claimed are beyond the possibility of payment. That is the reason why they suggested them; they did not want a settlement of money until certain other plans had matured. Now they will accept money because the only possibility of stabilizing the franc is through an arrangement with Germany, for the French peasant insists that the drop in the franc must be halted.

The politicians a few months ago were saying:

"We cannot distinguish between the indemnity and the future security of France."

Now they are saying:

"Let us first settle the money matters and then talk about security."

Just after the Armistice, when the treaty was drawn by Premier Lloyd George and President Wilson by which Great Britain and the United States guaranteed France against attack from without, the French were willing to accept a treaty as full security. Since then other plans have been formed and it is doubtful if the French would today accept any treaty guaranty. My conversations convince me they would not. Their reasons are partly political and partly economic, with the economic factors controlling.

Stone-Age Ideas Rule

IT IS the settled belief in France that the prosperity of the country depends solely upon what it exports. There is absolutely no idea that the home market of France can be enlarged. The government experts will tell you exactly what is the consumption in France for every important staple. We in America know that consumption depends upon price; our prosperity has been built upon this idea. The most familiar example is the automobile. Twenty years ago it was settled by our own experts that the automobile was a rich man's toy. It was the main affair of the manufacturer to change styles of automobiles so that they would go out of fashion as quickly as women's dresses. The rich man was expected to buy a new car not because his old one was worn out, but because it was no longer in the mode. Then came the cheap automobile and soon the automobile was a necessity.

French manufacturers cannot conceive of such a situation as has been brought about in America, even though Citroen has since the war managed to make a cheap little car which pays a low tax and uses little gasoline. He has in consequence sold cars to French people who, according to the statistics, could not possibly be in the car-buying class. The very idea of the French automobile taxes is an illustration of the unsoundness of the theories. They have a horse-power tax and various other taxes on the running of the car and on gasoline, which make it all but impossible for the man corresponding to the American who would own a three or four thousand-dollar car to own a car at all. In addition they have a high duty on foreign cars. The immediate consequence was that only the very wealthy people could own the high-powered cars which had prevailed, and foreign cars practically went off the

The Virile Story of Saint Brigid's Parish

Encroachments of Ghetto Vanquished

By CHARLES ALBERT COLLMAN

The church of St. Brigid's. Tomkins Square, New York, and Reverend Philip J. Magrath, Rector of St. Brigid's.

WITH its tall twin steeples tapering to slender points, and the golden cross glowing between them on the apex of its roof, the old church of St. Brigid stands on guard at Eighth street and Avenue "B," in the heart of New York City's famous East Side. It faces westward across the ten-acre expanse of Tompkins Square, a city park named after a one-time governor of the Empire State, whose term of office expired more than one hundred years ago. This edifice, whose virile history has been bound up intimately with the life of this part of the city for the last three-quarters of a century, has just celebrated its Diamond Jubilee under circumstances so unusual that they can scarcely be paralleled by any parish in New York.

Tompkins Square was noted, many years ago, as the scene of the city's large military parades. From the early "forties" to the end of the first decade of the present century, it was a busy but quiet neighborhood of modest homes of a law-abiding population which has played its important part in the development of the metropolis. Many of its people worked in or about the great drydocks then in existence on the East River, or in the gas houses toward Twelfth street, for the park is situated between the Gashouse District on the north, and the Great Ghetto which then lay far below it toward the south.

Seventy-five years ago, when there was no adequate church for the English-speaking Catholics in this section of the East Side, the Reverend Father Richard Kein first collected the people of the locality in a little chapel in East Fourth street. Eventually he purchased the property on Avenue "B" and founded the parish of St. Brigid's. The church was begun in 1848 and finished within three years. Its erection was regarded at the time as an immense undertaking, the magnitude of which may be realized when one remembers that then Ireland had just passed through the terrible famine of 1847 and was convulsed by the throes of revolution, and that the calls on the charity of the Catholics of New York were constant and pressing. Later a rectory was built on the avenue, and a school was opened on Eighth street beside the church building.

Father Mooney, successor to Father Kein, opened the school in 1856. He secured the Brothers of the Christian Schools to take care of the boys' department, and invited the Daughters of St. Vincent, now known as the Sisters of Charity, to take charge of the girls. During the sixty-six years of life of St. Brigid's school, 41.000 boys and girls studied within its walls. Its one-time pupils are today found in every honorable walk of life, in the senate of the state, in all branches of the civil service, in the professions and in the commercial world.

In 1861, during the War of the Rebellion, Father Mooney went to the front as chaplain of the noted 69th Regiment of New York. Upon his return he conceived the idea of frescoing, painting and otherwise enhancing the beauty of the interior of the church. The edifice itself, in its vast proportions, the symmetry of its architecture, in the size and adornment of its altar, was a great step in advance of many of the earlier churches, which were substantial but plain. A great organ was built, which was unequaled by any in the city at the time for the sweetness of its tone. A magnificent set of stations, painted by a celebrated French artist, was imported, and vestments for the use of the altar were made by the Cloistered Sisters in France.

Father Mooney labored for almost a quarter of a century for the people of St. Brigid's. The parish was a large one, including some 10,000 souls, and extending from Fourth to Twelfth street, and from First avenue to the East River, taking in Houston and Mangin streets. Later, old St. Brigid's church and school flourished for many years under the guiding hand of Monsignor Patrick F. McSweeny, and reached its height in numbers and prosperity.

Then suddenly this section of the city was stricken by one of the worst calamities that has ever visited New York, the destruction by fire of the excursion steamer *General Slocum* at North Brother Island. This excursion was an annual affair, arranged for the residents in the vicinity of Tompkins Square, and participated in by hundreds of Protestants and Catholics, young and old, who invariably looked forward to it with anticipations of delight. It was in June, 1904, that this calamity befell the *General Slocum,* after it had proceeded several miles up East River, and was entering Long Island Sound. Probably more than 900 lives were lost, mostly women and children.

This appalling death loss fell entirely upon the Tompkins Square district. Many families were totally destroyed, not a survivor remaining, while the desolated homes of others displayed as many as seven to eight streamers of crape hanging from their doors. Entire streets were in mourning, and the numerous deaths of children were emphasized by the rows of empty benches in the schools.

Many survivors, to overcome the poignancy of their grief, removed to remote sections. Tompkins Square became a desolated region, with hundreds of unoccupied homes. The once so proudly flourishing parish of St. Brigid's gradually fell into decay, owing to the constantly diminishing congregation and the shrinking of its revenues.

Those who remained in the district were then oppressed by another misfortune. The Great Ghetto of the lower East Side, which was being fed constantly by fresh streams of immigrants arriving by the thousands from Russia and Poland, began to stretch its shadow northward. The unoccupied houses in Tompkins Square were suddenly filled to overflowing with a strange and alien race of people, uncouth, unfriendly in demeanor, with unpleasant habits of life, and speaking a barbarous jargon. Flaring Yiddish hieroglyphs appeared on shop windows. Uncleanliness prevailed in the streets, where a dark-skinned multitude swarmed. All that had been built up there by busy Christian hands for a generation, fell away. Industries perished, and shopkeepers abruptly lost their trade. Resident families were driven to flight, and the whole complexion of the neighborhood changed.

Year by year since then, the influx of peoples from Eastern Europe has been doubling and trebling. The families of the Yiddish population are herded together in indescribable confusion. The streets at times are almost impassable, and no other race can survive the living and trading methods that prevail there. Showy shops are filled with goods of doubtful origin, and are offered at prices that preclude competition.

The old St. Brigid's school, with its historic bell suspended between the second and third stories, housed fewer and fewer pupils. The drydocks passed away, and the vast majority of the people of the parish removed to the Greenpoint section of Brooklyn. The gray stone walls of old St. Brigid's church still rose above the square thronged with its alien multitudes, but those who, in passing, noticed the neglected condition of the ancient structure, and its slim attendance, often wondered how long it would survive, and when it too would pass away with the parishioners who had once thronged its doors.

At this period, over on the North River front in West street, a priest, known popularly as "Fighting" Father Magrath, had been making a name for himself through the work he was doing on behalf of the seamen frequenting the waterside. For years he had been conducting the Catholic Seamen's Mission, located between Perry and West Eleventh streets. This is not a home or lodging house, but a place where sailors while in port can gather of an evening and idle away a few hours over pool and billiard tables, at game and reading tables, or write letters to their folk across the sea. It is their mail address in the port of New York, where thousands of letters are received yearly for them and carefully guarded until they are called for. Father Magrath visited the men when they were ill aboard their ships, and saw to it that they received proper medical care and attention. He managed Monday night concerts at the mission, which were attended by 500 or 600 seamen. He had shown his strong influence in protecting them from beach combers, gangsters and others along the waterside who rob and waylay the sailor-man.

It was this militant priest who was now appointed to the pastorate of St. Brigid's, and it immediately became his ambition to save the church from further decline and restore the parish to its former prominence as a Christian center in the heart of the East Side. He at once set to work with feeble material resources, but unbounded mental and physical energy. He found that the school attendance, once so large, had shrunk to 110 pupils, and that on the average only 350 persons were attending Mass on Sunday, and the revenue therefrom had declined to no more than sixty dollars a Sunday.

"The clouds looked black," said Father Magrath, as he recounted his experiences to me, "but I always look for the silver lining. My experiences in mission work on the river front have taught me a lot. I sized up my limited resources, and got to know the values of things, and the material needs of the parish. I talked the matter over with some of my parishioners. They were dubious and seemed all at sea how our plans for renovating the old church could be accomplished. But I've never believed in failure. I said, 'I'll do a little, you do a little, and you also do a little, and we'll get there.'

"The interior and exterior of our famous old church were in bad condition. There wasn't any doubt about it. It was the same with the rectory and the school. There hadn't been any renovation to speak of for nearly thirty years. The once beautiful frescoes in the church were falling off the walls, due to a leaking roof, and the paint on walls and ceiling was fading from sight. Here and there, and very noticeably, other interior decorations were crumbling away. In the school the gas fixtures were in a bad way, and the ceiling actually threatened to fall down. We changed the lighting to electricity. I went to work myself, with the help of two young men of the parish, who had some of the things necessary. I also got hold of some metal of an old pattern at a very low cost, and we put in a metallized ceiling, hammering it in with six-inch nails. In this way we renovated four rooms at the expenditure of little money. So we had well-lighted classrooms again, and no fear of the ceiling falling down. We also built workshops and new rest rooms in an old tenement at the back of the church.

"The inside of the rectory needed a coat of paint pretty badly, and this I also attended to myself." Father Magrath's face assumed its customarily broad smile. "Many a time I answered the doorbell in overalls, and a paint brush in my hand, to confuse a visitor when I said, 'I am the priest.'

"A year ago it dawned on me that the Diamond Jubilee of the dedication of the parish was approaching, and I made up my mind there'd be a celebration, either large or small. I hunted up some of the old-time Brigidians, scattered here and there throughout the city, and got them interested in the subject, asking them to interest others. Among them were some long-headed men of sound judgment, like Rogan, Greene, Malone, Quirk, Yanser and Ward. We had a preliminary meeting here at the rectory, and some were pessimistic, others optimistic. In the end the proposal was warmly received, as you could see by the fact that each of them gave an initial donation, the sum total being $600.

"But the first grand rally of the Brigidians was held last April in the 'Old School Hall.' There were 460 of them present. I urged them to aid us in the celebration of our famous old church. I showed them the present conditions in the parish, and drew for their benefit a mental picture of their young days when St. Brigid's was the envy of the neighboring parishes. One month later we had another rally. Other rallies were held. In all, between $12,000 and $13,000 was raised. Every seat in the body of the church, which numbers eighty pews, five sets a pew, has been sold, likewise the first row of seats around the gallery. The church has been painted inside and out. Our grand old organ has been overhauled, and electric fixtures have taken the place of the original massive gas fixtures.

At the Diamond Jubilee celebration, Archbishop Hayes was present with seventy-two priests, and the sermon was preached by Monsignor Michael J. Lavelle. What had at first seemed merely an ambitious dream has become a reality, and the apparently new St. Brigid's is but the old St. Brigid's restored.

Currency Contraction Cause of the Dark Ages

Breakdown of the Framework of Society Coincident With Money Shrinkage

By JOHN BASIL BARNHILL

SIR ARCHIBALD ALISON, a conservative of conservatives, in his "History of Europe." claims that the suffering produced in England by the contraction of the currency, after the Napoleonic wars, was greater than had been occasioned by all the earthquakes, wars, pestilences, and famines she had ever endured. He goes further and boldly proclaims a philosophy of history based on an analysis of the evils of an unregulated currency which cannot be ignored with impunity: for every recurring panic adds fresh confirmation to the doctrine so cogently advanced. Sir Archibald Alison writes as follows:

"The two greatest events that have occurred in the history of mankind have been brought about directly by a contraction, and, on the other hand, an expansion, of the circulating medium of society. The fall of the Roman Empire, so long ascribed in ignorance to slavery, egotism, and moral corruption, was in reality brought about by a decline in the silver and gold mines of Spain and Greece. And as if Providence had intended to reveal in the clearest manner the influence of this mighty agent on human affairs, the resurrection of mankind from the ruin which those causes had produced was owing to a directly opposite set of agencies being put in operation. Columbus led the way in the career of renovation: when he spread his sails across the Atlantic, he bore mankind and its fortunes in his bark. The annual supply of the precious metals for the use of the globe was tripled; before a century had expired the prices of every species of produce were quadrupled. *The weight of debt and taxes insensibly wore off under the influence of that prodigious increase.*

Metallic Money of Roman Empire

"IN THE renovation of industry the relations of society were changed, the weight of feudalism cast off, the rights of man established. Among the many concurring causes which conspired to bring about this mighty consummation, the most important, though hitherto the least observed, was the discovery of the gold and silver mines of Mexico and Peru. If the circulating medium of the globe had remained stationary, or declining, as it was from 1815 to 1849, from the effects of the South American revolution and from English legislation, the necessary result would have been that it would have been altogether inadequate to the wants of man, and not only would industry have been everywhere cramped but the price of produce would have fallen universally and constantly. Money would have become more valuable every day; all other articles measured in money less so; *debt and taxes would have been increasing constantly in weight and oppression. The fate which crushed Rome and has all but crushed Great Britain would have been that of the whole family of mankind.* All these evils have been entirely obviated, and the opposite set of blessings introduced by the opening of the great treasures of nature in California and Australia."

Confirmation of the philosophy of history proclaimed by Sir Archibald Alison is found in the Report of the Monetary Commission of 1876 which said:

"At the beginning of the Christian Era the metallic money of the Roman Empire amounted to $1,800,000,000. By the end of the fifteenth century it had shrunk to less than $200,000.000. . . . Population dwindled, and commerce, arts, wealth, and freedom disappeared. The people were reduced by poverty and misery to the most degraded condition of serfdom and slavery. The conditions of life were so hard that individual selfishness was the only thing consistent with the instinct of self-preservation. All public spirit, all generous emotions, all the noble aspirations of man shrivelled and disappeared as the volume of money shrank and as prices fell.

"History records no such disastrous transition as that from the Roman Empire to the Dark Ages. This entire breaking down of the framework of society was certainly coincident with a shrinkage in the volume of money, which was also without historical parallel. The crumbling of institutions kept even pace and step with the shrinkage in the stock of money and the falling of prices. All attendant circumstances other than these last have occurred in other historical periods unaccompanied and unfollowed by any such mighty disasters. It is a suggestive coincidence that the first glimmer of light came only with the invention of bills of exchange and paper substitutes through which the scanty stock of the precious metals was increased in efficiency.

"Nothing less than the energizing influence of Potosi and all the argosies of treasure from the New World were needed to arouse the Old World from its comatose state, to quicken the torpid limbs of industry, and to plume the leaden wings of commerce. It needed the heroic treatment of rising prices to enable society to reunite its shattered links, to shake off the shackles of feudalism, to relight and uplift the almost extinguished torch of civilization. That the disasters of the Dark Ages were caused by decreasing money and falling prices, and that the recovery therefrom and the comparative prosperity which followed the discovery of America were due to an increasing supply of the precious metals and rising prices, will not seem surprising or unreasonable when the noble functions of money are considered. Money is the great instrument of industry, the protoplasm of civilization, and is as essential to its existence as oxygen to animal life. Without money civilization would not have had a beginning; with a diminishing supply it must languish and, unless relieved, finally perish."

Man could as easily exist in a vacuum as society can exist without an ample circulating medium. The utterly demoralizing effect wrought by the most distressful of all vacuums—a money famine—was eloquently portrayed by Senator W. M. Stewart, in his speech at St. Louis, in November, 1889. He stated:

"The quantity of money having been, as we have seen, determined for the past three thousand years by the supply of the precious metals, the prosperity or adversity of the world has been governed by the abundance or the deficiency in the supply of those metals. Whenever the mines failed, history informs us that the world was plunged into barbarism. When Rome rose to greatness by conquest, she persistently gathered to herself the treasures of the civilized world. She continued to accumulate gold and silver. The price of property rose. The whole Empire was inspired by increasing values during several centuries, until the time of Augustus, when Rome reached the zenith of her power. It is estimated that she had then accumulated and put in circulation from eighteen hundred to two thousand millions of money, consisting of gold and silver. Besides this, she had vast accumulations of plate and ornaments. Then came internal dissensions. Mining ceased, the Empire was rent in twain, broken up in fragments, invaded. Money was borrowed and lost and Rome grew poorer and poorer until the end of the seventh century, when she had lost the great majority of her circulating medium. The civilization of the world was practically destroyed. In seven hundred years property and debts grew, while the ability to pay continually became less. No man had any courage in those days. No man could assert freedom or independence. Why? Because, I tell you, there is nothing like scarcity of money, poverty, inability to pay debts or support a family, to make men cowards . . . . A nation, like an individual, deprived of money, will submit to degradation and shame. Would it have been possible to reduce the proud Romans to feudal slavery if they had continued rich? When men make money by receiving fair compensation for their products, they become independent and free . . . . The creation of the great middle class in England, brought about by the discovery of gold and silver in Mexico and South America, is the source to which the great Anglo-Saxon race may trace its dominance in the world. The money from the New World was the vitalizing force which created an independent spirit throughout Europe and caused a reformation in politics as well as in religion. It is a sad reflection that the farmers of our own country today, in consequence of the money kings, and the gold monometallists, are losing that independence of character for which they have been noted. Their mortgages are making them cowards. There is nothing which so quickly makes a man a coward as a mortgage on his farm, which he cannot pay."

Paper Currency Contrivance of Jews

THE ancient peoples had no paper currency. Even bills of exchange were unknown. These were a contrivance of the Jews, in the Middle Ages, to transport their wealth in a convenient form, when threatened with persecution, from one country to another. Gold, silver, and copper coins constituted the sole circulating medium of the ancients. When they were withdrawn there was nothing to supply their place. Disasters of every kind accumulated. Credit was violently shaken; prices fell to a ruinous degree; industry could obtain no remuneration; the influence of realized capital became irresistible and the only efficient power left in the state was that of the emperor who wrenched his taxes out of the impoverished hands of his subjects, or of the creditors and landlords who, by legal process, exacted their debts from their debtors and drove them to desperation. This was exactly the state of the Empire in its declining days; this was the beginning of the end; this progressive drying-up of the lifeblood of the social system, the contraction of the currency, produced its logical and inevitable result in the Dark Ages.

William Jacob presents the following table which shows the contraction, from abrasion alone, of the currency of the Roman Empire:

TABLE SHOWING THE CONTRACTION OF THE CURRENCY IN THE ROMAN EMPIRE, FROM ABRASION ALONE, FROM 14 A. D. TO 806 A. D. IN ENGLISH POUNDS.

14 A. D.	358,000 000	410 A. D.	107,435,924
50 A. D.	322.200,000	446 A. D.	96 692,332
86 A. D.	287,980,000	482 A. D.	87,033,099
122 A. D.	259,182 000	518 A. D.	78,229,700
158 A. D.	233,263,800	554 A. D.	70,406 730
194 A. D.	209,937,420	590 A. D.	63 364.057
230 A. D.	181,943,678	626 A. D.	57,027,652
266 A. D.	163,749.311	662 A. D.	51 324,887
302 A. D.	147,374,380	698 A. D.	46,182.399
338 A. D.	132,636 942	734 A. D.	41,573,160
374 A. D.	119,373,248	770 A. D.	37,415,840
806 A. D.	33,674,256		

While the circulating medium, in the eight centuries, was all but wiped out—less than one-tenth of it remaining—statistics touching population are extremely vague. High authority states that the total population of Alexander's empire and of Rome at her greatest extension was less than the present population of the United States. In all Europe there were but forty million in 500 A. D., seventy million in 1500 A. D. and 170 million in the year 1800.

Other causes conspired still further to contract the currency of the Roman Empire, which consisted exclusively of gold, silver and copper coins. When the invasions of the barbarians began the universal and well-founded terror produced a general hoarding of the precious metals, which entirely withdrew from circulation till the danger was over. This reduced to almost nothing the money price of every species of industry and proportionately augmented the weight of public and private debts. "In the reign of Justinian," says Gibbon, "a rapid decrease was felt in the forced and circulating capitals which constituted the national wealth. His revenues, in consequence, were not equal to his expenses. Every art was tried to extort from the people their gold and silver; and fathers were sometimes compelled to prostitute their daughters to appease the collectors. Justinian lived with the reputation of a hidden treasure; but he bequeathed to his successor only the payment of his debts."

Speculators Control Currency

THE employment in modern times of checks and paper money has in a measure liberated commerce from the fatal limitations of a metallic money system. But as long as the control of the currency remains in the hand of speculators, as it does today, it can be made an instrument of greater evil than was ever known under the metallic system. Its very elasticity, in the hands of the speculators, can be turned into a monster, devouring the fruits of industry on every hand. The Federal Reserve System, (its true name, as indicated by its operation, would be the Private Preserve for Speculative Bankers) still religiously adheres to the position taken by James H. Eckels, Controller of the Currency under Cleveland, who said: "We bankers do not propose to let business have the money necessary to carry on till we first get our rake-off." That rake-off, according to John Skelton Williams, Controller of the Currency under Wilson, reaches staggering figures: "The sworn reports show that during the period from October, 1919, to August 1, 1920, there were made by the national banks in New York City more than 4,000 loans, at rates of fifteen, twenty, twenty-five and thirty per cent, a year, and that the amount of these loans, including only a portion of those made during this period at the above rates in three of the largest banks, aggregated more than six hundred million dollars." But while there was plenty of money to loan for purely speculative purposes, there was a "deflation" of the farmers and legitimate business of the country which one business man declared was "worse than ten panics." Mr. Williams, late Controller of the Currency, further says: "The national banks in New York City were given, in proportion to their total loans and discounts, three times as great an amount of reserve bank funds as our 7,699 'country' banks were allowed to get in their hour of need. If our 'country' banks had been given by the Reserve banks the same proportion of accommodation that was furnished to New York banks, sometimes in blocks of 'forty or fifty million dollars' at a time, as Governor Harding expresses it, and to use his language again, *'instanter,'* those 'country' banks would have received, for the use of the farmers, cattle raisers, industries and business of the country, a thousand million dollars more than was accorded them. The official figures prove that the total amount of loans or credits extended by the twelve Federal Reserve banks amounted, in May, 1920. to $2.938,000,000 and by August, 1921, the total had been 'deflated' to the tune of $1,411,000 000. The official figures show that the 'deflation' in their holdings of 'bills discounted and purchased' by the twelve Federal Reserve banks between October 22, 1920, when the farmers and business men were pleading piteously for help or consideration, to November, 1921, was $1,784,000 000 an actual contraction from $3,050,000.000 in October, 1920, to $1,266 000,000 in December, 1921. From October, 1921, there was a wicked contraction practically every month—a steady, cruel, grinding calling in of loans and credits accompanied by unparalleled losses, failures, suicides and ruin."

With the power to contract our currency given the Federal Reserve Board, this board has the power to produce in a few months a greater amount of misery than Rome created in centuries.

In the modest but eloquent final chapter of his "History of Money in Ancient Times" Alexander Del Mar writes as follows:

"The author cannot part with his reader without disclaiming any pride of opinion on this recondite subject. That which has engaged the attention without harmonizing the convictions of such master minds as Aristotle, Plato, Tycho, Brahe, Copernicus, Locke, Smith, Mill, and Spencer is surely a study which no man can afford to approach with rashness nor leave with complacency.

"WHEN THE PRINCIPLES WHICH UNDERLIE IT ARE THOROUGHLY UNDERSTOOD, MONEY IS, PERHAPS, THE MIGHTIEST ENGINE TO WHICH MAN CAN LEND HIS GUIDANCE. UNHEARD, UNFELT, ALMOST UNSEEN, IT HAS THE POWER SO TO DISTRIBUTE THE BURDENS, GRATIFICATIONS, AND OPPORTUNITIES OF LIFE THAT EACH INDIVIDUAL SHALL ENJOY THAT SHARE OF THEM TO WHICH HIS MERITS ENTITLE HIM, OR TO DISPENSE THEM WITH SO PARTIAL A HAND AS TO VIOLATE EVERY PRINCIPLE OF JUSTICE AND PERPETUATE A SUCCESSION OF SOCIAL SLAVERIES TO THE END OF TIME."

This emphasized paragraph should be engraved on the inner walls of every financial institution.

Lincoln's Freeport Speech Sounded Knell of Slavery

A Huge Granite Boulder Marks an Event as Important as the Landing of the Pilgrims

By FRED L. HOLMES

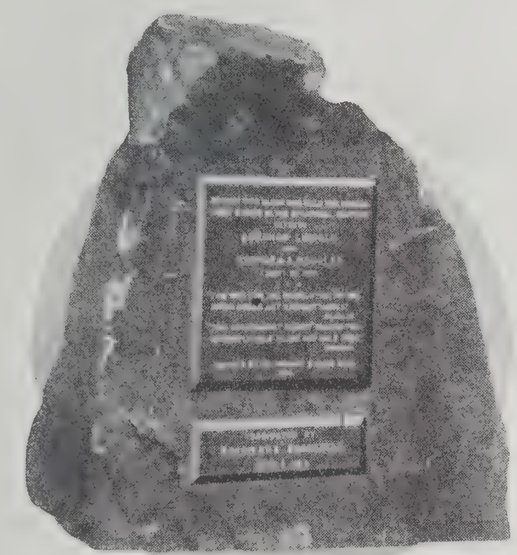
CROWDING a sidewalk corner of one of the back streets in Freeport, Illinois, there stands a huge brown granite boulder that marks an event of historic importance comparable with the Landing of the Pilgrims at Plymouth Rock in 1620. Both are monuments to liberty.

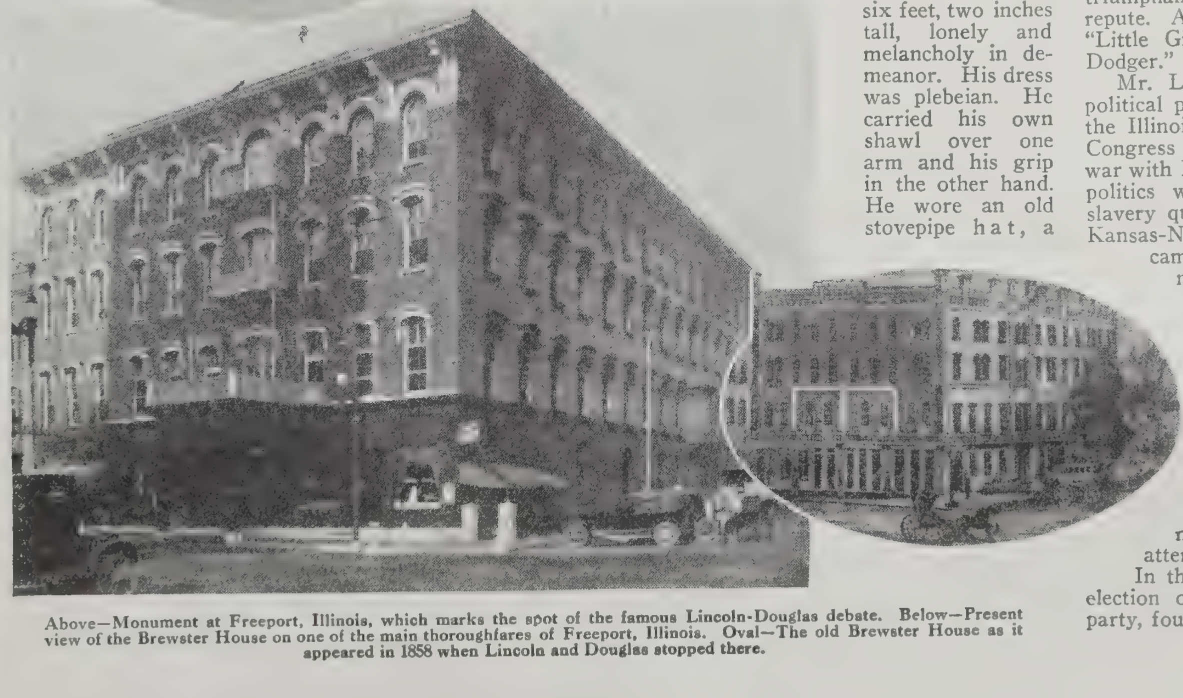
Just as the thousands go annually to Massachusetts to crowd about Plymouth Rock, where the first white settlers dedicated its bleak shores to economic freedom, so other thousands come to Freeport, and with bowed, uncovered heads, stand before the rough-hewn cenotaph to pay reverence to the courage and nobility of the spirit of Abraham Lincoln. Freeport, then an ugly country hamlet, now a thriving commercial city of 20,000 population, is a mountain peak in his career.

The nation's history has not forgotten this landmark. Of the seven joint debates between Lincoln and Stephen A. Douglas over the slavery issue, the one at Freeport, August 27, 1858, marked an epoch. From that day the question of Negro servitude became a moral as well as a political issue; out of that occasion spread the fame of the sagacity of Abraham Lincoln, resulting in his election to the Presidency and the consequences of Civil War.

"The fate of the nation was decided in Freeport that day," declared the historians. Yet of those who heard the debate none save Lincoln seemed cognizant of its momentous consequences. It sounded the knell of a united Democratic party on the slavery issue. It lighted the smouldering fires of discontent, blending all factions for liberty into a single camp.

As the decades have passed, weaving the story of the Emancipation Proclamation that freed 4,000,000 Negro slaves and the adoption of a constitutional amendment to extend freedom to all races, the tangled skein of circumstances lead back to the Freeport debate. So it transpired that twenty years ago a President paused in his arduous duties to journey to Freeport and dedicate a monument on the hallowed spot which blazons a turning point in American history.





Above—Monument at Freeport, Illinois, which marks the spot of the famous Lincoln-Douglas debate. Below—Present view of the Brewster House on one of the main thoroughfares of Freeport, Illinois. Oval—The old Brewster House as it appeared in 1858 when Lincoln and Douglas stopped there.

"Today we commemorate the spot on which occurred one of these memorable scenes, in accordance with which the whole history of a nation is molded," declared President Theodore Roosevelt, dedicating the Lincoln-Douglas monument at Freeport, June 3, 1903. "Here was sounded the keynote of the struggle which, after convulsing the nation, made it united and free."

More than half a century has passed since the memorable debate. Only a few of the persons who heard it are still living. Within the past ten years, several have told me the events of that day. But it was not until I journeyed to Freeport, one afternoon in the autumn, stood before the landmark and watched the interest and reverence of passers, that I became deeply imbued with the spirit of a day sixty-five years before, when 15,000 persons gathered in chilling winds to witness one of the greatest intellectual wrestling matches in history.

Freeport's citizens and school children are no longer dull to the significance of the event. The youths of the streets direct one to the spot and tell of the contest, as if it were a happening of yesterday.

"Just off the main street, two blocks to the left—not far from the depot," was the direction of a little girl probably in high school. "And the Brewster Hotel, where Mr. Lincoln stayed, is near by. You can't miss it," she added.

For popular enthusiasm and civic awakening, the Lincoln-Douglas debates were a political revival. Two theories of government—one of compromise and the other of freedom—clutched in deadly combat.

Equally picturesque was the contrast between the contestants. One was scholarly, suave, ambitious, subtle in argument, adroit in making statements intended to create prejudice. The other was awkward, a face sad, sharp-featured and unprepossessing, homely, direct in his speech, logical in argument, and animated with a terrible frankness of purpose that made his influence on an audience magnetic.

Douglas was dressed like a cavalier—ruffled shirt, dark blue coat, light trousers and shiny shoes. He was short of stature—barely five feet, two inches—thickset, deep-chested, and burly. His general appearance was prosperous. Lincoln was plain, slightly stoop-shouldered, six feet, two inches tall, lonely and melancholy in demeanor. His dress was plebeian. He carried his own shawl over one arm and his grip in the other hand. He wore an old stovepipe hat, a coarse, faded coat, short in the sleeves, trousers that bagged at the knee, and rough boots.

The statue of Abraham Lincoln on the campus of the University of Wisconsin was designed by Adolph A. Weinman, and is a replica of the one at Lincoln's birthplace at Hodgenville, Kentucky.

By CHARLES R. VAN HISE,

Late President, University of Wisconsin.

It cannot be doubted that the bronze face of Abraham Lincoln will modify the spiritual faces of the students of the university who are to view daily the sad, calm, sagacious, determined and rugged face of our great President of the Civil War. What this Lincoln statue will do in the way of developing nobility of character and sustained courage to carry forward the fight for the advancement of the people of this country, no one can foretell; but that it will be perpetually one of the great and high educational forces of the university, no man may doubt. From it, during the centuries to come, many hundreds of thousands of students will gain at least a reflection of the spirit of service to their country that animated Abraham Lincoln. They will persist to the end in the great fight for right and equal justice to all, even as did this man of sorrow. The spirit will pass in some measure to the millions with whom they come in contact, and gradually the widening influence for good of the Lincoln statue will extend throughout the world.

Senator Douglas was boastful of his New England ancestry. He was born in Vermont in 1813, attended an academy, started West in 1833, studied law in Cleveland, was a state's attorney of Illinois in 1835, member of the legislature the following year, secretary of state, supreme court judge, member of Congress and was first elected United States Senator from Illinois in 1847. He had the reputation of being a successful lawyer, a triumphant politician and a debater of national repute. Among his political followers he was the "Little Giant"; among his enemies, the "Little Dodger."

Mr. Lincoln was just coming into national political prominence. He had been a member of the Illinois legislature from 1834 to 1840 and in Congress from 1846 to 1848. He had opposed war with Mexico and had temporarily retired from politics when the compromise issues over the slavery question arose. In 1854, aroused by the Kansas-Nebraska law, he plunged into the Whig campaign, and when the Illinois legislature met, lacked but four votes of being sent to the Senate. His reputation was local. Farmers greeted one another with, "Have you heard Abe's last?" To them he was the "ox-driver," or "rail-splitter."

Meantime, issues were developing which were to match Lincoln and Douglas in the most memorable debates in history. Civil strife had broken out over the admission of Kansas. Northerners were trying to make Kansas free and Southerners were attempting to make it a slave state.

In the midst of the turmoil, the Presidential election of 1856 intervened and the Republican party, founded in 1854, placed its first Presidential

(Concluded on page 15)

"Sporting" Manhattan Fears for Its "Sport"

Why the Scum of Our Alien Isle Shivers for Safety of "Boxing"

By PETER SCHUYLER

FRANKIE JEROME is dead and the heart of sporting Manhattan is sad. He was twenty-five years old, a veteran of the World War, and one of the best known bantamweights in the East. His courage killed him because he did not know what the word "quit" meant. Injuries he received in a "boxing contest" with another bantamweight sent him to the hospital where he died thirty-six hours after the referee had stopped the bout to save him from further punishment. The medical examiner said he died of intermeningeal hemorrhage caused by the rupture of one of the veins between the surface of the brain and the lining of the skull. He had a host of friends and a legion of admirers, all because of the quality which is most admired by men, gameness.

But "sporting" Manhattan is not grief-stricken because Frankie Jerome is dead. Not much! "Sporting" Manhattan is paralyzed with grief because Jerome's death has speeded the movement to kill the boxing "graft" in the city and the state. "It's too bad about Frankie and tough on his mother but them things 'll happen," growls "sporting" Manhattan out of the corner of its mouth. "The hard part of it is the sport is going to be killed and that ain't right."

The possible repeal of the Walker Law, which permits "boxing contests" to be given in New York State and decisions to be rendered, constitutes the element of tragedy in the death of Frankie Jerome, as far as "sporting" Manhattan is concerned.

It must be understood in the beginning that there is no such thing these days as a prize fight. That is old stuff and belongs to the period when pugilists fought with bare knuckles or skin-tight gloves which had the cutting power of a razor. Heenan, Morrissey, Kilrain Sullivan, Mitchell, Fitzsimmons, and Peter Jackson were "fighters." The midgets and the giants who wallop each other in public nowadays are never, never "fighters." Their designation depends on the law of the state or city where they happen to be performing. Where athletic events are permitted within the squared circle, pugilists are "athletes." Where "boxing contests" are sanctioned by statute, they are "boxers."

Prize Fights Camouflaged as "Boxing Contests"

FOR example, when Mr. Jack Dempsey had a dispute with padded gloves at the Polo Grounds last summer with Luis Angel Firpo, the Wild Bull of the Pampas, everyone who read of the affair knew that a knockdown, drag-out fight was in sight. But since the law of the State of New York forbids prize fights and permits "boxing contests," the million-dollar festivity was camouflaged by the press and the promoters as a demonstration of boxing skill between Mr. Dempsey and the Angel Child of the Argentine. So when Mr. Dempsey was smashed through the ropes by a pile-driving blow delivered by Mr. Firpo, it was only a point scored in the latter's favor by the judges and the referee. And when Mr. Dempsey was helped up out of the laps of the spectators into which Mr. Firpo's "boxing" craft had punched him and proceeded immediately to knock the representative of South America into costly unconsciousness, he was only exhibiting his finesse as a master of offense. It was only after the money had been collected and the gathering dispersed that either promoters, newspapers, or "sporting men" forgot their lines and spoke of the function as "the greatest fight ever staged."

It must be plain, therefore, that whatever legislative action may take place which will spoil the boxing graft, it cannot be on the grounds of prize fighting. Even state lawmakers cannot perform impossibilities. They cannot destroy what does not exist and to such a depth of national hypocrisy have we fallen, that we still refuse to call things by their proper names. There are no such things as "prize fights" either in Manhattan or outside of it. There are only "boxing contests" in which men are bloodied beyond viewing, knocked into unconsciousness, and occasionally killed—all that a few parasites, mostly aliens, may live on the best without earning the meanest, and that our prehistoric blood lust may be appeased. Unlike the barbarian who was proud of his animal achievements, we are so cowardly that we refuse to mention our bad habits by name.

Strange to say, the agitation for the stoppage of the fight graft in Manhattan does not come from that indeterminate group called the "Blue Law fanatics." Any person who attempts to kill petty larceny theft (which our slanguage calls "graft") is in the eyes of the grafter or the larceny thief, "a Blue Law Fanatic." He is responsible for everything which the individuals, whose sole idea of liberty is to make money off somebody else without working too hard, describe as "the limitation of personal liberty." For once, however, the B. L. F. is admittedly unconcerned in the repeal of the Walker Law. And that is the reason why the "sports," who illumine The Great Shine Way, are frightened. It is, or has been, practically easy to defeat any movement calculated to protect the public morals or the public pocketbook by dragging the red herring of Blue Law fanaticism up and down the trail of the discussion. All that it has been necessary to do has been to shout "Reformer! Reformer!" when the "graft" was endangered and the hordes of License gather round the battle flag. Birth controllers, motion picture panders, race track gamblers, "Wet" advocates, newspapers, producers of threaticals and publishers of pornographic books all answer to their names when the sentinels of Graft sound the warning.

It is a different matter when gang fights gang with the politicians acting as the guerillas for the interested parties. In the "boxing" row not only are the disgruntled and the embittered partisans of the game involved, but a number of other people whose interest is somewhat less intimate.

A group of politicians which is outside the existing monopoly is bent on destroying the monopolists even if they have to kill "boxing" to do it. With them it is a case of "Let us in on the core or there ain't going to be no core." And hell hath no fury like a politician cheated out of his rightful whack of the loot.

Since the Walker Law was passed, the Temple of Swat for Manhattan has been Madison Square Garden, which is leased by Tex Rickard. Who his associates are is not public property but it is alleged that they are of sufficient importance to enable the Garden to remain the only big "boxing" club in the city. Every match of importance is held there, the biggest stakes are offered there, the champions, with few exceptions, box for Rickard and for Rickard only. There are some scattered arenas where "contests" are held but the contestants are the small fry of the fighting sea and they exist simply because on the nights for which they have "cards" the Garden is dark. Not only does Rickard stage the only important indoor exhibitions but he dominates completely the outdoor affairs which are the really great money makers. Justly or unjustly he is said to be the Boxing Trust of Greater New York and Brooklyn, and he has made enemies by reason of his alleged control of the "sport."

Attempts have been made at intervals to secure the state armories for "boxing clubs" which is the name under which the fight graft is known in Manhattan and New York State. No fight can be held legally unless in a place and by persons licensed by the state boxing commission. Naturally if there is only one big club there will be only one place where big contests can be held and only one place where lovers of the "manly art of self-defense" (that phrase was coined by a press agent for a fight promoter) can witness displays of that art. The man who controlled that club would control "boxing" and the gold mine which lies under it. Inversely, if "contests" could be held in the armories, which are big enough to house a profitable crowd, "opposition" to the only existing big club would become both serious and common since there are half a dozen armories in which lucrative "cards" could be staged. All of which is mere reasoning. What happened is that permission to use the armories as homes for "boxing clubs" was refused by the authorities and the Garden remained the only place in Manhattan where blood lovers could get a good meal of their favorite dish. Under the circumstances it is not unnatural that the gentlemen who tried to secure the armories should blame Rickard and his associates for their failure. It is not further unnatural that they are out to get revenge through the repeal of the Walker Law which will put Rickard out of business instanter.

The Public—Alias for Secret Identity

ANOTHER coterie which is supposed to be back of the attack on the boxing game is that indefinite entity known as the Public, which is an alias for anyone who wants to keep his identity secret. The Public has been charged extortionate prices for admission to the Garden, so the Public declares. For championship affairs like the "boxing" exhibition between Messrs. Johnson and Renault (from which the former has just recovered) the prices run from $3.30 to $25 Ordinary programs bring from $1.10 to $11.00 for tickets. In both cases the best seats, in some mysterious way, fall into the hands of speculators who get all the traffic will stand. The Public suffers and the Public therefore demands that the Walker Law be repealed or the prices of admission be fixed at a scale which will mean the same thing.

Still another factor has forced public consideration of the graft. That is the succession of astounding decisions rendered by the judges of the contests, the conduct of the "weighing in" process by the officials concerned with that department of the "sport," the summary treatment of the representatives of the press, and the presence and activities of gamblers at affairs which are, according to the law, only presentations of bodily skill connected with mental co-ordination.

When Benny Leonard and Lew Tendler, the two Jewish exponents of boxing art in the lightweight division, weighed in before the minions of the boxing law, the newspapermen were excluded from the room although the law says that the "weighing in" shall be done in public. Observations had been made that neither Leonard nor Tendler could make the lightweight limit without sawing off a leg apiece, and to prove that they could tip the scales at 135 at two o'clock in the afternoon of the "contest," reporters were kept in outer darkness so they could not look at the beam. Such an uproar was made over that beautiful piece of manipulation that since that time the weighing has been done publicly and will continue to be so done until another match of equal importance is staged.

In the Bernstein-Dundee contest for the junior lightweight championship there were features which still reek in the hardened nostrils of Manhattan. Bernstein was the champion as the result of an open-air fight in which the consensus of disinterested opinion gave Dundee the decision by a wide margin. Bernstein is a Jew and Dundee an Italian. A return engagement was made, this time indoors, between the two men. Bernstein as the champion was the favorite in the betting at odds of eight to five up to a few hours before the contestants entered the ring Then the odds suddenly switched and at the ringside Dundee was the favorite at the odds of six to five. After a weird contest in which Dundee by the consensus of opinion lost the decision by ten miles, he was declared the winner. So unjustified was the verdict of the judges, two of whom sit outside the ring while the third officiates inside as the referee, that even the hamstrung newspapers took up the hue and cry.

So great was the criticism of that "boxing" event that at the next contest the two outside judges were put on one side of the ring, the morning newspapermen on another side so their comments could not influence the judges, and the rest of the journalistic observers were scattered throughout the Garden where they could do everything but see the "contest."

Booing and howling at the verdicts of the judges has become a regular feature of the entertainments at the Garden. On more than one occasion the judgment of one "contest" has been booed halfway through that which followed it, so that it was impossible to determine whether the blood lovers were roaring disapproval at the boxers in the ring, or the gentlemen who decided the outcome of the preceding mill.

Stipend for Boxing Soars to Millions

WHAT really underlies the agitation against the "sport" is the contemptuous attitude assumed by its adherents to all considerations of decency. People starve, living expenses soar, and human beings suffer privation. On top of these conditions and in the face of them, a hulk of humanity called a "champion" refuses to pummel another hulk, who wants to be the "champion," unless he gets half a million dollars for doing it. Less important bruisers refuse to contribute their services to the cause of "boxing art" unless they get a stipend for one night equal to the salary of the President of the United States for a year. The managers of "boxers" talk in hundreds of thousands. The promoters of "contests" scorn the consideration of anything but millions. A cauliflower-eared, alien-born illiterate, a Jewish mental defective, or a half-brute foreign immigrant who can scarcely speak English, will appear in public for forty-five minutes for twenty-five thousand dollars or a percentage of the gate receipts that will amount to more. For what? That the lowest elements of a city, the scum of a state, the refuse of a nation, may enjoy imitation of the Coliseum in Rome any time during the most decadent days of the Empire. Stripped of all its grand pretense, the "boxing" game is nothing but the sight of one man trying to smash another into unconsciousness and being paid to do it by a mob of howling sadists, who, being cowards themselves, are the first to detect the symptoms of faintheartedness in the fighters, and the loudest to yell their discovery to the world.

There are three things in this world which can never be mistaken for anything but what they are. One is the rumble of a circus wagon wheel. Another is the sound which rises from the feet of marching men. The third is a crowd gathering for a prize fight—pardon, "boxing contest." And of the three, the last is truly unique. It is the same the world over. It has always been the same and it will always be the same. If there are "boxing contests" on Mars, the Martians who support them will look and act and appear just the same as the devotees who swarm to Madison Square Garden the nights when Manhattan screams "To the lions! To the lions!"

The type is invariable. Fierce eyes burning under the long peak of a cap. Raucous voices, angry jostlings, ugly arguments, whispering knots along the gutter's edge. Undeveloped bodies, puny physiques, sickly faces. Oily prosperity, sleek hair, flashy clothes, diamonds, Abes, Jakes, Moes on one side of the Garden. Snarling at the high-priced ticket windows! Wrangling with ticket speculators in almost every tiny candy store, fruit shop, or tobacconist coop which dots the side streets.

On the other side of the Garden more caps, rougher clothes, fiercer eyes, angrier arguments, sporadic fist fights for places in the ticket line, more Abes, more Jakes, more Moes, all clamoring for the smell of the arena and the sight of blood. No boxing contest in Manhattan is complete without its quota of women observers. At affairs like the Leonard-Mitchell, and the Dempsey-Firpo battles the feminine leaders of Manhattan's smartest society were present en masse. And near enough to acquire a souvenir splash of crimson for their pains. No one thinks anything about it unless perhaps it is the fighters themselves. Being abysmal brutes they may feel that, in this particular instance, woman's place is in the home. One might expect that the ladies who scream for a knockout to be delivered, who never look away from the sight of a man floundering in a bloody daze around the ring "punch drunk" as the patois of the "sport" has it, and who screech furiously when the decision of the judges goes against their opinion, would belong to what the sentimental novelists call "the scarlet sisterhood."

Quite and altogether on the contrary. They are women of leisure, means, and "indubitable respectability" who are under the guardianship of husbands brothers or sweethearts. Students of history might find in their presence at the ringside the same signs of degeneracy which brought the maids and maidens of patrician Rome to the gladiatorial combats. They might also point out that the moral disintegration of the women of any nation indicates the beginning of the end for that nation.

Meantime Frankie Jerome has been killed! "Sporting" Manhattan's only concern now is lest the "sport" he died participating in may be finished also. Why should it be? Isn't there money to be made in it? Money talks! Sometimes it rattles—like the bones of dead men. But Manhattan should worry about that!

Mr. Ford's Page

THE invention of methods by which to stop war has become one of the thriving businesses of the times. The amount of energy and money that is being spent upon plans and programs and propaganda and pronouncements indicates that the moving power is not merely a hatred of war or a love for peace. War has always been hated and peace has always been loved, but never before has there been such a completely organized system embodying these ideas, nor so many people associated with it, most if not all of whom are on a pay roll.

No one in his senses would say other than that war is the supreme social folly, but people of ordinary common sense would incline to the opinion that if war is to be preached against anywhere, it should be in those places where war is still believed in and where it is most likely to break out. To make the householder a pacifist while the robber still continues predatory, is hardly the way to go about the business. To make pacifist the nation that has nothing to gain and much to lose by war, while leaving warlike the nation which has everything to gain and nothing to lose by war, is hardly good management. The remedy should be turned on where the disorder is most acute.

> *WAR will not be prevented by "plans"; only knowledge can do that. The first knowledge to be gained concerns the men who have power to cause war on this globe. War does not spring from the people, nor even from the military men, but from a small and hidden group of international financiers, all of the same race, who win wealth and power as a result of war. There are fifty or sixty men in the world—just enough to fill a small prison—whose capture and restraint would free the world from the peril of war. Why not offer a prize for the discussion of war from this angle? Why not invite competitive essays on the actual persons who cause war? Every great crime must be planned, and the planners must be human beings. Why not start a movement to get down to the basic facts?*

If the peace propaganda could be carried into France, or into Germany, or into Italy, or any of the other countries which still believe that the sword is the settler of principles, some result could be looked for. At least the evangelists of the peace idea would soon discover that they were where their preaching was needed, whether it was received or not. But what is to be gained in the United States, aside from forwarding some other propaganda under the guise of peace propaganda, is difficult to see. This nation is agreed on peace. This nation is not going to break the peace. This nation supported the first international instrument of peace ever set up. This nation will never provoke another nation to break the peace. Why limit the preaching of peace to this country? Is it not needed elsewhere?

But it is not this alone that arouses a sense of the ineffectiveness of what is being done. The fact is, there is a lack of frankness about the whole matter. No one is told *who* causes war. No one dares to tell why war is caused. While it is conceded that war is not like the weather, beyond the control of mankind, but is man-caused and therefore may be man-controlled, it is never asked who are the men with whom war begins.

No peace prize competition ever asks for answers to the question: "Who are the men, alive today, who have power to cause a war?" No one hangs up a large sum in cash for correct and provable answers to the question, "What is the race, what is the business of the men who make the biggest profit out of war?" These questions are not popular, their answers are not permissible, and the whole discussion of peace, therefore, is reduced to a rustle of paper, and a maze of writing.

Now, when a great crime is committed, someone commits it. When a great crime is planned, someone plans it. It is impossible to charge a tornado or a volcanic eruption to any individual or group of individuals, but it is not impossible to trace the human sources of a war.
